BATTERY

The battery is so important a unit of the electrical equipment of the automobile that it deserves particular attention. It may be discharged or destroyed through failure of any of the electrical units, and will then cause the failure of the entire electrical system. For this reason the battery is the proper place to begin testing.

Battery failure may be caused by age since the demand on the battery is strenuous and its average life when used for starting and lighting is only fifteen months to two years. A defective starter or generator will cause rapid discharge or result in a constantly undercharged battery which will affect the condition of the plates and cause the battery to break down.

CAUSES OF DISCHARGE:

1. Unusual Operating Conditions.

Driving car at night or on short trips with constant use of the starter. For directions in changing the charging rate, see page on particular car in the REED SERVICE MANUAL. In regulating the output a test ammeter should be inserted in the line at the generator terminal. The dash ammeter is not accurate enough for this work, since it does not indicate the current taken by the ignition.

2. Shorts or Grounds in the Lighting or Ignition Circuit.

Check for grounds by noting the dash ammeter with all lights off and the engine stopped. Pointer should indicate 0. A discharge indicates ground which locate as directed in "Lighting Circuit" section.

3. Defective Starter.

Starter may draw excessive current. Check starting circuit as directed in section on "Starting."

4. Defective Generator.

If generator does not charge connect a test ammeter in the generator circuit at the generator terminal and check output against the figures given on the car data sheets in the REED SERVICE MANUAL, by operating the generator at various speeds.

On cars using relay, battery may be discharging through the generator windings at low speeds, if the relay contacts do not open. Note ammeter reading at low speed (below 6 miles an hour) with lights off. Reading should not be greater than 1 to 2 amperes. If reading is greater check relay as directed in "Generator" section.

5. Too Many Accessories.

The addition of spot lamps, signal lamps, cigar lighters, and wind-shield wipers may cause a discharge rate higher than the charging rate of the generator. Correct by increasing the charging rate.

6. Internal Defects.

Cracked or leaky battery jars or internal short circuits will cause battery to discharge. If the battery plates are sulphated, battery will not hold charge. Open and inspect battery.

BATTERY TESTS:

1. Hydrometer Test.

All hydrometer tests should be made with a battery solution temperature as nearly 70° F. as possible since the figures given are standard at this point. Check hydrometer reading against following table.

1275 to 1300—Fully charged cell.

1200 to 1225—Practically discharged cell.

1150—Discharged cell—may be sulphated. Should be immediately charged.

To obtain correct hydrometer reading when battery solution temperature varies from 70° F. use following table:

When solution is		50° F. subtract	8 points from hydrometer reading.	
"	"	55° F.	"	6 " " "
"	"	60° F.	"	4 " " "
"	"	65° F.	"	2 " " "
"	"	75° F.	add	2 " " "
"	"	80° F.	"	4 " " "
"	"	85° F.	"	6 " " "
"	"	90° F.	"	8 " " "
"	"	95° F.	"	10 " " "
"	"	100° F.	"	12 " " "
"	"	105° F.	"	14 " " "

The battery solution temperature should never exceed 105° F.

A discharged battery where cells vary by less than 50 points is probably O. K. On a charged battery variations in cell readings should not be great. If there is a considerable variation or if the readings vary by more than 50 points on a discharged battery examine for internal short circuit, defective plates, cracked jars or doped electrolyte. Do not add acid or quick charging dope to the solution. If this has already been done, hydrometer reading will not be correct as a reading of 1300 might be secured from a totally discharged battery. In such cases battery must be completely charged and solution adjusted by adding distilled water until the specific gravity is brought down to 1275-1300.

2. Voltmeter Test.

If the electrolyte level is below top of plates where it cannot be reached by hydrometer, or if battery is suspected to be defective, a voltmeter test should also be made.

Turn on lights or connect resistance across the battery so that discharge current is approximately 5-10 amperes. Connect voltmeter across cell terminals. If cell is in perfect condition readings should be

2.1 to 2.2 volts—Fully charged cell.

1.8 volts—Practically discharged cell.

A cell giving a reading that varies by more than .1 volt from the others is probably defective and should be examined and given a Cadmium Test.

In general the voltage of a cell that is in order will not fall more than .1 volt, when beginning to discharge at the 5 ampere rate. A greater drop indicates a discharged cell, while a rapid drop or reversed reading indicates a cell that is out of order.

3. Cadmium Test.

The Cadmium Test can only be made while the battery is being charged or discharged and will check internal trouble in the cells. If test is made while the battery is on charge this should be done at the completion of the charge with the charging current at the finish rate.

If test is made while the battery is on discharge this should be done when the discharge is practically completed at the 5 ampere rate.

If no readings are secured in the Cadmium Test an internal short circuit probably exists.

Fasten a stick of cadmium to the side of a prod. Attach prod lead to the negative (—) terminal of a special voltmeter which is calibrated to read —.2 to +3 volts and fasten the lead from the other prod to the plus (+) terminal of the voltmeter. Insert the cadmium stick into the battery solution, being careful not to touch the plates. Touch the other prod to the negative (—) and positive (+) terminal posts of the cell, and check the voltmeter reading with the following tables:

a. Table for Battery on Charge

Positive (+) Prod.	Voltmeter Reading	Indication
On (+) post of cell.	2.35-2.45 volts	Positive plates O. K. and fully charged.
On (+) post of cell.	Under 2.34	Positive plates probably defective
On (—) post of cell.	— .1 to — .2 volts	Negative plates O. K. and fully charged.
On (—) post of cell.	Less than — .1 or positive	Negative plates probably defective

The ignition circuit consists of the battery, ammeter, ignition switch, coil, breaker contacts, condenser, distributor, spark plugs and the wires used to connect the low and high tension lines.

Ignition trouble consists of: (1) Missing caused by mechanical trouble or weak spark; (2) loss of power and poor acceleration caused by faulty timing; (3) complete failure of the ignition system preventing the engine from running.

If engine misses, locate missing cylinder by running engine on two cylinders alternating until missing cylinder is found. Check condition of spark by holding the spark plug lead 3/16 inch from ground. The spark should jump regularly as the engine is turned over. If it does ignition is O. K. Then check engine for fouled or cracked spark plugs, incorrect spark plug gap setting, weak compression caused by sticking valves or

If the cadmium test indicates that the plates are fully charged, the specific gravity of the solution should be 1275 to 1300. If it differs from this the solution should be adjusted to give this figure.

b. Table for Battery on Discharge

Positive (+) Prod.	Voltmeter Reading	Indication
On (+) post of cell.	2.05 volts	Positive plates O. K.
On (+) post of cell.	Less than 2. volts	Positive plates probably defective
On (—) post of cell.	.25 volts	Negative plates O. K.
On (—) post of cell.	More than .25 volts	Negative plates probably defective

In order to check the capacity of the battery, multiply the number of hours over which the 5 ampere rate was secured by the discharge current. The resulting capacity in ampere hours should be compared with the data given on that particular battery in the REED SERVICE MANUAL.

4. High Amperage Test.

Before sending the battery out of the shop, it is advisable to give it the high amperage test which is made for the purpose of checking the condition of the battery plates and separators, and determining whether the battery will hold the charge and perform satisfactorily when installed on the car.

Connect a resistance across the battery terminals and take voltage readings across each cell while current is flowing. The resistance unit should allow approximately 25-30 amperes for each positive (+) plate of the cell or 150-200 amperes for an ordinary 13 plate battery. (A 13 plate battery has 6 positive (+) plates and 7 negative (—) plates.)

The readings of the cells should not vary by more than .1 volt. If one cell differs from the others by a greater amount it should be closely examined. The voltage of a fully charged battery should not fall below 1.7 volts.

Feel the cell connectors after the current has been discharging. Poorly burnt connections will be hot to touch.

BATTERY IGNITION

worn cylinders and pre-ignition caused by carbon deposits. If spark is weak or jumps irregularly test ignition system as directed in following table.

If missing cylinder cannot be located, test spark by holding high tension lead from coil to distributor about 3/16 inch from engine block while cranking engine. If spark tests O. K. check distributor head, rotor button and spark plug cables.

Causes of Engine Missing.

1. **Loose connections in the ignition circuit.** Check the connections at ammeter, ignition switch, coil and breaker. See that condenser pigtail connection is tight.
2. **Short circuited primary or open circuited secondary in the ignition coil.** Test on the bench if spark is weak and no other cause can be discovered.
3. **Wrong breaker contact gap.** Check and adjust as directed on car data sheets in the REED SERVICE MANUAL. If breaker gap is too small en-

gine will miss at low speeds. If too large it will cause missing at high speeds.

4. **Burnt breaker contacts.** Resurface contacts or replace as directed in section on "Distributors."
5. **Weak breaker arm spring.** If weak the spring will not close the contacts at high speeds. Check tension with a small spring balance and replace breaker mechanism if found defective.
6. **Defective condenser.** A leaky condenser will cause missing. An open or short circuited condenser will cause complete failure of the ignition system. Test as directed in section on "Condensers."
7. **Worn cam.** A worn cam may cause irregular firing and missing at high speeds. Check and replace.
8. **Wear in the distributor shaft.** Check for wobbling. If shaft is worn replace it.
9. **Play in advance mechanism.** Causes irregular firing.
10. **Defective distributor rotor.** If bent or burnt it should be replaced.
11. **Glazed or burnt rotor track or bent contacts.** Clean as directed in section on "Distributors."
12. **Defective insulation in high tension leads.** Examine for chafed or burnt insulation permitting current leaks to ground. Replace the defective leads with high tension cable.
13. **Wrong secondary connections.** Check firing order as given in the REED SERVICE MANUAL.

If engine lacks power, check timing as directed in section on "Timing."

If engine will not run, test spark by turning on ignition switch and watching ammeter as engine is turned over. The dash ammeter should register 2-4 amperes with the engine stopped and all lights off. The current flow may reach 4-6 amperes momentarily but should cut down within a few seconds due to the heating up of the ballast resistor. If the breaker arm is on the high point of the cam no discharge will be shown until the engine is turned over. On systems using the open circuit principle no discharge will be shown until the contacts are closed by the breaker arm reaching the high point of the cam.

Check ammeter against following table as engine is turned over.

1. **No ammeter reading.** Primary connections are loose. Primary winding or ballast resistor is open. Breaker contacts are defective, breaker arm stuck or spring weak or broken. Check battery. If lights burn battery is O. K. Touch primary lead at coil to ground momentarily. If flash is secured ignition switch and primary lead are O. K. Test coil and breaker as directed in following sections.
2. **Ammeter reading 2 amperes steady.** POINTER DOES NOT SWING BACK TO 0 AS ENGINE IS TURNED OVER. Breaker contacts are shorted or condenser is punctured. Examine and test as directed in following sections.
3. **Ammeter reading higher than 4 amperes.** POINTER PERIODICALLY SWINGS TO 0 AS ENGINE IS TURNED OVER. Primary winding or ballast resistor is

shorted. Test on the bench as directed under "Ignition Coil."

4. **Ammeter reading higher than 4 amperes.** POINTER REMAINS STEADY—DOES NOT SWING PERIODICALLY. Primary leads or primary winding are grounded. Examine leads and test coil.

IGNITION COIL.

The internal circuits of the ignition coils differ with the different electrical manufacturers and can be checked by referring to the car diagrams in the REED SERVICE MANUAL. In general the secondary winding is connected to the primary winding or is grounded to the coil shell. The condenser may be enclosed in the coil shell. Test as follows:

For Open Circuit.

Test primary winding with a test lamp placing one test lead on each of the primary terminals. The lamp should light. If it does not the primary is open. Test secondary in the same way. Due to high resistance the lamp will not light. Small sparks should be visible when the circuit is broken.

For Short Circuit.

Test primary winding for short circuit by connecting the coil in series with an ammeter to a six volt battery. Excessive current flow indicates short circuits in the primary. See that current flow is not caused by shorted ballast resistor. Test resistance unit with the lamp and test points. It should never be connected across the battery. Short circuits in the secondary can only be checked by noting the spark while running a performance test on the bench. A weak spark then indicates defective secondary winding.

For Ground.

Test for ground by placing one test lead on the primary terminal and the other on the coil base. The lamp should not light. If it does the primary winding is grounded. If the condenser is in the coil shell, a punctured condenser will also cause the lamp to light.

Final Service Test.

Connect the coil to a breaker setting the gap as given on the particular system in the REED SERVICE MANUAL and connect secondary circuit to an air gap of approximately $\frac{3}{8}$ inch between needle points. Connect a condenser known to be O. K. across the breaker contacts. If the condenser is in the coil check by alternately using one condenser and the other.

Operate the coil for at least an hour allowing it to become thoroughly heated. Check the current consumption and the condition of the spark throughout this time. They should not vary. If spark is O. K. when test condenser is used but is faulty when coil is run on its own condenser, the condenser or coil must be replaced. If spark is faulty under all circumstances secondary circuit is defective and coil must be replaced.

CONDENSER.

The simplest method of testing the condenser is to substitute a condenser known to be perfect and check coil operation. In making this test the suspected condenser should be disconnected from the circuit.

Condenser tests should be made as follows:

- For Short Circuits.** Test with lamp and test points. Disconnect condenser or insulate breaker contacts by placing a piece of cardboard between them. Then place one test point on each of the condenser leads. The lamp should not light. If it does the condenser is shorted.
- For Open Circuits.** Place one test point on condenser terminal and touch other test point to the other condenser terminal. If condenser is perfect small sparks will be visible when the circuit is broken. If this test is made with alternating current the sparks will not be visible every time the circuit is broken.
- For Grounds.** Disconnect condenser leads and place one test point on condenser case and touch other test point to condenser lead. The lamp should not light. If it does the condenser is grounded.
- Capacity Test.** Connect the condenser to the center poles of a D. P. D. T. switch and connect it in series with a voltmeter to a 110 volt D. C. line. Connections must be made so as to reverse the direction of current flow every time the switch is thrown. Check the voltmeter reading when the switch is thrown and compare this reading with the figures obtained by previous tests with a perfect condenser. **This test can not be made with A. C. current.**

DISTRIBUTOR.

See that distributor head is clean and free from oil. The rotor track should be smooth and glazed. Wipe out distributor head with vaseline or heavy grease removing all excess and polishing rotor track with a soft clean cloth. See that rotor button is making firm contact and that the carbon brush is free to move in its holder. On distributors using the jump-spark principle see that contacts are not burnt or out of line and that rotor button rotates freely.

BREAKER.

Breaker contacts are usually made of tungsten. The surface of the contacts should be gray, flat and smooth. Badly burnt or blue contacts may be caused by a defective condenser. Check operation of breaker as follows:

- Wrong Contact Gap.** Check contact gap opening with figures given on the car data sheet in the REED SERVICE MANUAL. **These figures are recommended by the manufacturers and should be closely followed.** To set gap place breaker arm on high point of the cam and set movable contact to give proper opening. This distance should be set with a feeler gauge.
- Burnt Contacts.** If contacts are not parallel or are burnt resurface on an oilstone or with a fine flat contact file. If they are badly burnt or pitted they should be replaced. Check contact opening after resurfacing contacts.
- See that breaker arm spring has sufficient tension to close contacts quickly. The spring tension should be

Weak Breaker Arm Spring.

approximately 15-20 ounces. It may be tested with a small spring scale by lifting the breaker arm from the cam and noting the force required at the instant the contacts separate.

Worn Cam.

Check cam for irregularities in wear by checking contact opening on each high point of the cam. If the opening is not uniform the cam should be replaced.

Defective Advance Mechanism.

Make certain that manual advance lever is connected to the breaker mechanism and correctly working. Check for play or lost motion caused by wear. If automatic advance is used see that advance mechanism operates freely with no great amount of lost motion

Worn Distributor Shaft.

Check distributor shaft for wobbling caused by insufficient lubrication and consequent wear. If there is excessive play the shaft or distributor housing must be replaced.

Grounded Contact.

Test insulated contact for short to ground with the test lamp. Disconnect coil lead and insulate contacts by placing a piece of cardboard between them. Then place one test point on the insulated contact and touch the other test point to the breaker frame. The lamp should not light. If it does the insulated contact is grounded and must be repaired.

TIMING.

Manufacturers issue special instructions on timing. **These are given on the car data sheets in the REED SERVICE MANUAL and should be closely followed.**

Causes lack of power, sluggish acceleration and overheating of the engine.

Late Timing.

Check automatic advance mechanism for binding sub-shaft or sticking weights. Check manual advance rod for positive connection to breaker housing. On systems using movable cam for timing check cam for slipping. Check rotor and see that pin holding distributor rotor is not bent.

Causes backfiring in starting, knocking when rapidly accelerated and lack of power.

Early Timing.

Check automatic advance mechanism for weak or broken springs. Check manual advance rod for positive connection. Check cylinders for carbon deposits causing pre-ignition.

To check timing proceed as follows:

Single Contact Systems.

Insert a six or twelve volt lamp in the primary circuit at the breaker or connect the lamp across the breaker contacts. The lamp will go out when the contacts open. If connected across the contacts the lamp will light when the contacts open. Check position of engine with data given on particular car in REED SERVICE MANUAL.

Where double contact system is used they must be synchronized so that both contacts open at the same instant. Check as in the single contact system.

If breakers are connected in parallel in the primary circuit connect the test lamps across the breaker contacts. The lamps should light at the same instant.

Double Contact Systems.

If breakers control separate primary circuits connect lamps in circuit. The lamps should go out at the same instant. If connected across breaker contacts lamps should light at the same instant.

If contacts do not separate at the same instant adjust by loosening one breaker mounting plate and shifting until both breaker arms are on the high point of the cam. Check posi-

Systems Using Two Contacts Opening Alternately.

tion of engine when contacts separate with data given in the REED SERVICE MANUAL.

ON 90° ENGINES. Test as directed for single contact systems. Contacts open at intervals of 45°. Check by fly-wheel markings or by marking firing intervals of 45° on a scale which will fit within the distributor housing. Check rotation of distributor shaft between contact openings by noting position of the pin or a mark made on the cam.

ON 60° ENGINES. Test as directed in previous paragraph. Breaker contacts separate at intervals of 30 and 60° corresponding to periods of 60 and 120° of crankshaft rotation.

This type of ignition is used on some of the new straight eight engines.

MAGNETO IGNITION

Magneto ignition systems are of two types. Straight magneto ignition consists of a high tension magneto with ground switch to control circuit. Dual or duplex systems use high tension magneto with battery attachment for starting. Battery circuit has separate coil and breaker and uses magneto distributor and spark plugs or may use magneto windings to generate secondary current.

If engine fires irregularly, locate missing cylinder by shorting out two cylinders at one time and running engine on remaining cylinders. If missing cylinder is located check condition of spark by holding spark plug lead 1/4 inch from cylinder block while turning over engine. If spark jumps regularly and is blue in color ignition system is O.K. and trouble is caused by condition of engine. Check spark plug for leak, fouled contacts or gap set too wide. If gap is incorrectly set spark may jump at safety gap in magneto, causing engine to miss.

Check for:—

DEFECTIVE DISTRIBUTOR BRUSHES AND ROTOR TRACK. Check carbon brushes for proper contact and wipe off rotor track with heavy grease, polishing with clean cloth.

If Magneto Spark Weak, Causing Engine to Miss.

BURNT CONTACTS. Resurface with worn No. 00 sandpaper or flat contact file, as magneto contacts are of platinum. Set for proper opening in accordance with figures given on particular system in the REED SERVICE MANUAL. If gap is too wide engine will miss at high speeds. If breaker gap is too small engine will miss at low speeds.

DEFECTIVE CONDENSER. If breaker contacts are badly burnt or pitted examine condenser for loose connections or open circuit. Check by connecting test condenser across contacts and noting condition of spark. If spark is O.K. magneto condenser must be repaired or replaced.

WEAK MAGNETS. Weak magnets will cause missing at

low speeds or while pulling heavy load and cause hard starting. They are caused by constant use or removal from the magneto without the protection of a keeper. Check by rotating magneto by hand, noting force required to turn armature over point of maximum inductance. If no point of distinct resistance is felt or if resistance is less than that of a perfect magneto, recharge magnets on regular magnet recharger. Recharge magnet with same poles as originally charged, placing north pole of magnet on south pole of charger. Use compass to check this condition. Allow magnet to remain on charger for several seconds, tapping magnet lightly to assist process. Place a keeper or flat bar of iron across magnet poles before removing from charger and do not remove keeper until magnet is in contact with pole piece of magneto. This is important to retain the magnetism. In replacing magnets make certain that all magnets have like poles together. Check with compass. A reversed magnet will cause weak spark. RECHARGING FORD MAGNETS. Magnets on Ford magneto can be recharged without removing from car. Remove floor boards and disconnect lead from magneto terminal on flywheel housing. Place compass over flywheel, slightly behind terminal post and 1 inch to left. Then crank engine until north pole of compass points directly forward toward front of car. Connect two six volt batteries in series, connecting positive lead to magneto terminal. Then flash negative lead to engine block or flywheel case several times to insure proper magnetizing of the coils.

WEAR IN MAGNETO BEARINGS. Check magneto for wear in the bearings or excessive end play, permitting increased air gap between armature core and pole pieces. This

will reduce intensity of magnetic flux and cause weak primary current.

DEFECTIVE WINDINGS. Shorted primary and shorted or open secondary windings may cause weak spark. Disassemble magneto and test as directed below.

DEFECTIVE COLLECTOR RING OR BRUSH. Examine high tension brush and ground brush for proper contact. Check collector ring for punctured insulation, permitting current leak to ground, as directed below.

If engine stops suddenly or fails to start disconnect switch lead at magneto and crank engine. If engine fires switch lead or switch is grounded and must be repaired. If engine does not fire check spark by holding spark plug lead $\frac{1}{4}$ inch from ground while cranking engine. If spark jumps satisfactorily, ignition system is O. K. If no spark is visible check secondary circuit by removing high tension lead to distributor from terminal on distributor face and holding near ground. If spark is O.K. check distributor brush for proper contact, rotor track for burnt or pitted surface and spark plug leads for grounds. If no spark is found check trouble from following table.

BREAKER CONTACTS BURNT OR OPEN. Check breaker contacts for correct setting and proper condition. Resurface contacts and set gap as directed in REED SERVICE MANUAL.

**If No Spark at
Secondary Terminal.**

PUNCTURED CONDENSER. Disconnect condenser and crank engine. If system operates condenser is shorted and must be replaced. Do not continue to run without condenser or contacts will be burnt. On systems with condenser incorporated in armature assembly condenser lead is soldered to primary.

DEFECTIVE BRUSHES. Check primary contact at breaker and examine ground brush for proper contact. Check high tension brush and examine collector ring for punctured insulation, permitting internal short circuit of secondary current. Test by removing high tension brush, inserting small screw driver in opening, providing gap of $\frac{1}{8}$ inch to ground. Rotate magneto. If no spark jumps gap, collector ring is shorted or primary or secondary windings are open or shorted.

DEFECTIVE WINDINGS. Test primary winding after removing armature from magneto with lamp and test points connected to a six volt battery. Disconnect primary lead where grounded to core. Then touch one test point to each primary lead. The lamp should light. If it does not the primary is grounded. Touch one test point to primary lead and other to armature core. The lamp should not light. If it does the primary or condenser is grounded. Disconnect condenser lead and test separately. Test secondary winding with test leads connected to voltmeter in series with battery. Touch one test lead to secondary terminal and touch other to armature core. If reading is indicated on voltmeter scale secondary is grounded. Secondary leads must not be touching the armature core in making this test.

If engine does not stop when ignition switch is opened, switch or line from switch to magneto is open. Stop engine by short circuiting from switch terminal on magneto to ground. Check line for breaks or loose connections and examine switch for proper contact of switch arm.

LIGHTING CIRCUIT

The lighting circuit consists of the battery, ammeter, lighting switch, circuit breaker or fuses where used, the lamps, horn and other appliances, and the lines used in connecting them. Lighting circuit troubles are as follows:

Lighting Circuit Dead. Check fuses on lighting switch or in fuse block on dash. Do not replace blown fuses until lighting circuit has been tested for shorts and grounds as directed in sections following on "Lines and Switches." Check circuit for open connections examining lines at ammeter, lighting switch and junction block where used. Check for defective switch as directed in section following on "Switches."

Circuit Breaker Operating. Check lines for shorts or grounds as directed in section on "Lines."

Lights Dim or Flickering. Check for loose connections at ammeter, lighting switch, junction block and lighting socket. Test battery with hydrometer as directed in "Battery" section. Check for broken wires in lighting lines. Check fuse clips for positive contact.

Disassemble switch and examine switch contacts. If burnt resurface and reshape to insure firm contact.

Check charging circuit for loose connections causing high generator voltage as directed in section on "Generators."

If fuses blow or circuit breaker operates irregularly and lighting lines check O. K. look for an intermittent ground caused by vibration. Check lines for chafed insulation.

**Lights Flare Up
and Burn Out.**

**Fuses Blow
Irregularly**

Test lighting circuit as follows:

1. **LINES.** Test lighting lines with a lamp and test points first disconnecting car lamps to prevent their burning out. Turn the lighting switch to the "Off" position.

Place one test point on the line terminal being tested and touch the other to the car frame. The lamp should not light. If it does the line is grounded and must be repaired or replaced. Test lighting sockets by disconnect-

For Grounds.

ing lighting line and placing one test point on insulated contact and touch other point to frame after removing the bulb. The lamp should not light. If it does the socket is defective and must be replaced.

For Open Circuit. Place one test point on each end of the lighting line. The lamp should light. If it does not the line is broken and must be repaired or replaced.

2. **SWITCHES.** Test switch with lamp and test points to make certain that contacts are O. K. and that switch is correctly assembled. In testing switch remove fuse if still O. K.

Switch Circuits. Place one test point on battery terminal of the switch and touch other test point to switch terminals noting when lamp lights. The lamp will light when switch contacts close the circuit. Note position of lever and check circuits completed through switch with diagram given on the car data sheet in the REED SERVICE MANUAL. If lamp does not light when test point is touched to proper terminal as indicated by switch lever position, disassemble switch and examine.

Switch Contacts. Clean switch contacts and make certain that they make firm contact with the switch spider or arm.

Dimmer Resistance. If head lamps burn bright in both "Bright" and "Dim" positions dimmer resistance is shorted and must be replaced. If head lamps burn in "Bright" position but are dead in "Dim" position dimmer resistance is open, being disconnected or burned out. Examine and replace.

3. **CIRCUIT BREAKER.** Circuit breakers when used are mounted on the back of the switch or on the dash. Vibrating circuit breakers limit the current flow and produce a perceptible noise attracting attention to the system. Test circuit breaker by connecting it to a six volt battery in series with an ammeter. The circuit breaker should open the circuit at 25-30 amperes and continue with a current flow of 10-15 amperes. Test vibrating circuit breakers with a lamp and test points.

For Open Circuits. Place one test point on each of the circuit breaker terminals. The lamp should light. If it does not the coil is open and the circuit breaker is defective. It must be replaced.

For Short Circuits.

Place one test point on the circuit breaker terminal and touch the other to the frame. The lamp should not light. If it does the winding is shorted to ground and must be repaired or replaced.

Adjust Delco vibrating circuit breakers in accordance with the following instructions:

1. **Circuit Breaker Cuts Out With Greater Current Flow Than 30 Amperes.** Decrease length of plunger spring by cutting off a piece about 1/16 inch in length or file off end of plunger slightly.
2. **Circuit Breaker Cuts Out With Current Flow of Less Than 25 Amperes.** Increase spring tension by stretching it slightly or increase air gap between plunger and frame. The normal air gap should be .019-.025 inch.
3. **Current Flow Greater Than 15 Amperes With Circuit Breaker Operating.** Decrease air gap slightly by bending frame nearer to plunger disk.

Lockout circuit breakers may be used to protect the horn, handy lamp and accessory circuits. Test with lamp and test points as follows:

- Open Circuited Series Winding. (HEAVY WINDING.)** Place one test point on the battery terminal of the circuit breaker and other test point to either of terminals to which lamps are connected. The lamp should light. If it does not the heavy winding is open or the contacts are defective. With the test points in place separate the contacts. The lamp should glow dimly. If it does not the fine winding is open. It must be repaired or the circuit breaker replaced.
- Open Circuited Shunt Winding. (FINE WINDING.)**

In reassembling lighting circuits see that all connections are clean and tight and that lights are correctly wired. Test by placing switch in all positions and noting lamps lighted. Connect accessories to the terminal on junction block to which generator and ammeter leads are connected. If junction block is not used connect to switch side of ammeter or to battery terminal on switch. If connected to horn terminal on switch accessories will be protected by horn fuse where used.

After assembly test electrical system for leaks or shorts to ground by disconnecting battery ground cable and connecting voltmeter between battery and ground. With all lights off and engine stopped the voltmeter reading should be 0. A reading indicates grounds. In making this test all switches must be in the "Off" position. A closed switch will give a voltmeter reading even though no current is flowing in the line.

GENERATOR

Generating circuit consists of generator, relay or relay-regulator, ammeter, battery and lines used to connect these units. In normal operation generator begins to charge at 6-10 miles per hour and reaches its maximum at 25-30 miles per hour. If generator fails to charge battery satisfactorily check performance by watching dash ammeter while slowly speeding up engine. Check generator performance with following table:

Ammeter Does Not Indicate Charge or Discharge.

GENERATING CIRCUIT IS OPEN. Check for loose connections and broken lines.

DEFECTIVE RELAY. Check by bridging relay contacts by connecting short wire across relay terminals. If generator indicates charge, relay is defective or generator voltage is low. Test as directed below.

	DEFECTIVE AMMETER. Check by turning on lights with engine stopped. Ammeter should indicate 5-10 amperes discharge. If no discharge is shown check connections between ammeter and battery and ammeter and lighting switch. If connections are O. K. ammeter is defective and must be replaced. DEFECTIVE GENERATOR. Give performance test as directed below. REVERSED BATTERY OR AMMETER CONNECTIONS. Check by turning on lights with engine stopped. If ammeter indicates charge battery has been installed in reverse position or ammeter reversed. Check battery connections. If reversed change connections. If O. K. change ammeter connections. In generators using relay control, reversed battery may permit generator to build up with opposite polarity causing battery discharge or faulty relay operation. Change residual magnetism of generator by bridging relay contacts with wire for several seconds with the engine stopped. DEFECTIVE GENERATOR. Battery discharging through generator windings. Check generator for shorts or grounds by Motoring Test as directed below.
Ammeter Indicates Discharge.	
Ammeter Indicates Charge at Slow Speeds or for Short Interval Then Indicates Discharge.	DEFECTIVE RELAY-REGULATOR. Check regulator for open resistance coil. DEFECTIVE THERMOSTAT. Examine thermostat closely for bent arm or burnt out resistance. If defective, thermostat must be replaced.
Low Charging Rate. (Does Not Approach Maximum.)	LOOSE CONNECTIONS. Check generating circuit for loose connections at relay, ammeter, switch, and battery. DEFECTIVE GENERATOR. Check for internal defects by performance test.
High Charging Rate. (Exceeds Maximum or Does Not Decrease After Peak Speed Is Reached.)	DEFECTIVE RELAY-REGULATOR. Test relay-regulator as directed in section on "Relay-Regulators." GROUNDING THIRD BRUSH ARM. On third brush systems where field is connected to ungrounded main brush, grounded third brush causes generator to operate as a straight shunt machine. Test as directed in section on "Starter and Generator Internal Testing."

Test defective units of generating circuit as follows:

1. RELAYS.

Check relay operation by connecting voltmeter between generator terminal and ground or across generator terminals in a two wire system. Slowly speed up generator and note terminal voltage when relay contacts close. The voltage will drop slightly at this point. Check with data given for particular car in the REED SERVICE MANUAL. See that relay contact gap is correctly set. Check air gap between relay armature and coil core for correct clearance. This is important since the armature will stick if allowed

to touch the core and will not open the relay contacts. Correct figures for contact gap and air gap are given on each car data sheet in the REED SERVICE MANUAL. If relay closes normally but generator does not charge, series coil is open. If relay contacts do not close but generator charges when contacts are closed by hand, shunt coil is open or shorted. Test relay series coil (coarse winding) and shunt coil (fine winding) for open and shorts as follows:

Series Coil.	Test with lamp and test points. Place one test point on generator terminal and one on battery terminal of relay. Close relay contacts. The lamp should light. If it does not series coil is open. Repair or replace relay. Test for open circuit with lamp and test points. Place one test point on generator terminal of relay and touch other point to relay base. The lamp should light. If it does not shunt coil is open or series coil is open where shunt winding is connected to series winding at relay contact. Test for short circuit by connecting six volt battery across shunt winding. Check magnetism by raising relay armature with the hand. There should be considerable attraction between the core and armature. If little or no magnetism exists the shunt winding is shorted. Check condition of relay contacts. Burnt contacts may be caused by poor adjustment, improper relay setting allowing contacts to separate while carrying heavy current or reversed battery causing relay armature to flutter with constant breaking of circuit. Resurface contacts with worn No. 00 sandpaper and adjust contact opening.
Shunt Coil.	
Relay Contacts.	

2. RELAY-REGULATORS.

Generators using straight shunt field use regulators to control the current output. The relay and regulator are incorporated in one unit but usually have independent windings. Check relay of relay-regulator as directed in paragraph above. Regulators either cut a fixed resistance into shunt field circuit or vibrate and so limit the field current. Examine regulator resistance for open circuit caused by high generator voltage burning out resistance. Check condition of regulator contacts. High generator voltage or improper regulator setting will cause burnt contacts. Resurface with worn No. 00 sandpaper and adjust contact opening. To set regulator, operate generator with ammeter in circuit at generator terminal and voltmeter connected between generator and ground. Increase or decrease regulator armature spring tension until generator performance agrees with performance table given on car data sheet in the REED SERVICE MANUAL.

3. THERMOSTATS.

Thermostat may be connected in shunt field circuit and is mounted in the brush rigging. Thermostat contacts open at 165-195° F. cutting resistance in the field circuit. Examine thermostat for burnt out resistance unit or bent arm preventing correct operation. If thermostat is defective replace it.

4. GENERATOR.

Check generator by running performance test. If performance test is run on the bench more accurate results will

be obtained. Connect ammeter in generating circuit at generator terminal and connect voltmeter between terminal and ground or across generator terminals. A test ammeter must be used since the dash ammeter does not register current taken by ignition and is not accurate enough for this work. **Performance Test.** The generator when run on test must always be connected to the battery since the regulating action of the third brush depends on this. If run on open circuit the generator voltage increases until the windings burn out. Run generator at various speeds and record ammeter and voltmeter readings. Check results with test data given for each car in the REED SERVICE MANUAL.

DEFECTIVE DRIVE. Examine for slipping belt, sheared key or sticking or worn rollers in overrunning clutch where used. Disassemble clutch and clean with gasoline. Repack with vaseline or medium heavy grease.

OPEN FIELD OR REVERSED FIELD CONNECTIONS. Examine field connections at third brush and main brush or ground and check fuse clips for positive connection. Test field coils for proper polarity as directed in section on "Fields" under "Starter and Generator Internal Testing."

**Generator Dead.
(No Terminal
Voltage or
Amperage.)**

BLOWN FUSE OR BURNT OUT FIELD. Check field fuse or field winding where no fuse is used for damage caused by high generator voltage or shorts permitting high current flow.

WEAK RESIDUAL MAGNETISM. Bridge relay contacts momentarily by touching short wire from relay terminal to generator terminal. Current flow should not be greater than 2.5-5 amperes.

SHORTED FIELD COILS. Examine field for short circuits or grounds. If shorted field will draw excessive current. Test as directed in section on "Fields" under "Starter and Generator Internal Testing."

DEFECTIVE COMMUTATOR. Examine commutator for burnt or oily surface or high mica, as directed in section on "Commutators" under "Starter and General Internal Testing."

OPEN BRUSH CONNECTIONS. Check generator for internal open circuits at brushes and generator terminal. Check pigtail connections on brushes for positive connection.

SHORTED GENERATING CIRCUIT. Short circuits in generating line may prevent generator building up. Check line for discharge with engine stopped. Disassemble generator and examine.

OPEN CIRCUITED OR SHORTED ARMATURE COILS.

**Generator
Voltage Low.
(May Not Close
Relay Contacts.
Will Not Charge
Battery.)**

Cause low charging rate or complete failure of generator. Disassemble generator and test armature as directed in section on "Armatures" under "Starter and Generator Internal Testing."

SLIPPING DRIVE. Check generator for loose belt or defective overrunning clutch. Belt should be tight enough so that generator does not move when ignition switch is turned on or relay contacts are closed. If too tight belt will crowd bearings causing wear and heating of the shaft and armature.

REVERSED FIELD COIL. Causes weak field magnetism. Test with compass to check polarity as directed in section on "Fields" under "Starter and Generator Internal Testing."

RESISTANCE IN FIELD CIRCUIT. Check field circuit for loose connections, defective or wrong third brush, defective or loose field fuse clips, defective regulator or thermostat contacts permitting resistance unit to remain in field circuit.

DEFECTIVE COMMUTATOR. Examine commutator for dirty, oily or burnt surface or high mica as directed in section on "Commutators" under "Starter and Generator Internal Testing."

DEFECTIVE BRUSHES. Examine for excessive sparking and heat caused by poor contact, improper setting, wrong brushes or weak brush spring tension. Check brush mountings for shorts.

OPEN OR SHORTED ARMATURE COILS. Loose connections, thrown solder, open or shorted coils will cause low charging rate and excessive heat in the generator. Disassemble generator and examine carefully. Test armature as directed in section on "Armatures," under "Starter and Generator Internal Testing."

**High Generator
Voltage.
(Overcharges
Battery or Burns
Out Lights.)**

LOOSE CONNECTIONS. Check generating circuit for loose connections in third brush systems causing high voltage. Examine connections at relay, ammeter, switch and battery. If defective, clean connections and tighten.

GROUNDING THIRD BRUSH. Grounds in field circuit or third brush mounting arm may cause failure of regulating action and permit high generator voltage.

SHORTED RESISTANCE UNITS. Check regulator where used for sticking contacts or shorted resistance coil. Examine thermostat for bent arm.

MOTING TEST. Check generator by running as a motor on the bench. Connect generator to six volt battery through ammeter. Armature should revolve slowly and evenly in same direction as when driven on car. Check current consumption with table given on car data sheet in the REED SERVICE MANUAL. If generator performance is not satisfactory check by following table.

Current Flow Is Intermittant or Armature Rotates Unevenly. OPEN OR SHORTED ARMATURE COILS. Disassemble generator and test armature as directed in section on "Armature" under "Starter and Generator Internal Testing."

Armature Does Not Rotate. EXCESSIVE FRICTION. Test generator for tight bearings, bent shaft, or rubbing pole pieces.

WRONG BRUSH POSITION. Check brush mounting plate for correct position. Brushes are set at factory in

correct position and should not be moved except to correct unauthorized tampering. Disconnect field lead. Loosen holding screws and shift brush mounting plate until generator ceases to rotate in either direction. Then turn plate against direction of rotation slightly and tighten mounting screws.

If above tests indicate that the generator is defective, disassemble it and check as directed under "Starter and Generator Internal Testing" section.

MOTOR-GENERATORS

Motor-generators are built with a single winding on armature and operate as both motor and generator or have two windings on armature and field, making motor and generator electrically separate although built as one unit. Machines using single winding are permanently connected to engine crankshaft through gears or chain drive. Current regulation when operating as a generator is by reverse series field or third brush system. Check motor-generators of this type for motoring and generating troubles as listed separately in sections on "Starters" and "Generators."

If motor-generator has two armature windings as used in Delco machines and connection to engine is through overrunning clutch and pinion shifted by the motoring action of the generating unit, check for special troubles in following table. Check for general motor and generator troubles from tables given in sections on "Starters" and "Generators."

GENERATING CIRCUIT NOT BROKEN. Check generator switch incorporated in starting mechanism or motor brush lifting mechanism and make certain that generating line is broken when motor brushes are in contact with the commutator. Adjust switch blades or sand down generator brush in types where brush is lifted from commutator, until this result is obtained.

Motor-Generator Cranks Engine Slowly.

MOTOR OVERRUNNING CLUTCH SLIPPING. Motor-generator revolves without cranking engine, or cranks slowly. Disassemble clutch and examine. If gummed or sticking clean and repack with pure vaseline. If worn replace cam, rollers or plungers.

DEFECTIVE MOTOR. Examine motor carefully for defective commutator, brushes and shorted or grounded motor field and armature coils. Test as directed in section on "Starters."

GENERATOR LINES OPEN. Check line between generator armature and switch. With ignition switch turned on,

Generator Unit Does Not Motor and Mesh Starter Pinion.

Operates As Motor Before Pinion Gears Mesh.

Motor-Generator Does Not Generate or Charging Rate Below Normal.

disconnect lead at motor-generator and flash to ground. If no spark is visible generator line is open. Examine connections at switch and repair or replace line.

GENERATOR FIELD LINE OPEN. Check generator field connection to ignition coil or switch. Disconnect field lead at generator terminal and flash to ground. If no spark results, field lead is open. Examine connection at switch and replace line.

TIGHT BEARINGS. Check motor-generator for tight bearings, bent shaft, or striking pole pieces preventing armature from turning. Rotate armature by hand, noting force required.

DEFECTIVE MOTOR SWITCH. Check motor switch and shifting mechanism for broken connections, lost motion, or bent shifting lever. In system using brush lifting mechanism as switch check for long brushes touching commutator when switch is open. Repair by replacing brushes or sanding down to remedy condition.

GENERATOR OVERRUNNING CLUTCH SLIPPING. Examine generator overrunning clutch for slipping caused by wear or gumming of roller. Disassemble clutch and clean with gasoline, repacking with pure vaseline, or if worn replace cam, roller and plunger.

DEFECTIVE GENERATOR SWITCH. Check switch to make certain that generator circuit is completed after cranking operation has been finished. If switch sticks generator voltage will increase, causing damage to windings.

DEFECTIVE GENERATOR. Check generator for defective commutator or windings or shorted or open field coils and armature windings, as directed in section on "Generators."

STARTER

The starting circuit consists of the battery, starting switch, starting motor and the heavy cable used to connect these units. In normal operation when the starting button is pressed with the lights turned on the lights should dim slightly. Test starting circuit and starter by turning lighting switch to "Bright" position and noting lights when the starter switch is closed. Check with following table:

1. HEAD LIGHTS DO NOT DIM PERCEPTIBLY.

Starter Dead.

Check for broken starter cable, loose connections or defective starting switch, as directed in following section.

Check starter for internal open circuits in field, armature or brush connections.

Starter Engages With Flywheel. Check for loose connections and defective starting switch. Check starter for defective commutator or high mica or sticking brush arms. Check for open field or armature coils.

2. HEAD LAMPS DIM SLIGHTLY BUT STARTER DOES NOT OPERATE SATISFACTORILY.

Starter Dead. Check for jammed pinion. Release by placing car in gear and rocking back and forth. Check engine for heavy oil or tight bearings by cranking engine by hand. Examine flywheel for broken teeth.

Starter Revolves but Does Not Crank Engine. Check systems using overrunning clutch for worn or gummed rollers. Disassemble clutch, clean with gasoline and repack with vaseline or medium heavy grease.

Check Bendix drive for broken spring or spring bolt or dirty or gummed Bendix drive shaft. Disassemble and clean with gasoline.

Check manual gear shift for broken or disconnected starting pedal or play in shifting rod.

Check for loose connections at battery, starting switch, and starter terminal.

Check starting switch for burnt or defective contacts as follows:

Test with voltmeter placing test points connected to voltmeter on each starting switch terminal. Voltmeter reading will indicate full battery voltage with the switch open but should drop to 0 when the switch is closed. A reading with switch closed indicates defective or burnt switch contacts. Disassemble switch and clean contacts. Check for proper contact with switch arm.

Starter Cranks Engine Slowly.

Examine starter for defective commutator—oily, dirty, burnt or high mica, as directed in section on "Commutators" under "Starter and Generator Internal Testing."

Check for oily, soft or defective brushes or weak brush spring tension.

Check starter for shorted or reversed field coils as directed in section on "Starter and Generator Internal Testing."

3. LIGHTS DIM GREATLY OR GO OUT.

If lights dim greatly check for discharged battery, grounded field coils or shorted or grounded armature coils as directed in sections on "Battery" and "Starter and Generator Internal Testing."

Starter Dead.

If lights go out check for loose connections or open circuits at battery terminal, starter switch or starter terminal as directed in following paragraph.

Starter Cranks Engine Slowly.

Check for damp, grounded or shorted field or armature coils or grounded brushes as directed in section on "Starter

and Generator Internal Testing."

GENERAL TESTING OF STARTING UNITS

Check connections by connecting test points to voltmeter and placing one test point on either side of connection to be tested. In testing battery terminals place one test point on battery post and other on starter cable. Close starter switch. No reading should be indicated on the voltmeter. A reading indicates poor connections which should be cleaned and tightened.

Operate starter on bench to check performance with data given on particular car in REED SERVICE MANUAL. Mount starter rigidly on bench and connect to fully charged six volt battery with No. 00 stranded starting cable through a regular starting switch. Connect six volt voltmeter across starter terminals. Connect ammeter in circuit making certain that proper size shunt is used. (Current on lock torque tests may be 750 amperes). Run No Load, Lock torque and Load Tests to check starter.

Close starting switch allowing starter to revolve freely. Check current consumption and speed and compare with data given for particular starter on car data sheet in the REED SERVICE MANUAL. If starter is mounted on a test bench the speed can be accurately determined. Otherwise a tachometer or speed counter should be used. If the starter does not perform in accordance with test specifications, disassemble and examine. Tight bearings or worn bearings or bent shaft causing armature to rub pole pieces will cause higher current consumption and lower speed.

Fasten a brake arm of wood or metal rigidly to armature shaft so that armature can only revolve by turning brake. Make brake arm one foot in length from center of shaft to outer end and fasten a spring balance to end or rest on scale capable of reading equivalent of lock torque in pounds. (Starter lock torque 8-12 pound feet. With starters using reduction gears lock torque may be as high as 70 pound feet.) Close starter switch and note scale reading. Reading in pounds will give lock torque of starter in pound feet. Compare figure and ammeter and voltmeter readings with figures given on car data sheet in REED SERVICE MANUAL. If starter does not develop full lock torque examine for internal defects as directed in section on "Starter and Generator Internal Testing."

Fasten brake arm to armature shaft so that starter can revolve and friction between brake arm and armature shaft can be varied. Make bearing surface of brake arm in two pieces straddling shaft and held by bolts and thumb nuts. Vary pressure on shaft by tightening or loosening nuts. Close

For Defective Battery Terminals, or Connections.

For Defective Starter.

No Load Test.

Lock Torque Test.

Load Test.

starter switch and operate starter with various loads noting scale reading, current consumption and voltage. Compare figures obtained with table given on car data sheet in the REED SERVICE MANUAL. Starter should operate closely in accordance with these figures. If considerable variation is

noticed, disassemble starter and examine.

If bench test on starter indicates that starter is defective and examination does not locate trouble, the starter should be disassembled and the brushes, commutator, field coils and armature coils tested separately as directed in section on "Starter and Generator Internal Testing."

STARTER AND GENERATOR INTERNAL TESTING

FIELD COILS. Check as follows:—

Check field with compass. Connect field terminals to six volt battery, using resistance with starter fields. With small current flowing in field coils, hold a compass near frame opposite center of pole piece. Note which end of compass needle is attracted toward pole. Adjacent poles should attract opposite ends of compass needle, poles being alternately north and south around frame. If adjacent poles attract same end of compass needle, field coil connections are reversed or compass needle is demagnetized. Check compass for demagnetized needle by observing action when not near field poles. If field coil is reversed, interchange field connections or replace with correctly wound coil.

For Reversed Coils.

Disconnect all brush and ground connections in the field circuit. Make certain that field leads do not touch frame. Test field with lamp and test points, placing one point on field terminal and other on frame. The lamp should not light. If it does field is grounded. Disconnect leads between coils and test separately for grounded coil. Defective coil must be reinsulated or replaced.

For Grounded Coils.

Test with lamp and test points. Disconnect field connections or insulate third brush from commutator with slip of cardboard. Place one test point on lead at each end of field circuit. The lamp should light. If it does not field circuit is open. Check connections between coils and test each coil with lamp and test points to locate defective coil. Repair if caused by open connection or replace coil if defective.

For Open Circuited Field.

Check each generator coil separately by connecting across six volt battery with ammeter in circuit. Check ammeter reading and compare with current drawn by other coils. Coils should draw approximately same current. Coil drawing considerable excess is shorted and must be repaired or replaced.

For Short Circuits.

Starter coils are of low resistance and cannot be tested in this way. Examine starter coils for melted insulation or burnt winding caused by short circuit.

Check for shorts between motor and generator field windings with lamp and test points. Place one test point on motor

Motor-Generator Tests.

For Shorted Fields.

field terminal and other on generator terminal. The lamp should not light. If it does windings are shorted. This will cause low cranking speed and excessive current consumption. Examine windings and repair shorts.

ARMATURES.

Examine armature carefully for thrown coils, thrown solder, or loose connections. Examine for damage caused by bent shaft or loose pole pieces resulting in armature striking pole piece. If armature heats excessively check relay for sticking contacts and test armature for shorted coils.

Test armature as follows:

For Grounds.

Test with lamp and test points. Place one test point on commutator and other on armature shaft. The lamp should not light. If it does commutator bars or armature coils are grounded. Examine commutator and test armature coils for shorts probably causing the ground.

For Open Circuited Armature Coils.

BAR TO BAR TEST. Mount armature on bench. Connect in circuit with resistance and six volt battery through contacts or brushes resting on commutator at points diametrically opposite (180° apart) for two pole generators and at right angles (90° apart) for four pole machines. Adjust resistance so that approximately ten amperes flow through armature coils. Rotate generator slowly, taking readings between each two commutator bars with test points connected to three volt voltmeter. (Number commutator bars 1, 2, 3, 4, etc., and take readings between 1 and 2, 2 and 3, 3 and 4, etc.) These readings should approximately agree around armature. If one reading is appreciably higher than others, armature coil is open. Examine coil connection at commutator slot and repair or replace coil. In testing four pole machines, readings will increase in places diametrically opposite, due to jumpers used in making connections. The readings will then regularly decrease.

GROWLER TEST. Mount armature on growler connected to 110 volt A.C. line. The same growler can not be used to test both starter and generator armatures unless a special machine is employed having coil wound in two sections which may be connected in parallel or series, as desired, or some other method of securing different coil ratio necessary in

For Short Circuited Armature Coils.

testing both types of armatures is used. Slowly rotate armature on growler, keeping a thin strip of steel or hacksaw blade laid lengthwise on uppermost armature segment. If armature coils are shorted local currents are set up, causing steel strip to be attracted perceptibly to armature core. Short circuit is either in coil or commutator. Examine commutator for shorts caused by foreign matter in slots or shorted coil connections. Repair or replace defective coil.

VOLTMETER TEST. If growler test does not locate suspected shorts in armature coils repeat "Bar to Bar" test, using .3 volt scale of voltmeter. This test must not be made until all open circuits in armature coils have been eliminated. An open circuit will cause damage to voltmeter. Voltmeter readings will be approximately the same around armature. If reading drops to 0 armature coil is shorted and must be repaired. In taking readings care must be used to keep test points on adjacent commutator bars.

Motor-Generator Test.

On motor-generators using two armature windings test for short circuits between windings with lamp and test points. Place one test point on motor commutator and other on generator commutator. The lamp should not light. If lamp lights, windings are shorted. Test each winding and replace armature if the short cannot be located and repaired.

COMMUTATORS.

Commutator is checked for shorts and grounds in testing armature coils. Commutator should be dark brown, clean and smooth. If oily, clean with gasoline, wiping dry before operating machine. If commutator is rough, smooth with No. 00 sandpaper. Do not use emery cloth. If badly burnt or with high mica turn down commutator and undercut mica on generator commutators. Starter commutators are not undercut. Hard brushes are used which keep mica worn away.

Turning Down Commutator.

Turn down commutator in a lathe. Run lathe at high speed and take a fine cut. Do not use dull cutting tool or mica insulation will be injured or copper will be turned over between bars, shorting coils.

Undercutting Commutators.

Cut out mica between bars on generator commutators to a depth of 1/32 in. Use a special undercutting tool or a hacksaw blade ground to fit between the bars. The mica must be cut evenly across so that a rectangular slot is left between the commutator bars. After cutting mica bevel the edge of the commutator bars with a flat file to remove all burrs.

BRUSHES.

Examine brushes for correct performance. If defective, brushes will affect charging rate or cause excessive sparking, resulting in burnt commutator or overheated commutator or armature coils.

Check brushes for following troubles:

Brushes Spark or Overheat in Service.

IMPROPER MOUNTING. Brushes should make snug fit in holders, but should be free to move. Test for binding or for sticking brush arms on systems using rigid mounting with swinging brush arm.

LOOSE CONNECTIONS. Check brushes mounted in box type holders for positive connection of braided "pigtail" to brush and holder. If broken, current flows through sliding contact between brush and holder, cutting down output through high resistance of connection.

WRONG BRUSHES. Brushes recommended by manufacturer should be used for particular machine. Improper brushes may affect charging rate and cause damage to commutator. If third brush is not of proper resistance field current will not be correct, causing unsatisfactory generator performance.

BRUSHES NOT PROPERLY SEATED. Check brushes for proper bearing surface on commutator. Brushes must bear on commutator across entire face. Sand brushes in by slipping strip of sandpaper wider than brush between brush and commutator, wrapping sandpaper around commutator so that brush face will have correct curvature. If all brushes need sanding in glue strip of sandpaper to face of commutator and rotate armature. Blow out all carbon dust before operating machine.

IMPROPER SPRING TENSION. Check position of brush spring. It should bear straight down on brush. Test spring tension by lifting spring from brush with small spring balance. Note reading when spring leaves brush. If brush is rigidly mounted to brush arm note brush arm spring tension in same way. Set spring tension to figure recommended for particular brushes and machine. If spring tension is too light brushes will spark, resulting in burnt commutator. If spring tension is too heavy brushes will wear rapidly, cutting commutator and overheating in service.

GROUNDING BRUSH ARMS OR HOLDERS. Check insulated brush holders or arms for shorts to ground. Disconnect all leads from brush holder and insulate brush from commutator with slip of cardboard. Then test with lamp and test points, placing one test point on brush holder and other on frame. The lamp should not light. If it does, the brush holder or arm is grounded and must be repaired.

SHAFT BENT OR COMMUTATOR NOT ROUND. Check commutator to see if out-of-round. Check armature shaft for wear, allowing wobbling while rotating. If commutator is not round brushes will be thrown off at high speeds, causing fluctuations in charging current. Repair by truing commutator in lathe.

Packard

Series 1, 2 and 3 (1916-17-18)

Bijur Generating, Starting and Lighting System Delco Ignition

Battery.—Battery is 6 volt, 120 ampere-hour. The positive (+) terminal is grounded.

Ignition.—Breaker contacts should separate .015 inch to .020 inch. The right and left hand contacts should open alternately. To clean contacts, put a drop of oil in each pair of contacts, engine in operation. Run the engine until the violent sparking caused by the oil ceases. Then clean them thoroughly with gasoline.

Timing.—Breaker contacts begin to separate when piston No. 1R entering power stroke, marking "Top dead center cyl. No. 1" on the flywheel, (for Series 1.) or "O" (for Series 2.) is $\frac{7}{8}$ inch top dead center or indicator line on flywheel housing, spark control lever and breaker assembly fully retarded. For Series 3. Right breaker begins to separate when piston No. 1R is on compression stroke, marking "SR" on flywheel is at top dead center or even to indicator line on flywheel housing. Left breaker begins to separate when piston No. 1L on compression stroke, marking "SL" is at top dead center or even to indicator line on flywheel housing. The spark control lever and breaker assembly must be fully advanced.

Firing Order.—The firing order is 1R, 6L, 4R, 3L, 2R, 5L, 6R, 1L, 3R, 4L, 5R, 2L.

Spark Plug Gaps.—Spark plug gaps should be .031 inch.

Oiling.—Put 8-10 drops of light engine oil in each of the ignition unit oilers every month. If car is driven more than 1000 miles in a month, the oiling must be done every 1000 miles. Once a season, remove the top and lower plates at the rear of distributor housing, and repack with vaseline.

Starter.—Starter is connected to engine through a set of reduction gears and pinion meshed by the operator on the Series 1 and 2 cars, and through a set of reduction gears and a Bendix drive on the Series 3 cars.

Oiling.—Fill starter oilers with light engine oil once a month.

Generator.—Generator voltage regulation is by vibrating regulator, mounted on top of generator. This regulator enables generator to supply electrical energy for lights and ignition when battery is disconnected, but car should not be driven over 20 miles per hour. There are three sockets on the top of generator into which the three split plugs of the regulator should be inserted. Every month the disconnecting plug on the regulator should be pushed in and turned around until it springs forward and locks again. This reverses the current across the contacts, tending to keep them true. The charging current will vary with the state of charge of battery. Maximum generator output should be reached at 1000-1400 R. P. M., of armature, or 20 miles per hour. Generator voltage should be 7.75-7.8 volts at this speed. Internal circuits of generator are shown on Page 3.

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.

Relay-Regulator.—Relay should close at 10 miles per hour and open at 7 miles per hour. Charging current should be 1 to 3 amperes at closing, and the discharge current 0 to 1 ampere at opening of relay. Relay and regulator may be adjusted through two holes provided for this purpose in the cover. On the old type regulators, this hole is provided with a brass plug. The newer type regulators have brass plugs covered with a lead seal. Latest types have holes covered with lead seal, plug being omitted. Seal is to prevent incompetent parties tampering with the adjustment. In order to make adjustments, it is necessary to remove the lead seals and take out the brass plugs with a special spanner wrench. Then adjust regulator by a small socket wrench inserted in the left hole. The right hole is for adjusting relay. Turning the nut to the right (facing hole) will raise the cut-in voltage. Turning it to the left will decrease cut-in voltage. Generator voltage should be about 6.5 volts when relay closes.

Lamps.—Head lamps are 7 volt, 24 cp. Dimmer lamps are 7 volt, 6 cp. Dash, trouble, side, tonneau and quarter lamps are 7 volt, 4 cp. Dome lamp is 7 volt, 12 cp., gas filled. Tail lamp is 7 volt, 2 cp.

Dodge

(1917-18)

North East Generating, Starting and Lighting System Delco or Dodge-North East Ignition

Battery.—Willard, Type, SJW-26, 12 volt, 51.4 ampere-hour. The negative (—) terminal is grounded.

Ignition.—Delco Model No. 5151, or Dodge-North East Model O. Delco breaker contacts separate .018 inch. Dodge-North East breaker contacts separate .020 inch. They are made of tungsten. When the condition of the points affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

Oiling.—Delco. Remove the ignition coil mounting plate every six months and repack distributor driving gear housing with soft cup grease.

Oiling.—Dodge-North East. Refill the grease cup above the horizontal shaft and turn down one turn every month. If the car is driven more than 1000 miles in a month, this must be done every 1000 miles.

Timing.—Breaker contacts begin to separate when the exhaust valve in cylinder No. 4 just closes, spark control lever and breaker assembly in the fully retarded position. This is the firing position for No. 1 cylinder.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plug Gaps.—Spark plug gaps are .030 inch.

Starter-Generator.—Model G. Starter and generator are combined into one unit. The unit is chain-connected to the engine crank shaft. Adjust chain so as to permit 1/2 inch up and down play midway between the two sprockets.

STARTER DATA

Torque	R. P. M.	Amperes	Volts
4 lb. ft.	480	40	11.2
8 lb. ft.	365	65	10.6
12 lb. ft.	280	85	10.5
16 lb. ft.	200	110	10.0
20 lb. ft.	120	145	9.5
31 lb. ft.	Lock	180	8.75

Generator.—Generator current regulation is by reverse series field and third brush system. Rotation is counter-clockwise, viewed from commutator end.

GENERATOR DATA, COLD TEST

Amperes	R. P. M.	Miles per Hour
0	900	8.5
3	1000	9.5
5	1200	11.0
7	1800	17.0
6.5	2400	22.0
5	3600	34.0

Charging rate is varied by adjusting the third brush setting. Position of third brush is adjustable by a rack and pinion movement, operated by turning a screw, exposed in commutator end plate. The adjusting screw is the upper one. It is necessary to first loosen the lower screw one or two turns, in order to unlock the third brush plate. Turn the upper screw in a clockwise direction (looking at commutator end) to increase the charging rate and in a counter-clockwise direction to decrease the charging rate. Tighten the lower screw after making the adjustment. Maximum current output must not exceed 10 amperes.

Oiling.—Put 4 or 5 drops of light engine oil in rear bearing oiler of starter-generator every month. If car is driven more than 1000 miles in a month, the oiling must be done every 1000 miles.

Relay.—Relay is mounted with the starting switch. Relay closes at 10 miles per hour, or 1050 R. P. M. of armature, and opens at 8 1/2 miles per hour, or 900 R. P. M. of armature. Relay contacts separate .030 inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sand paper. Remove all grit. Adjust before again putting into service.

Lamps.—Head lamps are 12-14 volt, 15 cp. Dash and tail lamps are each 12-16 volt, 2 cp. All lamps have single contact base.

Fuse.—Field fuse, mounted on generator frame, is 10 ampere.

Dodge-North-East or Delco Ignition.

Plate No. 4

Plate No. 5

Kissel Kar

Hundred Point Six (1917-18)

Remy Generating and Lighting System. Remy Ignition
Remy or Kissel Starter

Battery.—Battery is 6 volt, 80 ampere-hour. The positive (+) terminal is grounded.

Ignition.—Breaker contacts should open .020 inch to .025 inch. Should they become badly burned or pitted, affecting the ignition, resurface them with a fine, flat jeweler's file or a piece of well worn No. 00 sand paper.

Timing.—Breaker contacts should just begin to separate when the flywheel marking "1-6 TC" is turned $1\frac{1}{4}$ inch past the indicator, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—Spark plug gaps should be .025 inch. If engine misses when running idle or pulling light, gap should be made wider. If engine misses when running at high speed, the gap should be made narrower. Of course, this is providing there is no other defect causing the trouble, such as lack of compression, leaky valves, carburetor adjustment, etc.

Oiling.—Fill the grease cup under the distributor head with medium cup grease and turn down two turns every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Starter.—Starter is connected to the engine through a Bendix drive.

Oiling.—Put 4 or 5 drops of light engine oil in starter oilers every 500 miles.

Generator.—Generator current regulation is by vibrating regulator,
GENERATOR DATA, MODEL 245-B

Amperes	R. P. M.	Volts
0	600-650	6.0
7	700-750	6.5
13-14	1500	6.9
13-14	3000	6.9

Above tests are made without ignition. Running free as a motor, generator should draw 6 to 6.5 amperes at 5.8 volts, and turn at 740 R. P. M. Shunt field should draw 3.5 to 4 amperes at 5.9 volts.

Oiling.—Put 4 or 5 drops of light engine oil in generator bearing oilers every two weeks. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.

Relay-Regulator.—Type 60-A relay-regulator is used. The air gap between relay armature (moving member) and coil core should be .012 inch to .015 inch, contacts closed. Contacts should separate .012 inch to .015 inch. Clean relay and regulator contacts by drawing a piece of unglazed paper between them. If badly burned or pitted, resurface with a strip of well worn No. 00 sand paper, drawing a piece of unglazed paper between them to remove all grit, and adjust before again putting into service. Increasing spring tension on regulator armature will increase the output. Decreasing the spring tension will decrease the output.

Lamps.—Head lamps are 6-8 volt, 20 cp. Tail lamp is 6-8 volt, 2 cp. Dash lamp is 6-8 volt, 2 cp.

Fuses.—Generator fuse on relay-regulator base is 15 ampere, commercial fuse wire. Lighting circuit fuses are 20 ampere.

Plate No. 6

Dodge

1915-1916

North East Starting and Lighting System Eisemann Magneto or Delco Ignition

Battery.—Battery is 12 volt, 45 ampere-hour. The negative (—) terminal is grounded.

Ignition.—Magneto breaker contacts should open .015 inch to .020 inch. If badly burned or pitted, affecting the ignition, resurface them with a very fine, flat jeweler's file or a strip of worn No. 00 sand paper. Delco battery breaker contacts should open .010 inch to .012 inch on the 1915 cars having the steel bumper on contact arm. The clearance between the stop on the spring and the contact blade should be .015 inch. Should contacts become badly burned or pitted, resurface them with a fine, flat jeweler's file or well-worn No. 00 sandpaper. On 1916 cars, equipped with a fiber bumper on the contact arm, breaker contacts separate .020 inch.

Timing.—Breaker contacts should just begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

Spark Plug Gaps.—Spark plug gaps should be .016 inch on cars equipped with Eisemann magneto ignition and .030 inch on cars equipped with Delco battery ignition.

Firing Order.—The firing order is 1, 3, 4, 2.

Oiling.—Put in 3 or 4 drops of light machine oil in each of the magneto oilers every month. At the same time put a very small trace of vaseline on the fiber bumper of contact arm, applying with a toothpick. If car is driven more than 1000 miles in a month, these attentions must be given every 1000 miles. Put several drops of light engine oil in Delco ignition breaker bearings every two weeks. If a fiber bumper is provided on the contact arm, put a very small amount of vaseline on the cam, applying with a toothpick. If car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

Starter-Generator.—Starter and generator are combined into one unit. Starter should deliver 35 pound feet lock torque when taking 210 amperes. Cold engine, heavy oil, tight bearings or other mechanical obstructions, or damp, grounded or short circuited motor windings or commutator bars will cause low speed and excessive current during the cranking operation.

Generator.—Generator current regulation is by vibrating regulator. Normal maximum output should be 6.5 amperes.

Relay-Regulator.—Relay is combined with the regulator. Relay should close at about 1 mile per hour, or 1000 R. P. M. of armature. Charging current should be 3 amperes at closing and discharge current 0 to 1 ampere at opening of relay contacts. Air gap between relay armature (moving member) and coil core should be .030 inch. Air gap between regulator armature and coil core should be .025 inch. Clean relay and regulator contacts by drawing a piece of unglazed paper between them. If badly burned or pitted, resurface them with a piece of well worn No. 00 sand paper, drawing a piece of unglazed paper between them to remove all grit and adjust before again putting into service.

LAMPS.—Head lamps are 12-16 volt, 16 cp. Dash lamp is 12-16 volt, 3 cp. Tail lamp is 12-16 volt, 3 cp. All lamps are single contact.

Stearns-Knight Series 30,31,32 (1916-17-18).

Westinghouse Generating, Starting and Lighting System, Remy Ignition.

Plate No. 7

STEARNS-KNIGHT

MODELS SKL-4 AND SK-8, SERIES 30, 31 AND 32 (1916-17-18)
WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM
REMY IGNITION

BATTERY.—Willard, SJW-27, 12 volt, 65-80 ampere-hour. Starting capacity is 75 amperes for 20 minutes. Lighting capacity is 5 amperes for 14 hours. The positive (+) terminal is grounded. A 6 volt tap supplies current for ignition.

IGNITION.—SKL-4: Coil Model 175. Distributor Model 207. SK-8: Coil Model 176, Distributor Model 203. Breaker contacts separate .020 to .025 inch. They are made of tungsten. The contact surface of the points should be flat and smooth. When the condition of the points affects the ignition resurface them with a fine, flat jeweler's file.

Oiling.—Refill the cup under the distributor head with medium soft cup grease and turn down 2 or 3 turns every two weeks. If the grease cup is fitted with a wick, use pure vaseline instead of cup grease. Put a small amount of vaseline on the fiber bumper of the contact arm, applying with a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

Timing.—Breaker contacts begin to separate when the top dead center mark on the flywheel is 1½ inches past the indicator, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order of the SKL-4 is 1, 2, 4, 3. The firing order of the SK-8 is 1R, 4L, 3R, 2L, 4R, 1L, 2R, 3L.

Spark Plug Gaps.—Spark plug diameters are 7/8 inch. Gaps are .025 to .030 inch.

STARTER.—SKL-4: Frame No. 755, Style No. 234536. SK-8: Frame No. 755, Style No. 234537. Starter is connected to the engine through a Bendix drive. Starter cranks the engine at 1850 R.P.M., taking 154 amperes at 10.5 amperes.

Starter Data.

Torque	Amperes	Volts	R.P.M.
0.0 lb. ft.	50-70	5.5	3000-4500
3.5 lb. ft.	154	10.5	1850
20 lb. ft.	500	5.5	Lock

When the motor is running free, the maximum voltage should never be more than 6 volts. The brush pressure should be from 2 to 3 lbs. Keep the commutator clean and free from dirt, wiping it off occasionally with a clean, smooth cloth.

Oiling.—Put 4 or 5 drops of light engine oil in each starter oiler every 1000 miles or each month.

GENERATOR.—Frame No. 208, Style No. 231799. Generator current regulation is by reverse series field. The current for the lights does not pass through the reverse series field, so when the lights are turned on the generator output is automatically increased, keeping the charging rate practically constant. No means of increasing the generator output is provided. However, for winter driving terminals B and L may be shorted by means of a jumper (or switch when provided). The generator must not be operated in this condition at any other time or when driving at a high rate of speed. Maximum charging rate of generator is 8-10 amperes, reached at 25 miles per hour.

Generator Data

Cold Test			Hot Test		
Amperes	R.P.M.	Volts	Amperes	R.P.M.	Volts
0	410	12.5			
4	600	12.5	7-8	1500	12.5-13.5
8-9	1500	12.5-13.5			

Oiling.—Put 4 or 5 drops of light engine oil in each generator oiler every two weeks or each 500 miles.

RELAY.—The relay is mounted on the rear bracket of the generator. The relay closes at 8-10 M.P.H. or 14-14.3 volts and opens at 7-9 M.P.H. or a discharge current of 0-1.5 amperes. The relay contacts separate .012-.016 inch. Clean the relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 12-16 volts, 16-30 cp. Dimmer lamps are 12-16 volts, 6 cp. Dash and tail lamps are 12-16 volts, 3 cp.

FUSES.—Fuses are 20 amperes.

Plate No. 8

Davis

Model 6-J (1918)

Delco Generating, Starting and Lighting System

Delco Ignition

Battery.—Battery is 6 volt, 100 ampere-hour. The negative (—) terminal is grounded.

Ignition.—Coil, Model No. 2159. Distributor, No. 5157. Breaker contacts begin to separate when the top dead center mark on the flywheel is $1\frac{3}{4}$ inches past the indicator, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—Spark plug gaps are .027 inch to .030 inch.

Oiling.—Put 3 or 4 drops of light engine oil in timer bearing every two weeks. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.

Starter.—Model No. 136. Starter is connected to engine through a Bendix drive. When operating freely, starter current is 35 amperes, armature revolving at 4500 R. P. M.

Generator.—Model No. 135. Generator current regulation is by third brush system. Generator begins to supply current at 8-10 miles per hour, or 500-550 R. P. M., of armature. Maximum charging rate of 16-18 amperes is reached at 20-25 miles per hour.

GENERATOR DATA, MODEL 135

Amperes	R. P. M.	Amperes	R. P. M.
Neutral	500	Neutral	500
10-12	900	10.5-12.5	900
14-16	1400	15.5-18	1400
11-13	2000	13.0-17	2000

Oiling.—Put 5 or 6 drops of light engine oil in each of generator oilers every two weeks. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.

Relay.—There is no relay. The circuit between generator and battery is controlled by the ignition switch. The overrunning clutch at driving end allows generator to operate as a motor when battery's pressure is above that of generator. The noise made by the clutch serves to attract the operator's attention to open the ignition switch. The opening and closing of the generator-battery circuit by the operator takes the place of the relay.

Lamps.—Head lamps are 6-8 volt, 15 cp. Dash lamp is 6-8 volt, 4 cp. Tail lamp is 6-8 volt, 4 cp.

Circuit-Breaker.—A vibrating type circuit breaker takes the place of fuses. It takes 25 amperes to start this device vibrating, but when vibrating, 3 to 5 amperes will cause it to continue.

Internal circuits shown on Page 10.
Plate No. 9

Winton

Model 21 (1915)

Bijur Generating, Starting and Lighting System Bosch Ignition

Battery.—Battery is 6 volt, 120 ampere-hour. The positive (+) terminal is grounded at the starting motor.

Ignition.—Breaker contacts separate .014 to .016 inch. When the condition of the points affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sand paper.

Oiling.—Put several drops of light engine oil in each of magneto oilers every month. If car is driven more than 1000 miles in a month, the oiling must be done every 1000 miles.

Timing.—Breaker contacts begin to separate when piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—Spark plug gaps are .020 to .025 inch.

Starter.—Type A42-M66. Rotation is anti-clockwise, looking at commutator end. Starter is connected to the engine through a set of reduction gears meshed by the operator.

Oiling.—Put 5 or 6 drops of light engine oil in each of starter bearing oilers every month. At the same time put a small amount of thin grease on the starting switch shaft.

Generator.—Type K638-M62. Generator voltage regulation is by vibrator regulator. Rotation is anti-clockwise, looking at commutator end. Maximum charging rate is 15 to 18 amperes, decreasing to 4 to 6 amperes when battery becomes fully charged. To tighten generator drive belt, loosen the bolts holding generator to frame and adjust tension screws until belt is tight, after which the bolts must again be tightened.

Oiling.—Put 4 or 5 drops of light engine oil in each of generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Relay-Regulator.—Relay closes at 12 miles per hour and opens at 10 miles per hour. Adjust spring tension so that relay closes when voltmeter connected across generator brushes indicates 6.5 volts. To adjust regulator, drive the generator at 1000-1400 R. P. M., charging a battery of 1250 specific gravity, and adjust the spring tension on regulator armature (moving member) until a voltmeter connected across the brushes of the generator indicates 7.85 volts. This voltage should be maintained at all speeds above the cut-in speed. Clean relay and regulator contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sand paper. Remove all grit. Adjust before again putting into service. Every two weeks or 500 miles of travel reverse the regulator disconnecting plug by pushing it in, turning through 180° until it springs forward and locks on the opposite side of the disconnecting position. Circuits of the relay-regulator are shown on Page 8-A.

Lamps.—Head lamps are 6-8 volt, 17 cp. Dimmer lamps are 6-8 volt, 5 cp. Dash and tail lamps are 6-8 volt, 2 cp.

Fuses.—Fuses are 10 ampere.

1916-1917 (SERIAL NOS. 1 TO 14004)

BLJUR GENERATING, STARTING AND LIGHTING SYSTEM

BOSCH IGNITION

BATTERY.—Battery is 6 volt, 80 ampere-hour. The two-wire system is used on cars No. 1 to 13,125, inclusive. The negative (—) terminal is grounded at the starting switch on all cars after No. 13126.

IGNITION.—D U-6. Breaker contacts separate .014 to .016 inch. When the condition of the points affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Put 3 or 4 drops of light machine oil in each of magneto oilers every month. Put a small amount of vaseline on the fiber bumper of the contact arm, applying with a toothpick. If car is driven more than 1000 miles in a month, these attentions must be given every 1000 miles.

TIMING.—Breaker contacts begin to separate when piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .018 to .022 inch.

STARTER.—Starter is connected to the engine through a pinion shifted by the operator on the 1916, Model 25, cars with Rutenber engine, and through a Bendix drive on all other models.

OILING.—Put 4 or 5 drops of light engine oil in each of the starter oilers every month. On cars using manual shift, lubricate the sliding surfaces at the same time.

GENERATOR.—Type L-61. Generator current regulation is by third brush system. Maximum generator output is 12-16 amperes, reached at 20-25 miles per hour, or 1400-1600 R.P.M. of armature. Output is varied by shifting third brush. Third brush is secured to generator by two stud bolts, the nuts of which appear in a recess in the front head of generator. Loosen these nuts with a socket wrench and shift the brush by gently tapping the shank of the wrench. Shifting brush in the direction of armature rotation will increase the output. Shifting brush in the opposite direction will decrease the output. Shifting the brush 1/16 inch will vary the output 2 or 3 amperes. Tighten nuts after adjusting brush. Brush adjustment is made to give the desired rate with generator hot and carrying a 3 cell battery with solution of 1.250 or higher. There is a 20 ampere fuse in the small aluminum cap on generator housing to protect generator windings, should excessively high resistance occur in the charging circuit.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.

RELAY.—Relay closes at 10-12 miles per hour, or 500-600 R.P.M. of armature, and opens at 8-10 miles per hour, or 450-500 R.P.M. of armature. The charging current is 1 to 3 amperes at closing, and the discharge current 0 to 1 ampere at opening of relay. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 15 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash lamp is 6-8 volt, 2 cp. Tail lamp is 6-8 volt, 2 cp.

SCRIPPS — BOOTH

Model C (1915-16) SERIAL NOS. 1 UP.

Bijur Single Unit Generating, Starting and Lighting System Remy Ignition

Battery.—Battery is 12 volt, 35 ampere-hour. The positive (+) terminal is grounded.

Ignition.—Breaker contacts separate .020 to .025 inch. When the condition of the points affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sand paper.

Oiling.—Refill the cup under the distributor head with soft cup grease and turn down two turns every two weeks. Put a small amount of vaseline on the fiber bumper of the contact arm, using a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

Timing.—Breaker contacts begin to separate when piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plug Gaps.—The spark plug gaps are .025 to .030 inch.

Starter-Generator.—Model MG-1213. Starter and generator are combined into one unit. Armature is permanently chain connected to engine crank shaft. Running freely starter current is 30-40 amperes at 12 volts, armature revolving at 500-700 R. P. M. The torque is 2.3 pound-feet at 430-480 R. P. M., current 100 amperes at 11.7 volts

Generator.—Generator current regulation is by third brush system. Generator begins to supply current at 10 miles per hour, or 720-750 R. P. M. of armature. Maximum generator current output of 7-9 amperes is reached at 20-25 miles per hour, or 1600-1800 R.P.M. On cars from 1-1100, generator is connected directly to battery. The cars must not be operated, in coasting, with the ignition switch off, as the excessive voltage will cause damage to the generator and lights. On cars from 1100 up, the shunt field is connected to the switch and since opening the ignition circuit, opens the shunt field as well no damage can be done to the field winding.

Oiling.—Put several drops of light engine oil in each of starter-generator oilers every two weeks. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.

Lamps.—Head lamps are 12-16 volt, 15 cp. Dimmer lamps are 12-16 volt, 4 cp. Dash lamp is 12-16 volt, 2 cp. Tail lamp is 12-16 volt, 2 cp.

BATTERY.—Battery is 6 volt, 80 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Magnetto breaker contacts separate .018 to .020 inch. When the condition of the points affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Fill magnetto bearing oilers with light machine oil every month. If car is driven more than 1000 miles in a month, oiling must be done every 1000 miles.

TIMING.—Breaker contacts begin to separate when mark "1-6 DC" on flywheel is $\frac{1}{2}$ inch past indicator, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .020 to .025 inch.

STARTER.—Type F-65, M664 or, M460A, clockwise rotation, commutator end. Starter is connected to engine through a Bendix drive.

OILING.—Put several drops of light engine oil in each of starter bearing oilers every month.

GENERATOR.—Type L61, M399, M467, M677 or M767. Rotation is anti-clockwise, commutator end. Generator current regulation is by third brush system. Maximum generator output is 12-16 amperes, reached at 20-25 miles per hour or 1400-1600 R.P.M. of armature. Output is varied by shifting third brush. Third brush is secured to generator by two stud bolts, the nuts of which appear in a recess in the front head of generator. Loosen these nuts with a socket wrench and shift the brush by gently tapping the shank of the wrench. Shifting brush in the direction of armature rotation will increase the output. Shifting brush in the opposite direction will decrease the output. Shifting the brush $\frac{1}{16}$ inch will vary the output 2 or 3 amperes. Tighten nuts after adjusting brush. Brush adjustment is made to give the desired rate with generator hot and charging a 3 cell battery, battery reading 1.250 or above. There is a 20 ampere fuse in the small aluminum cap on generator housing to protect generator windings, should excessively high resistance occur in the charging circuit.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.

RELAY.—Relay closes at 10-12 miles per hour or 500-600 R.P.M. of armature, and opens at 8-10 miles per hour, or 450-500 R.P.M. of armature. The charging current is 1 to 3 amperes at closing, and the discharge current 0 to 1 ampere at opening of relay.

LAMPS.—Head lamps are 6-8 volt, 18 cp. Side lamps are 6-8 volt, 4 cp. Dash lamp is 6-8 volt, 2 cp. Tail lamp is 6-8 volt, 2 cp.

FUSES.—Fuses are 15 ampere.

CONNECTICUT IGNITION

BATTERY.—Battery is 6 volt, 80 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Breaker contacts separate .023 inch. They are made of tungsten. When the condition of the points affects the ignition, renew the inner breaker mechanism. For temporary service, resurface contacts with fine emery cloth.

OILING.—Refill the cup under breaker head with pure vaseline and turn down every month. If car is driven more than 1000 miles in a month, this must be done every 1000 miles. Do not put grease or oil in the cup.

TIMING.—Breaker contacts begin to separate when mark "1-4 DC" on flywheel is 1 inch past indicator, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 3, 4, 2.

SPARK PLUG GAPS.—Spark plug gaps are .025 inch.

STARTER.—Frame No. 318. Style 239,409 (1916) or 248,542 (1917). Starter is connected to engine through a Bendix drive. Torque at 1500 R.P.M. is 2 pound-feet. Lock torque is 11.5 pound-feet, current being 400 amperes.

OILING.—Refill starter oil wells with light engine oil every three months.

GENERATOR.—Frame No. 400-R. Style Nos. 225,722 or 239,408 or 245,401. Style No. 245,401 supersedes Style No. 225,772. Generator voltage regulation is by a vibrating regulator. Maximum charging rate is 15-18 amperes, decreasing to 4-6 amperes when battery becomes fully charged.

Generator Data

Battery Charge Current No Lamp Load			Battery Charge Current 7 Ampere Lamp Load		
Volts	Amperes	M.P.H.	Volts	Amperes	M.P.H.
6.5	8	10	6.3	0	12
6.6	8	15	6.5	4	15
7.0	12	20	6.6	6	20
7.0	12	25	6.7	7	25
			6.7	7	30

Above tests are with battery solution of 1.250. The difference in voltage at 1200 R.P.M., no load, and at 1200 R.P.M., 15 ampere load, must not exceed 1.0 volt and must not be less than .7 volt. A greater variation is due to improper or clogged regulator air gaps.

OILING.—Put several drops of light engine oil in each of generator oilers every two weeks. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.

RELAY-REGULATOR.—Relay and regulator are combined into one unit. Relay closes at 7-10 miles per hour or 575 R.P.M. of armature, and opens at 5-7 miles per hour or 525 R.P.M. of armature. Charging current is 1-3 amperes at closing and the discharge current 0-1 ampere at opening of relay. Regulator is set to limit voltage to 6.6 volts at 15 ampere load or 7.0-7.5 volts at no load, armature revolving at 1200 R.P.M. Clean relay and regulator contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 15 cp. Dash lamp is 6-8 volt, 2 cp. Tail lamp is 6-8 volt, 4 cp.

FUSES.—Fuses are 10 ampere.

Plate No. 16

SERVICE ENGINEERING COMPANY, SAN FRANCISCO—COPYRIGHTED, 1926

PEERLESS

Model 56, 56F (1916-17)

Auto-Lite Generating, Starting and Lighting System Atwater Kent Ignition

Battery.—Battery is 6 volt, 125 ampere-hour. The negative (—) terminal is grounded. There is a set of 6 dry cells so connected that they may be switched into the ignition circuit should other sources fail.

Ignition.—Contacts should separate .010 to .012 inch. They are made of tungsten, and will operate properly even though rough, due to the fact that the surfaces fit each other perfectly. Their natural color is dark gray, not silver. If burned or corroded, affecting the ignition, remove them and clean by drawing across a piece of fine emery cloth laid on a flat surface, as on the bed of a drill press, finishing on a very hard oil stone.

Timing.—Spark should occur when the piston entering power stroke is on top dead center spark control lever midway between the fully advance and fully retarded position. (First see that breaker assembly is fully retarded when lever is in the fully retarded position.)

Firing Order.—The firing order is 1R, 4L, 3R, 2L, 4R, 1L, 2R, 3L.

Spark Plug Gaps.—Spark plug gaps should be .025 to .031 inch.

Oiling.—Put a drop of light machine oil on each of the wearing surfaces of breaker and put 4 or 5 drops of light machine oil in the oil hole beside the notched shaft, every two weeks. Put a very small amount of vaseline on the notched shaft, applying with a toothpick, at the same time. If car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

Starter.—Starter is connected to engine through a Bendix drive.

Oiling.—Starter bearings are packed with soft cup or ball bearing grease. Thoroughly clean out and repack bearing with grease every six months.

Generator.—Generator current regulation is by third brush system.

GENERATOR DATA, SPECIAL MODEL GH

Amperes	R. P. M.
5	770-855
10	1075-1210
12	1285-1575
12-13	1575-1625

Brush pressure on commutator should be 1 to 1 1/4 pounds.

Oiling.—Generator bearings are packed with soft cup or ball bearing grease, but should receive 2 or 3 drops of light engine oil every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Relay.—Relay should close at 8 miles per hour, or 570-600 R. P. M. of armature. Charging current should be .5 to 1.5 amperes at closing, and the discharge current 0 to 1 ampere at opening of relay contacts. Clean relay contacts by drawing a piece of unglazed paper between them. If badly burned or pitted, resurface with a strip of well worn No. 00 sand paper, and then draw a piece of unglazed paper between them to remove all grit. Adjust before again putting into service.

Lamps.—Head lamps are 6-8 volt, 15 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash lamp is 6-8 volt, 2 cp. Tail lamp is 6-8 volt, 2 cp.

Fuses.—Lighting fuses are 10 ampere.

Model Numbers.—Atwater Kent breaker is Type K-2, 8 cylinder. Standard coupling. Generator is Model GH, special type for Peerless car. Starter is Model MD (4 pole), or Model M (2 pole).

Plate No. 17

NATIONAL SIX CYLINDER

SERIES AF (1917) (SERIAL NOS. 20,000 TO 24,999) WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM DIXIE MAGNETO IGNITION

BATTERY.—Battery is 6 volt, 110 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Breaker contacts separate .018 to .020 inch. When the condition of the points affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

TIMING.—Breaker contacts begin to separate when the top dead center mark on flywheel is $1\frac{1}{4}$ inches before the indicator, spark control lever and breaker assembly in the fully advanced position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .025 inch.

OILING.—Refill magneto oil wells with light engine oil every month. If car is driven more than 1000 miles in a month, oiling must be done every 1000 miles.

STARTER.—Frame No. 700. Starter is connected to engine through a Bendix drive. Torque is 2.5 lb. ft. at 1200 R.P.M. Lock torque is 12.5 lb. ft., current being 400 amperes.

OILING.—Refill starter oil wells with light engine oil every three months.

GENERATING.—Frame 208-R. Generator voltage regulation is by vibrating regulator. Maximum current output is 14-16 amperes, decreasing to 4-6 amperes as battery becomes fully charged.

OILING.—Put 4 or 5 drops of light engine oil in each of generator bearing oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY-REGULATOR.—Relay and regulator are mounted in generator frame. Relay closes at 8-10, and opens at 6-8 miles per hour. Relay contacts separate .005 to .010 inch. Clean relay and regulator contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 18 cp. Dimmer lamps are 6-8 v lt, 4 cp. Dash lamp is 6-8 volt, 2 cp. Tail lamp is 6-8 volt, 4 cp.

HUDSON SUPER-SIX MODEL (1917-18) DELCO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

Plate No. 18

BATTERY.—Exide, Type 3X-15-1, 6 volt, 100 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 2127. Distributor Model No. 5147. Breaker contacts separate .018 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

TIMING.—Breaker contacts begin to separate when the flywheel mark “A—” is at the indicator, spark control lever and breaker assembly in the fully advanced position. The mark “A—” is one-half inch before the top dead center mark “DC 1 & 6”.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—The spark plug gaps are .025 to .028 inch.

OILING.—Put several drops of light engine oil in distributor bearing oiler every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles. Thoroughly clean out and repack driving gear housing with soft cup grease every six months.

STARTER-GENERATOR.—Model 82. Starter and generator are combined into one unit. Starter is connected to engine through a set of reduction gears and a pinion shifted by the operator. Raising and lowering of the motor brushes serves as a starting switch.

GENERATOR.—Generator current regulation is by third brush system. Generator begins to supply current at 6-8 miles per hour, or 450-500 R.P.M. of armature.

Generator Data			
M.P.H.	Amperes	R.P.M.	Amperes
9	5	440	Neutral
12	10	880	8.0-11
18	16	1200	14.0-16
24	17	1400	14.0-16
30	15	2000	11.0-13
36	13	2500	8.5-10.5
42	11		

Machines should be tested hot. Output may be varied by adjusting third brush. Moving third brush in the direction of armature rotation will increase the output. Moving it in the opposite direction will decrease the output.

Oiling.—Put 6-8 drops of light engine oil in rear generator oiler every two weeks. Put oil in the front oiler until it begins to flow out the drain provided. All gears and sliding surfaces of the starter transmission must be kept well oiled.

Relay.—There is no relay. The circuit between the generator and the battery is controlled by the ignition switch.

Lamps.—Head lamps are 6-8 volt, 15 cp. Dash and tail lamps are in series. They are each 3-4 volt, 2 cp.

Circuit Breaker.—There is a vibrating type circuit breaker in the lighting switch to take the place of fuses in the light circuits. It should take 25 amperes to start this device vibrating, but once set vibrating, 3 to 5 amperes will cause it to continue.

Model Numbers.—Motor-generator is No. 82. Motor clutch is No. 12207. Ignition coil is No. 2127. Combination switch is No. 1106 on 1918 and No. 1071 on 1917 cars. Distributor is No. 5147 on 1918 and No. 5134 on 1917 cars.

Plate No. 19

DORT

MODELS 5 AND 5A (1916) MODELS 6 AND 9 (EARLY 1917) (Using Frame 400 Generator) WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM CONNECTICUT IGNITION

BATTERY.—Battery is 6 volt, 80 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Breaker contacts separate .025 to .027 inch. They are made of tungsten. When the condition of the points affects the ignition, renew the inner breaker mechanism. For temporary service, resurface contacts with fine emery cloth.

OILING.—Refill the cup under breaker head with pure vaseline and turn down every month. If car is driven more than 1000 miles in a month, this must be done every 1000 miles. Do not put grease or oil in the cup.

TIMING.—Breaker contacts begin to separate when the mark "1-4 DC" on flywheel is 1 inch past indicator, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 3, 4, 2.

SPARK PLUG GAPS.—Spark plug gaps are .025 inch.

STARTER.—Frame No. 318. Style 239-409 (1916) or 248-542 (1917). Starter is connected to engine through a Bendix drive. Torque at 1500 R.P.M. is 2 pound-feet. Lock torque is 11.5 pound-feet, current being 400 amperes.

OILING.—Refill starter oil wells with light engine oil every three months.

GENERATOR.—Frame No. 400. Style No. 248-089. Generator current regulation is by third brush. Maximum charging current of 12-14 amperes is reached at 20-25 miles per hour. Generator output is 14 amperes at 7.4 volts.

OILING.—Put several drops of light engine oil in each of generator oilers every two weeks. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.

RELAY.—Relay closes at 7-9 and opens at 5-7 miles per hour. Charging current is .5 to 1.5 amperes at closing and the discharge current 0 to 1 ampere at opening of relay. Contacts separate .013 to .017 inch. Air gap between relay armature (moving member) and coil core is .027 to .030 inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 15 cp. Dash lamp is 6-8 volt, 2 cp. Tail lamp is 6-8 volt, 4 cp.

FUSES.—Fuses are 10 ampere.

Plate No. 20, Cole, Model 880 (1917), Delco System

Cole

Model 880 (1917)

Delco Generating, Starting and Lighting System

Delco Ignition

Battery.—Battery is 6 volt, 100 ampere-hour. The negative (—) terminal is grounded.

Ignition.—Breaker contacts should separate .018 inch. They are made of tungsten. They will operate properly even though very irregular, due to the fact that the rough surfaces fit each other perfectly. Their natural color is dark gray, not silver. Should they become badly burned or pitted, affecting the ignition, remove and resurface them by drawing across a piece of fine emery cloth laid on a flat surface, as on the bed of a drill press, finishing on a very hard oil stone. Clean all oil from contacts before again putting into service.

Timing.—Breaker contacts should separate when piston entering power stroke is on top dead center, spark control lever and breaker assembly in fully retarded position.

Firing Order.—The firing order is 1R, 4L, 2R, 3L, 4R, 1L, 3R, 2L.

Spark Plug Gaps.—Spark plug gaps should be .028 to .030 inch.

Oiling.—Put 4 or 5 drops of light engine oil in oil hole on side of distributor housing every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Starter.—Starter is Model No. 72. It is connected to the engine through a Bendix drive. Running freely, starter should draw 40 amperes or less. It should deliver 17.5 pound-foot lock torque, with a line voltage of 3.5-3.8 volts.

Oiling.—Starter bearings are of the oilless type and require no lubrication.

Generator.—Generator current regulation is by third brush method.

GENERATOR DATA, MODEL NO. 113

Cold-Amperes	R. P. M.	Warm-Amperes	R. P. M.
Neutral	500	Neutral	500
11.5-13.5	900	11-13	900
16.5-19.5	1400	16-18	1400
16.5-18.5	1800	15-18	1800
15.0-18	2000	14-16	2000

To adjust charging rate, loosen the two screws which hold third brush arm. Move to the right to increase charging rate and to the left to decrease. Maximum output should not exceed 20 amperes at 20-25 miles per hour.

Oiling.—Put 6 or 8 drops of light engine oil in the oil hole at forward end of generator and in oil cup at commutator end, every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Relay.—There is no relay. The circuit between the generator and battery is controlled by the ignition switch.

Lamps.—Head lamps are 6-8 volt, 20 cp. Side lamps are 6-8 volt, 2 cp. Dash and tail lamps are 6-8 volt, 2 cp.

Circuit Breaker.—There is a vibrating circuit breaker in the lighting circuit to take the place of fuses. It requires a current of 25 amperes to start this device vibrating, but a current of 3 to 5 amperes will cause it to continue.

Mod 1 Numbers.—Starter is No. 72. Generator is No. 113. Ignition coil is No. 2146. Distributor is No. 5158. Starter switch is No. 1963.

Moon, Models 6-39 and 6-40 (1916), Delco System
Plate No. 21

SERVICE ENGINEERING COMPANY, SAN FRANCISCO—COPYRIGHTED, 1926

Moon

Models 6-30 and 6-40 (1916)

Delco Generating, Starting and Lighting System Delco Ignition

Battery.—Battery is 6 volt, 100 ampere-hour. The negative (—) terminal is grounded.

Ignition.—Breaker contacts separate .018 inch. They are made of tungsten. When the condition of the points affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

Timing.—Contacts begin to separate when the piston entering power stroke is on top dead center, spark control midway between the fully retarded and fully advanced positions. Spark control is both automatic and manual.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps—Spark plug gaps are .027 to .030 inch.

Oiling.—Put 3 or 4 drops of light engine oil in the oiler in side of breaker assembly every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Starter-Generator.—Model No. 73 or 83. Starter and generator are combined into one frame, but are electrically separate. Starter is connected to engine through a set of reduction gears meshed by the operator. Two overrunning clutches are provided. In connection with the ignition switch, a circuit is closed allowing current to flow through the generator windings causing the armature to revolve slowly, aiding the meshing of the reduction gears. One clutch permits this rotation, and also permits a relatively high speed of the armature, necessary when operating as a starter. The second overrunning clutch prevents the engine from driving the armature through the reduction gears. Depressing the starting pedal meshes the reduction gears, opens the generator circuit and allows the motor brush to come into contact with the commutator, closing the starter circuit and cranking the engine. When the pedal is released, a spring reverses these operations.

Generator.—Generator current regulation is by third brush system. Generator begins to supply current at 8 miles per hour, or 400 R. P. M. of armature.

GENERATOR DATA, MODELS 73 AND 83

Amperes	R. P. M.
Neutral	400
6-10	600
16-20	1000
10-15	1500
9-13	1800

Output is varied by adjusting third brush setting. Moving third brush in direction of armature rotation increases the output. Moving brush in the opposite direction decreases the output. When running freely as a motor, clutch at driving end the only retarding force, current is 4.5 amperes.

Oiling.—Put 4 or 5 drops of light engine oil in rear starter-generator oiler and fill the front oiler every two weeks. If car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles. Refill and turn down the grease cup for lubricating motor clutch once a month.

Relay.—There is no relay. The circuit between the generator and the battery is controlled by the ignition switch. The overrunning clutch at driving end allows generator to operate as a motor when battery's pressure is above that of generator. If engine is killed when stopping, the noise made by the clutch serves to attract the operator's attention, to open the ignition switch. The opening and closing of the generator-battery circuit by the operator takes the place of the relay.

Lamps.—Head lamps are 6-8 volt, 15 cp. Dash lamp is 6-8 volt, 2 cp. Tail lamp is 6-8 volt, 2 cp.

Circuit Breaker.—A vibrating circuit breaker takes the place of fuses. It requires 25 amperes to start this device vibrating. While vibrating the current flow is 3-5 amperes.

FRANKLIN

SERIES 8 (1916) AND 9 (1917-18)

DYNETO GENERATING, STARTING AND LIGHTING SYSTEM ATWATER-KENT OR EISEMANN MAGNETO IGNITION

BATTERY:—Battery is 12 volt, 60 ampere hour. The two wire system is used.

IGNITION:—Breaker contacts separate .010 on the battery ignition and .012 to .015 inch on the magneto. They are made of tungsten. When the condition of the contacts affects the ignition remove and resurface with a fine flat jeweler's file or worn No. 00 sandpaper. Resurface battery ignition contact points on an emery wheel, finishing on a hard oilstone.

OILING:—Put a drop of light engine oil on each of the wearing points of the breaker and 4 or 5 drops in the oiler on the side of the notched shaft every 500 miles or two weeks. With magneto ignition, put several drops of light engine oil in each oiler every 1000 miles or each month.

Timing:—Breaker Contacts begin to separate when the mark "CL-16" on fly wheel is $1\frac{3}{4}$ inches past indicator spark control lever and breaker assembly in the fully retarded position. With battery ignition the breaker contacts begin to open when the mark is $1\frac{1}{2}$ inches before the indicator.

FIRING ORDER.—The firing order is 1, 4, 2, 6, 3, 5.

SPARK PLUG GAPS.—Spark plug gaps are .023 to .031 inch.

STARTER-GENERATOR.—Starter and generator are combined into one unit. Armature is permanently connected to engine crank shaft.

Starter Data. Model DS L, Size B.

Torque	R.P.M.	Amperes	Volts
0 lb. ft.	800	10	12.0
5 lb. ft.	425	40	11.8
10 lb. ft.	300	65	11.5
15 lb. ft.	230	95	11.2

25 lb. ft.	110	140	10.4
30 lb. ft.	75	160	10.2
35 lb. ft.	45	180	10.0
40 lb. ft.	Lock	210	9.6

GENERATOR.—Generator current regulation is by reverse series field. Generator begins to supply current at 7-8 miles per hour. Maximum charging rate of 10-12 amperes is reached at 16-20 miles per hour.

Amperes	Generator Data. Model D.S.L., Size B.	M.P.M.
0.0		7.5
5.0		9.0
7.5		10.0
10.0		12.5
12.5		17.5
10.0		27.5
6.0		50.0

OILING.—Put several drops of light engine oil in each of starter-generator bearing oilers every two weeks. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.

LAMPS.—Head lamps are 12-16 volt, 18 cp. Dimmer lamps are 12-16 volt, 4 cp. Dash lamp is 6-8 volt, 2 cp. Tail lamp is 6-8 volt, 2 cp. All other lamps are 12-16 volts, 4 cp. On 1917-18 cars, head lamps are 6-8 volt, 21 cp.

FUSES:—Fuses are 10 ampere.

Saxon

Models B-5-R, B-6-R (1917) (Serial Nos. 9600 to 19399) Wagner Generating, Starting and Lighting System Atwater Kent Ignition

Battery.—Exide, Type 3-XC-13-1, 6 volt, 80 ampere-hour. The positive (+) terminal is grounded.

Ignition.—Type K-3, clockwise rotation. Breaker contacts separate .010 to .012 inch. They are made of tungsten. When the condition of the points affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

Oiling.—Put a drop of light engine oil on each of the wearing parts of the breaker, and put 4 or 5 drops of light machine oil in the oil hole beside the notched shaft, every two weeks. Put a very small amount of vaseline on the notched shaft, applying with a toothpick. If car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

Timing.—Breaker contacts begin to separate when piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plug Gaps.—Spark plug gaps are .028 to .031 inch.

Starter.—Model EM-156, Type 36-T. Starter is connected to the engine by a Bendix drive.

Oiling.—Put 4 or 5 drops of light engine oil in each of starter oilers every month.

Generator.—Model EM-174, Type 41-T. Generator current regulation is by third brush system. Rotation is clockwise, viewed from commutator end. Maximum output of 16 amperes is reached at 20 miles per hour.

Amperes	GENERATOR DATA	R. P. M.
3		1600
8		2000
14		2800
16		3600
15.5		4000
13		5000

Oiling.—Put 5 or 6 drops of light engine oil in each of generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Relay.—Relay closes at 8-10 miles per hour and opens at 6-8 miles per hour. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sand paper. Remove all grit. Adjust before again putting into service.

Lamps.—Head lamps are 6-8 volt, 12 cp. Tail lamp is 6-8 volt, 2 cp.

WAGNER STARTING AND LIGHTING SYSTEM
ATWATER-KENT IGNITION

Plate No. 25

Plate No. 26

CASE MODEL U (1918-19) WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM WESTINGHOUSE IGNITION

Battery.—Battery is 6 volt, 117½ ampere-hour. The positive (+) terminal is grounded.

Ignition.—Breaker contacts separate .006 to .008 inch. When the condition of the points affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sand paper. Adjust the distributor brush springs so that the brushes extend ¼ inch from their holders when the distributor cap is removed, retaining them, however, so that they do not fall out. Brushes must move freely in their holders. See that the brushes on the top and bottom of the rotor are in place when installing rotor.

Oiling.—Put 2 or 3 drops of light machine oil in oiler at side of ignition unit every month. If car is driven more than 1000 miles in a month, oiling must be done every 1000 miles.

Timing.—Breaker contacts begin to separate when piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position. Contacts begin to separate when the end of the distributor rotor is directly opposite the V notch on rim of case.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—Spark plug gaps are .023 to .027 inch.

Starter.—Frame No. 711. Starter is connected to engine through a Bendix drive. Torque at 1250 R. P. M., is 2.5 pound-feet. Lock torque is 16 pound-feet, with 525 amperes.

Generator.—Frame No. 760. Generator current regulation is by third brush system. Current output is varied by adjustment of third brush setting. Set the third brush so that at 1100-1500 R. P. M., the maximum current output is 15 to 17 amperes, at 7½ volts. The cold test readings are obtained with the normal setting of third brush, and a generator temperature under 35° C. (95° F.). The hot test readings are obtained after the generator has been operated one hour at 1800 R. P. M., charging a half-charged battery or its equivalent.

GENERATOR DATA

Cold Test		
R. P. M.	Generator Output—Amperes	Generator Voltage
500	0	6.5
750	8	6.5
1250	15-17	7.5
2500	7-11	6.5-7.5

Hot Test		
R. P. M.	Generator Output—Amperes	Generator Voltage
1250	12-14	7.5
2500	7-11	6.5-7.5

Field current is 2.8 to 3.25 amperes, 6 volts. Field resistance is 1.9 to 2.25 hr at 25° C. (77° F.).

Field Test, Generator Operating—Cold Test

R. P. M.	Generator Output Amperes	Generator Voltage	Field Current
1250	15-17	7.5	1.5-2.4

Hot Test

R. P. M.	Generator Output Amperes	Generator Voltage	Field Current
1250	12-15	7.5	1.5-2.2

Operating freely as a motor, current flow is 3.5 to 5 amperes, 6 to 6.6 volts.

Oiling.—Put 5 or 6 drops of light engine oil in each of generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Relay.—Relay closes at 8-10 miles per hour or 500-550 R. P. M. of armature, and opens at 6-8 miles per hour, or 450-500 R. P. M. of armature. Charging current is 1 to 2 amperes at closing, and the discharge current 0 to 2 amperes at opening of relay. Air gap between relay armature (moving member) and coil core is .031 inch, contacts separated. Contacts separate .013 to .018 inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sand paper. Remove all grit. Adjust before again putting into service.

Lamps.—Head lamps are 6-8 volt, 18 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash lamp is 6-8 volt, 2 cp. Tonneau lamp is 6-8 volt, 2 cp. Tail lamp is 6-8 volt, 2 cp.

Fuses.—Generator fuse is 5 ampere. Lighting fuses are 20 ampere.

DOUGLAS

1919

WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM WESTINGHOUSE IGNITION

BATTERY.—Prest-O-Lite, 6 volt, 80 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Breaker contacts separate .008 inch. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper. Adjust the distributor brush springs so that the brushes extend 1/4 inch from their holders when the distributor cap is removed, retaining them, however, so that they do not fall out. Brushes must move freely in their holders. See that the brushes on the top and bottom of the rotor are in place when installing rotor.

OILING.—Put 2 or 3 drops of light engine oil in the oil cup at the side of the ignition unit every month. If the car is driven more than 1000 miles in a month, the oiling must be done every 1000 miles.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1R, 1L 3R, 3L, 4R, 4L, 2R, 2L.

SPARK PLUG GAPS.—Spark plug gaps are .025 inch.

STARTER.—Frame No. 700. Starter is connected to the engine through a Bendix drive. Torque at 1200 R.P.M. is 2.5 pound-feet. Lock torque is 12.5 pound-feet, current being 400 amperes.

OILING.—Put 5 or 6 drops of light engine oil in each of the starter oilers every month.

GENERATOR.—Frame 400. Generator current regulation is by the third brush system. Maximum current output is 14-16 amperes, reached at 1250 R.P.M. of the armature or 20 miles per hour.

Generator Data

Amperes	Cold Test	
	R.P.M.	Volts
0	525	6.2
4	675	6.6
8	825	6.8
12	1000	7.1
15	1250	7.2
13	1750	7.2
10	2250	7.0

Charging rate may be increased by loosening the three screws holding the third brush plate and moving the plate in the direction of armature rotation. To decrease the charging rate move the third brush plate in the opposite direction.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 7-9 miles per hour or 525-575 R.P.M. of the armature and opens at 5-7 miles per hour or 475-525 R.P.M. of the armature. Charging current is .5 to 1.5 amperes at closing and the discharge current 0 to 1 ampere at the opening of relay contacts. Relay contacts separate .030 inch. Air gap between relay armature and coil core is .020 inch, contacts closed. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 16 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp.

Wagner Generating, Starting and Lighting System

Remy Ignition

Plate No. 28

Battery.—Willard, Type SJW-3, 6 volt, 90 ampere-hour. The positive (+) terminal is grounded.

Ignition.—Breaker contacts separate .020 to .025 inch. When the condition of the points affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sand paper.

Oiling.—Refill the cup under the distributor head with soft cup grease and turn down two turns every two weeks. Put a small amount of vaseline on the fiber bumper of the contact arm, using a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

Timing.—Breaker contacts begin to separate when piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order of the 8 cylinder car is 1R, 1L, 3R, 3L, 4R, 4L, 2R, 2L. The firing order of the 4 cylinder cars is 1, 2, 4, 3.

Spark Plug Gaps.—Spark plug gaps are .030 inch.

Starter.—Model EM-161, Type 36-T, or Model EM-168, Type 36-T. Starter is connected to the engine through a Bendix drive.

Oiling.—Put 5 or 6 drops of light engine oil in each of starter oilers every month.

Generator.—Model EM-169, Type 41-W, or Model EM-162, Type 41-W. Generator current regulation is by third brush system. Rotation is counter-clockwise, viewed from commutator end. Maximum current output of 16 amperes is reached at 20 miles per hour.

GENERATOR DATA

MODEL EM-169 (8 cylinder cars)		MODEL EM-162 (4 cylinder cars)	
Amperes	R. P. M.	Amperes	R. P. M.
3	1000	6	1000
10	1400	11	1300
15	1800	13.5	1500
16	2100	16	1900
14.5	2500	14	2500
10.5	3000	11.5	3000

Oiling.—Put 5 or 6 drops of light engine oil in each of generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Relay.—Relay closes at 8-10 miles per hour and opens at 6-8 miles per hour. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sand paper. Remove all grit. Adjust before again putting into service.

Lamps.—Head lamps are 6-8 volt, 20 cp. Dimmer lamps are 6-8 volt, 5 cp. Dash, tail and footboard lamps are 6-8 volt, 2 cp.

Model T (1917)

Auto-Lite Generating, Starting and Lighting System
Connecticut Ignition

Plate No. 29

Battery.—Battery is 6 volt, 85 ampere-hour. The negative (—) terminal is grounded at the starting motor.

Ignition.—Breaker contacts should separate .023 inch. They are made of tungsten. They will operate properly even though quite rough. Should they become badly worn, affecting the ignition, the inner breaker mechanism should be renewed. In an emergency, contacts may be resurfaced enough to give service for 300 or 400 miles by drawing a piece of fine, emery cloth between them.

Timing.—Contacts should begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plug Gaps.—Spark plug gaps should be .027 inch.

Oiling.—Refill the cup under the breaker head with pure vaseline and turn down every month. If the car is driven more than 1000 miles in a month, this must be done every 1000 miles. Do not put grease or oil in the cup.

Starter.—Starter is connected to engine through a Bendix drive. Cold engine, heavy oil, tight bearings or other obstructions, or damp, grounded or short circuited windings will cause high current and low speed during the cranking operation. Discharged, dry or sulphated battery, defective battery connections, defective switch contacts, defective starter connections, dirty commutator, high mica, dirty or sticking brushes, defective connections between armature coils and commutator bars or open circuits are the chief causes of low speed and low current.

Oiling.—Starter bearings are packed with grease. Thoroughly clean out and repack with soft cup or ball bearing grease every six months. No oil is required.

Generator.—Generator current regulation is by third brush system.

GENERATOR DATA, MODEL GH

Amperes	R. P. M.
5	760-820
10	1020-1100
12.5	1200-1300
15	1460-1675
15.0-16	1950-2250

When operating as a motor, generator should take 2.7 amperes, armature revolving at 450 R. P. M. Much higher speed indicates damp, grounded or short circuited field coils. Greater current or lower speed indicates tight bearings or damp, grounded or short circuited armature windings or commutator. Shunt field should take 1.7 amperes. Brush pressure on commutator should be 1 to 1 1/4 pounds. Should it be necessary to operate generator with excessive resistance in the charging circuit, as with battery disconnected, short circuit generator terminals.

Oiling.—Put 6-8 drops of light engine oil in each of the generator oilers every two weeks. If car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

Relay.—Relay should close at 8-10 miles per hour, or 550-600 R. P. M., of armature. Charging current should be .5 to 1.5 amperes at closing, and the discharge 0 to 1 ampere at opening of relay contacts. Clean relay contacts by drawing a piece of unglazed paper between them. If badly burned or pitted, resurface with a strip of well worn No. 00 sand paper, and then draw a piece of unglazed paper between them to remove all grit. Adjust before again putting into service.

Lamps.—Head lamps are 6-8 volt, 20 cp. Dimmer lamps are 6-8 volt, 5 cp. Dash lamp is 6-8 volt, 4 cp. Tail lamp is 6-8 volt, 4 cp. Trouble lamp is 6-8 volt, 4 cp. Single contact base is used on all lamps.

Plate No. 30

Saxon

1915

DETROIT WARD-LEONARD GENERATING, STARTING AND LIGHTING SYSTEM ATWATER KENT IGNITION

BATTERY.—Battery is 6 volt, 60 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Type K-3. Breaker contacts separate .010 to .012 inch. They are made of tungsten. When the condition of the points affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING.—Put a drop of light engine oil on each of the wearing parts of the breaker and and 4 or 5 drops of light engine oil in the oil hole beside the notched shaft every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

TIMING.—Breaker contacts separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4, or 1, 3, 4, 2.

SPARK PLUG GAPS.—Spark plug gaps are .027 to .030 inch.

STARTER-GENERATOR.—Model R.S. Starter and generator are combined into a single unit. Starter is connected to the engine through a chain drive.

Starter Data

Torque	R. P. M.	Amperes	Volts
2 lb. ft.	1250	100	5.4
4 lb. ft.	1000	135	5.1
6 lb. ft.	700	175	4.8
8 lb. ft.	500	220	4.5
10 lb. ft.	300	260	4.2
12 lb. ft.	200	300	3.9

The lock torque is 20-23 pound-feet. Starter cranks the engine at 220 R. P. M.

GENERATOR.—Generator current regulation is by the Ward-Leonard Vibrator Regulator. Maximum current output of 10 amperes is reached at 1800-2000 R. P. M. of armature, or 11-12 miles per hour. Generator current remains constant at all speeds above 13 miles per hour.

OILING.—Put 5 or 6 drops of light engine oil in each of starter-generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY-REGULATOR.—Type CC. Relay closes at 8-9 miles per hour. Adjust regulator to limit the maximum current output to 10 amperes. Increasing spring tension on regulator armature (moving member) will increase the output. Decreasing spring tension will decrease the output. Clean relay and regulator contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 14 cp. Dash and tail lamps are each 6-8 volt, 2 cp.

Plate No. 31

Reo

MODELS R, S, M AND N (1917) REMY GENERATING, STARTING AND LIGHTING SYSTEM REMY IGNITION

- BATTERY.**—Battery is 6 volt, 100 ampere-hour. The two wire system is used.
- IGNITION.**—Breaker contacts separate .020 to .025 inch. When the condition of the points affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.
- OILING.**—Refill the cup under the distributor head with soft cup grease and turn down two turns every two weeks. Put a small amount of vaseline on the fiber bumper of the contact arm, using a toothpick. If the car is driven more than 500 miles in two weeks, these attentions should be given every 500 miles.
- TIMING.**—Breaker points begin to separate when mark "UDCI-4" or "UDCI-6" on fly-wheel is 1 to 1 3/4 inches past indicator, spark control lever and breaker assembly in the fully retarded position.
- FIRING ORDER.**—The firing order of the four-cylinder cars is 1, 3, 4, 2. The firing order of the six-cylinder cars is 1, 4, 2, 6, 3, 5.
- SPARK PLUGS.**—Spark plug gaps are .027 to .030 inch.
- STARTER.**—Model No. 300-A-B. Starter is connected to engine through a set of reduction gears, chain and ratchet clutch.

Starter Data.

Torque	R. P. M.	Amperes	Volts
1 lb. ft.	780	65	6.0
3 lb. ft.	600	90	5.9
6 lb. ft.	460	120	5.7
8 lb. ft.	400	140	5.6
10 lb. ft.	360	160	5.5
68 lb. ft.	Lock	585	3.3

- OILING.**—Put several drops of light engine oil in each of starter bearing oilers every month. Remove plug and replenish grease in reduction gear case every six months.
- GENERATOR.**—Models Nos. 254A and 256A. Generator current regulation is by third brush system. A thermostat located in the brush rigging of the generator, cuts in a resistance at a temperature of 175° F., reducing the maximum charging rate 6 amperes. Resistance also acts as a shunt field fuse. The thermostat is intended to change the charging rate as demand of seasons or car operation requires. Never touch the thermostat points.

Generator Data.

High Battery			Low Battery		
Amperes	R. P. M.	Volts	Amperes	R. P. M.	Volts
0	350	6.40	0	330	5.90
7	510	7.13	7	500	6.24
13	690	7.76	13	680	6.58
20	1100-1500	9.0	18	1000-1200	6.84

Field current is 5 amperes at 6.4 volts. When generator is operating freely as a motor, the current is 4.75 amperes at 6.4 volts, armature turning at 245 R. P. M.

- OILING.**—Put several drops of light engine oil in each of generator oilers every two weeks. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.
- RELAY.**—Relay closes at 7-9 miles per hour or 350 R. P. M., of armature, and opens at 5-7 miles per hour, or 300-350 R. P. M. of armature. Charging current at closing is 1 to 3 amperes and the discharge current 0 to 1 ampere at opening of relay. Contacts separate .012 to .015 inch. Air gap between relay armature and coil core is .012 to .015 inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. And adjust before again putting into service.
- LAMPS.**—Head lamps are 6-8 volt, 15 cp. Dash and tail lamps are in series. They are each 3-4 volt, 2 cp. Tail lamp provided with switch to provide a means of control at lamp where ordinances require it.
- FUSES.**—Fuses are 5 amperes.

Commonwealth

Model 440 (1918)

Dyneto Generating, Starting and Lighting System

Atwater Kent Ignition

Battery.—Battery is 6 volt, 83 ampere-hour. The negative (—) terminal is grounded.

Ignition.—Breaker contacts separate .010 to .012 inch. They are made of tungsten. When the condition of the points affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

Oiling.—Put a drop of light engine oil on each of the wearing parts of breaker, and put 4 or 5 drops of light machine oil in the oil hole beside the notched shaft, every two weeks. Put a very small amount of vaseline on the notched shaft, applying with a toothpick. If car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

Timing.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plug Gaps.—Spark plug gaps are .025 to .031 inch.

Starter.—Starter is connected to engine through a Bendix drive.

Oiling.—Put several drops of light engine oil in each of starter bearings every three months.

Generator.—Generator current regulation is by third brush system.

GENERATOR DATA, MODEL CA

Amperes	M. P. H.	Volts
0	7	6.4
5	9	6.5
10	12.5	6.8
12.5	18	7.0
10	35	6.5

Oiling.—Put several drops of light engine oil in each of generator oilers every month. If car is driven more than 1000 miles in a month, oiling must be done every 1000 miles.

Relay.—Relay closes at 7-9 and opens at 5-7 miles per hour. Charging current is 1-3 amperes at closing, and the discharge current 0 to 1 ampere at opening of relay. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sand paper. Remove all grit. Adjust before again putting into service.

Lamps.—Head lamps are 6-8 volt, 15 cp. Dash lamp is 6-8 volt, 2 cp. Tail lamp is 6-8 volt, 4 cp.

Fuses.—Fuses are 10 ampere.

Metz

Model 25 (1916-17-18)

Gray and Davis Generating, Starting and Lighting System Bosch or Dixie Magneto Ignition

Battery.—Battery is 6 volt, 70 ampere-hour. The positive (+) terminal is grounded at the starting motor.

Ignition.—Breaker contacts separate .014 to .016 inch on the Bosch Magneto or .018 to .020 inch on the Dixie Magneto. When the condition of the points affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sand paper.

Timing.—Breaker contacts separate when piston entering power stroke is on top dead center, spark control lever about one inch from the fully retarded position. (First see that the breaker assembly is fully retarded when the control lever is in the fully retarded position.)

Firing Order.—The firing order is 1, 2, 4, 3.

Spark Plug Gaps.—Spark plug gaps are .024 to .026 inch on models using Bosch Magneto, and .030 to .034 inch on models using Dixie Magneto.

Oiling.—Put 2 or 3 drops of light machine oil in Bosch Magneto oilers every month. Fill oil wells on Dixie Magneto every month. If car is driven more than 1000 miles in a month, the oiling must be done every 1000 miles.

Starter.—Starter is connected to the engine through a set of reduction gears and a pinion shifted by the operator. When operating without load starter draws 35 amperes at 3 volts pressure, and runs at 3500 R. P. M. With the same current at 5.5 volts, starter turns at 6600 R. P. M., and 7000 R. P. M. with 6 volts pressure. Starter torque is 1.5 pound-feet at 2400 R. P. M., taking 137 amperes. Pressure of starter brushes on commutator should be 3½ pounds.

Oiling.—Put 8 to 10 drops of light engine oil in starter oilers every two weeks. Oil the sliding surfaces and rods at the same time. Every three months remove the oil plug in reduction gear case and inject one tablespoonful of heavy motor oil.

Generator.—Generator output regulation is by vibrating regulator. Generator current is 10 amperes at 1300 R. P. M. Charging rate will vary with condition of battery, being highest when battery is discharged and decreasing as the battery charges. With a 7½ ampere lamp load, the charging rate is 1 to 4.5 amperes. Running freely as a motor, generator takes 3 amperes at 6 volts pressure, and armature revolves at 650 R. P. M. Shunt field takes 1.04 to 1.30 amperes.

Oiling.—Put 5 or 6 drops of light engine oil in each of generator oilers every two weeks. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.

Relay-Regulator.—Relay and regulator are combined into one unit. Relay closes at 10 miles per hour. The terminal marked "B" is the negative (—) generator terminal and is connected to the battery. Terminal "L" is also negative, but supplies current to lights only. It is a tap taken off the series winding some distance from the end. "B" is the end of series regulator winding. When the lamps are turned on the frequency at which armature (moving member) operates is reduced, increasing the output in proportion to lamp load. Clean relay and regulator contacts by drawing unglazed paper between them. When badly burned or pitted, resurface with a fine, flat jeweler's file or worn No. 00 sand paper. To adjust contacts, hold one set apart and adjust the other set until the desired output is attained. Then hold the first set apart and adjust the other set until the desired output is attained. Then allow both sets to operate together. Increasing spring tension will increase the output. Decreasing the spring tension will decrease the output. Generator armature should be driven at 1750 R. P. M. while adjusting regulator.

Lamps.—Head lamps are 6-8 volt, 15 cp. Dimmer lamps are 6-8 volt, 4 cp. Tail lamp is 6-8 volt, 2 cp.

Fuses.—Four fuses mounted on rear of lighting switch are 5 ampere.

Auburn

Mod 1 6-39 (1917-18)

Remy Generating, Starting and Lighting System Remy Ignition

Battery.—Battery is 6 volt, 80 ampere-hour. The positive (+) terminal is grounded.

Ignition.—Breaker contacts separate .025 inch. When the condition of the points affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sand paper.

Oiling.—Refill the cup under the distributor head with soft cup grease and turn down two turns every two weeks. At the same time put a small amount of vaseline on the fiber bumper of the contact arm, using a toothpick. If the car is driven more than 500 miles in two weeks, these attentions should be given every 500 miles.

Timing.—Breaker contacts begin to separate when the top dead center mark on the fly-wheel is $1\frac{1}{2}$ inches past indicator, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—Spark plug gaps are .030 inch.

Starter.—Starter is connected to the engine through a Bendix drive.

STARTER DATA, MODEL No. 292-A

Torque	R. P. M.	Amperes	Volts
0 lb. ft.	3300	60	6.0
1 lb. ft.	2400	110	5.7
4 lb. ft.	1000	270	4.6
7 lb. ft.	225	395	3.7
9 lb. ft.	50	435	3.6
10-11 lb. ft.	Lock	450	3.6

Oiling.—Put 4 or 5 drops of light engine oil in each of starter oilers every month.

Generator.—Generator current regulation is by vibrating regulator.

GENERATOR DATA, MODEL No. 168-E

Amperes	R. P. M.	Volts
0	500-550	6.0
7	680-750	6.4
14.5	2400-2900	7.2

Operating freely as a motor, generator takes 5.5 amperes at 5.85 volts and runs at 400 R. P. M. Shunt field takes 4 amperes at 5.9 volts.

Oiling.—Put 4 or 5 drops of light engine oil in each of generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Relay-Regulator.—Relay closes at 6-8 miles per hour and opens at 4-6 miles per hour. The air gap between relay armature (moving member) and coil core is .012 to .015 inch. Contacts separate .012 to .015 inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sand paper. Remove all grit. Adjust before again putting into service. Increasing spring tension on regulator armature will increase charging rate, and decreasing spring tension will decrease charging rate.

Lamps.—Head lamps are 6-8 volt, 17 cp. Dimmer lamps are 6-8 volt, 5 cp. Dash and tail lamps are 6-8 volt, 2 cp.

Fuse.—There is a 15 ampere fuse on relay-regulator base. Use 15 ampere commercial fuse wire in replacing it.

Model Numbers.—Starter is No. 292-A Generator is No. 168-E. Relay-regulator is No. 60-A. Ignition coil is N 174-A or 284-C.

Auburn, Model 6-39 (1917-18), Remy System

Plate No. 34

Abbot-Detroit

Model 6-44 (1916-17)

Remy Generating, Starting and Lighting System Remy Ignition

Battery.—Battery is 6 volt, 80 ampere-hour. The positive (+) terminal is grounded.

Ignition.—Contacts should separate .020 to .025 inch. Should they become badly burned or pitted, affecting the ignition, resurface them with a very fine, flat jeweler's file or a strip of worn No. 00 sand paper. The rebound spring should be at least .020 inch from the breaker arm when contacts are at their maximum opening.

Timing.—Contacts should begin to separate when the piston entering power stroke in on top dead center, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—Spark plug gaps should be .025 to .030 inch.

Oiling.—Refill the cup under the distributor head with soft cup grease and turn down two turns every two weeks. At the same time put a small amount of vaseline on the fiber bumper of the contact arm, using a toothpick. If the car is driven more than 500 miles in two weeks, these attentions should be given every 500 miles.

Starter.—Starter is connected to the engine through a Bendix drive. When operating freely, motor should take 55-65 amperes at 6 volts, armature revolving at 3600-4000 R. P. M.

STARTER DATA, MODEL 180-A

Torque	R. P. M.	Amperes	Volts
0 lb. ft.	3600-4000	55-65	6.0
4 lb. ft.	1200-1450	200-220	4.6
6 lb. ft.	900-1100	290-310	4.5
10 lb. ft.	300-450	460-600	3.6
14 lb. ft.	Lock	550-600	3.2

Oiling.—Put several drops of light engine oil in each of the starter oilers every month.

Generator.—Generator current regulation is by a vibrating regulator.

GENERATOR DATA, MODEL 245-A

Amperes	R. P. M.	Volts
0	600-650	6.0
7	700-750	6.5
13-14	1500	6.9
13-14	3000	6.9

If operated freely as a motor, generator should take 6 to 6.5 amperes at 5.8 volts, armature revolving at 470 R. P. M. Much greater speed indicates damp, grounded or short circuited field coils. Low speed and excessive current or periodic winging of ammeter needle at low speed indicates damp, grounded or short circuited field coils or commutator bars or tight bearings. Shunt field should take 3.5 to 4 amperes at 5.9 volts.

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Relay-Regulator.—Relay is combined with regulator. The air gap between relay armature (moving member) and coil core should be .012 to .015 inch. Clean relay and regulator contacts by drawing a piece of unglazed paper between them. If badly burned or pitted, resurface with a strip of well worn No. 00 sand paper, drawing a piece of unglazed paper between them to remove all grit, and adjust before again putting into service. Increasing spring tension on regulator armature will increase the output. Decreasing the spring tension will decrease the output. There is a 15 ampere fuse in regulator base.

Lamps.—Head lamps are 6-8 volt, 17 cp. Dimmer lamps are 6-8 volt, 5 cp. Dash lamp is 6-8 volt, 2 cp. Tail lamp is 6-8 volt, 2 cp. Single contact bulbs are used.

Model Numbers.—Starter is Model No. 180-A. Generator is Model No. 245-A. Starting switch is Model 29. Lighting and ignition switch is Model 140. Relay-regulator is No. 60. Ignition coil is No. 172. Ignition timer is No. 109.

Plate No. 35

Scripps-Booth

Model G (1917) (Serial Nos. 3 to 855) Remy Generating, Starting and Lighting System Remy Ignition

Scripps-Booth, Model G (1917), Serial Nos. 3 to 855, Remy System

Plate No. 36

Battery.—Battery is 6 volt, 80 ampere-hour. The positive (+) terminal is grounded.

Ignition.—Breaker contacts should separate .020 to .025 inch. If burned or pitted, affecting the ignition, resurface them with a very fine, flat jeweler's file or a strip of worn No. 00 sand paper.

Timing.—Breaker contacts should just separate when engine is turned $\frac{3}{8}$ inch past dead center, measured on flywheel, with spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 4, 3, 2.

Spark Plug Gaps.—Spark plug gaps should be .025 to .030 inch.

Oiling.—Refill the cup under the distributor head with soft cup grease and turn down two turns every two weeks. At the same time put a small amount of vaseline on the fiber bumper of the contact arm, using a toothpick. If the car is driven more than 500 miles in two weeks, these attentions should be given every 500 miles.

Starter.—Starter is connected to the engine through a Bendix drive.

STARTER DATA, No. 290-B

Torque	R. P. M.	Amperes	Volts
0 lb. ft.	3300	60	6.0
1 lb. ft.	2400	110	5.7
4 lb. ft.	1000	270	4.0
7 lb. ft.	225	395	3.7
9 lb. ft.	50	435	3.6
10-11 lb. ft.	Lock	450	3.6

Oiling.—Put 5 or 6 drops of light engine oil in each of the starter oilers every month.

Generator.—Generator current regulation is by third brush method. A thermostat located in the rigging of the generator, cuts in a resistance at 175° F. temperature, reducing the maximum charging rate 6 amperes. Resistance also acts as a shunt field fuse. The thermostat is intended to change the charging rate as demand of seasons or car operation requires. Never touch the thermostat points.

GENERATOR DATA, No. 248-A

Amperes	R. P. M.	Volts
0	580	6.4
7	850	7.1
14	1170	7.9
22	2150	8.6
20	3000	8.4

When operating freely as a motor, generator should draw 3.8 amperes at 6.2 volts, and run at 400 R. P. M. Shunt field should take 3.8 amperes at 6.2 volts.

Oiling.—Put 4 or 5 drops of light engine oil in generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Relay.—Relay should close at 8-10 miles per hour and open at 6-8 miles per hour. Gap between relay contacts should be .012 to .015 inch. Air gap between relay armature (moving member) and coil core should be .012 to .015 inch. Clean relay contacts by drawing a piece of unglazed paper between them. If badly burned or pitted, resurface with a strip of well worn No. 00 sand paper, and then draw a piece of unglazed paper between them to remove all grit. Adjust before again putting into service.

Lamps.—Head lamps are 6-8 volts, 17 cp. Dimmer lamps are 6-8 volt, 5 cp. Dash and tail lamps are 6-8 volt, 2 cp.

Model Numbers.—Starter is No. 290-B, Generator is No. 248-A. Distributor is No. 219-A. Ignition coil is No. 248-C. Starting switch is No. 29-J.

Mod 1 Numbers.—Starter is No. 180-A. Generator is No. 161-B-C. Relay-regulator is No. 60-A. Ignition coil is No. 172-A.

CHEVROLET

MODEL 4-90 (1916-17-18)

AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM CONNECTICUT IGNITION

BATTERY.—Battery is 6 volt, 80 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Breaker contacts separate .023 inch. They are made of tungsten. When the condition of the points affects the ignition, renew the inner breaker mechanism. For temporary service, resurface contacts with fine emery cloth.

OILING.—Refill the cup under breaker head with pure vaseline and turn down every month. If car is driven more than 1000 miles in a month, this must be done every 1000 miles. Do not put grease or oil in the cup.

TIMING.—Breaker contacts begin to separate when piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 2, 4, 3.

SPARK PLUG GAPS.—Spark plug gaps are .025 to .030 inch.

THERMOSTAT.—There is a thermostatically controlled device in the ignition switch to automatically open ignition circuit, should switch be left in the "On" position, engine idle, and contacts closed. This device is shown below. The ignition current flowing through the heat element (h) causes it to bend, making contact at (m). This completes circuit through the electro-magnet (r), causing armature (p) to vibrate, applying a series of blows to switch lock (x), releasing the ignition button (a), opening the ignition circuit. Should the device fail to operate, loosen the screws holding it to the instrument board and pull out. Disconnect wire from middle connection (c). Run a wire from negative terminal of battery or from ground, and connect to the spring (e), switch closed. Make and break the connection. If a spark is given off, the contacts (c) are in good condition. If not, make necessary repairs. If they are in good condition, test the heat element (h) by bringing the free end of the test wire to terminal C. Make and break the circuit. If no spark results, either the heat element (h) is burned out, the wire K has become unsoldered from the heat element or the heat element is detached from spring (j). If heat unit is burned out, a temporary repair may be made by soldering a piece of wire from the spring (e) to terminal C. With this connection, the thermostat is inactive. Should vibrator fail to operate when the heat element makes contact at post (o), contacts are defective or there is a broken wire or ground or short circuit in magnet circuit, or magnets are burned out.

Lighting and Ignition Switch (cover removed).

Plate No. 40

CHEVROLET

MODEL 490 (1916-17-18)

AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM CONNECTICUT IGNITION

Continued from preceding page.

STARTER.—Starter is connected to engine through a Bendix drive.

OILING.—Thoroughly clean out and repack starter bearings with soft cup or ball bearing grease every six months.

GENERATOR.—Two types of generators are used, the type GG machine using reverse series field system of current regulation, and a type GH machine, using third brush system of current regulation.

Amperes	Generator Data.	Model GG	R.P.M.
5.0	---	---	750- 860
10.0	---	---	1225-1400
12.5	---	---	1600-1825
15.0	---	---	2175-2450
17-19	---	---	3200-3700

A variation of 1.5 amperes from these amounts is allowable. Current may be varied slightly by changing pressure of brushes on commutator. The correct pressure is 1 to 1¼ lbs. Operating freely as a motor, generator takes 2.8 amperes, armature revolving at 350 R.P.M. Shunt field takes 1.1 amperes.

Amperes	Generator Data.	Model GH	R.P.M.
5.0	---	---	760- 820
10.0	---	---	1020-1100
12.5	---	---	1200-1300
15.0	---	---	1460-1675
15-17	---	---	1950-2250

Operating freely as a motor, generator takes 2.7 amperes, armature revolving at 450 R.P.M. Shunt field takes 1.7 amperes.

OILING.—Put 5 or 6 drops of light engine oil in each of generator bearing oilers every 2 weeks. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.

RELAY.—Model GG generator closes the relay at 7-9 miles per hour or 500-575 R.P.M. of armature. Model GH generator closes the relay at 7-9 miles per hour or 525-600 R.P.M. of armature. Charging current is .5 to 1.5 amperes at closing and the discharge current 0 to 1 ampere at opening of relay. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 17 cp. on 1916 cars and 6-8 volt, 14 cp. on later cars.

☉ Tail lamp is 6-8 volt, 4 cp.

Plate No. 41

Oakland

Model 32 (1916)

Remy Generating, Starting and Lighting System

Remy Ignition

Battery.—Battery is 6 volt, 80 ampere-hour. The negative (—) terminal is grounded.

Ignition.—Breaker contacts should separate .020 to .025 inch. If burned or pitted, affecting the ignition, resurface them with a very fine, flat jeweler's file or a strip of worn No. 00 sand paper.

Timing.—Breaker contacts should separate when the flywheel marking "UDC 1-6" is in alignment with the indicator, with spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—Spark plug gaps should be .025 to .030 inch.

Oiling.—Refill the cup under the distributor head with soft cup grease and turn down two turns every two weeks. At the same time put a small amount of vaseline on the fiber bumper of the contact arm, using a toothpick. If the car is driven more than 500 miles in two weeks, these attentions should be given every 500 miles.

Starter.—Starter is connected to the engine through a Bendix drive.

STARTER DATA, MODEL No. 114-A

Torque	R. P. M.	Amperes
0 lb. ft.	3500-6000	35- 50
4 lb. ft.	1100-1450	190-220
6 lb. ft.	850-1050	280-300
10 lb. ft.	200- 350	320-475
14 lb. ft.	Lock	520-600

Oiling.—Put 5 or 6 drops of light engine oil in the starter bearings every month.

Generator.—Generator current regulation is by vibrating regulator.

GENERATOR DATA, MODEL No. 166

Amperes	R. P. M.	Volts
0	600- 650	6.0
7	780- 850	6.4
14.5	2500-3000	7.2

Operating freely as a motor, generator runs at 470 R. P. M., drawing 5.5 amperes at 5.8 volts.

Oiling.—Put 5 or 6 drops of light engine oil in the oiler on commutator end bearing every month. If car is driven more than 1000 miles in a month, the oiling must be done every 1000 miles.

Relay-Regulator.—Relay is combined with regulator. Relay should close at 6-8 miles per hour, and open at 5-7 miles per hour. The air gap between relay armature (moving member) and coil core should be .012 to .015 inch, contacts closed. Contacts should separate .012 to .015 inch. Clean relay and regulator contacts by drawing a piece of unglazed paper between them. If badly burned or pitted, resurface with a strip of well worn No. 00 sand paper, drawing a piece of unglazed paper between them to remove all grit, and adjust before again putting into service. Increasing spring tension on regulator armature will increase the output. Decreasing the spring tension will decrease the output.

Lamps.—Head lamps are 6-8 volt, 14 cp. Dash and tail lamps are 6-8 volt, 2 cp.

Fuse.—There is a 15 ampere fuse on relay-regulator base.

Oakland

Model 32-B (1917) (Serial Nos. 330000 to 347000)

Model 34 (1917) (Serial Nos. 134 to 3000034)

Delco Generating, Starting and Lighting Syst m
Delco Ignition

Oakland, Models 32B and 34 (1917), Delco System
Plate N . 42

Battery.—Battery is 6 volt, 80 ampere-hour. The negative (—) terminal is grounded.

Ignition.—Breaker contacts should separate .018 inch. They are made of tungsten. They will operate properly even though very irregular, due to the fact that the rough surfaces fit each other perfectly. Their natural color is dark gray, not silver. Should they become badly burned or pitted, affecting the ignition, remove and resurface them by drawing across a piece of fine emery cloth laid on a flat surface, as on the bed of a drill press, finishing on a very hard oil stone. Clean all oil from contacts before again putting into service.

Timing.—Breaker contacts should separate when piston entering power stroke is on top dead center, spark control lever two inches from the bottom of the sector. (First see that breaker assembly is fully retarded when the control lever is in the fully retarded position.)

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—Spark plug gaps should be .028 to .030 inch.

Oiling.—Distributor shaft bearings are of the oilless type. If the track of the rotor button inside distributor head is not well polished, apply a small amount of vaseline with a soft cloth.

Starter.—Starting motor No. 100 is used on both models. It is connected to the engine through a Bendix drive. Running freely, starter should draw 40 amperes. It should deliver 16 pound-feet lock torque, with a line voltage of 3.5-3.8 volts.

Oiling.—Starter bearings are of the oilless type and require no lubrication.

Generator.—Generator No. 99 is used on the Model 32-B cars, and generator No. 111 is used on the Model 34 cars. Current regulation is by third brush method.

GENERATOR DATA, No. 99 AND No. 111

Cold-Amperes	R. P. M.	Warm-Amperes	R. P. M.
Neutral	500	Neutral	500
10.5-12.5	900	10-12	900
15.5-18	1400	14-16	1400
13.0-17	2000	11-13	2000

To adjust charging rate loosen the screws holding third brush arm and move to the right (looking at commutator end of generator) to increase charging rate, and to the left to decrease it. Generator should begin to supply current at 8 miles per hour, and reaches its maximum output at 20-25 miles per hour.

Oiling.—Put 4 or 5 drops of light engine oil in the rear bearing oiler every week. If car is driven more than 250 miles in a week, the oiling must be done every 250 miles.

Relay.—There is no relay. The circuit between the generator and the battery is controlled by the ignition switch.

Lamps.—Head lamps are 6-8 volt, 14 cp. Tail lamp is 6-8 volt, 2 cp. Dash lamp is 6-8 volt, 2 cp.

Circuit Breaker.—There is a vibrating type circuit breaker in the lighting circuits to take the place of fuses. It requires a current of 25 amperes to start this device vibrating, but when vibrating, a current of 3 to 5 amperes will cause it to continue.

Model Numbers.—Both models use starter No. 100, starting switch No. 1965, ignition coil No. 2137 and combination switch No. 1078. Generator No. 99 is used on the 32-B models and No. 111 in the 34 models.

Oakland

Model 37 (1915) (Serial Nos. 370000 to 373599)
 Model 49 (1915) (Serial Nos. 490000 to 490500)
 Delco Generating, Starting and Lighting System
 Delco Ignition

Oakland, Models 37 and 49 (1915), Delco System

Plate No. 43

Battery.—Battery is 6 volt, 100 ampere-hour. The negative (—) terminal is grounded.
Ignition.—Breaker contacts separate .010 inch. When contacts are closed, contact blade and clip separate .015 inch. See that pigtail conducting current to the contact blade is not disconnected. When the condition of the points affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sand paper.

Oiling.—Put 4 or 5 drops of light engine oil in distributor bearing every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Timing.—Breaker contacts begin to separate when piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order of Model 37 is 1, 3, 4, 2 and of Model 49 is 1, 5, 3, 6, 2, 4.
Spark Plug Gaps.—Spark plug gaps are .025 to .030 inch.

Starter-Generator.—Starter and generator are combined into one unit, but are electrically separate. Starter is connected to the engine through a set of reduction gears meshed by the operator. Two overrunning clutches are provided. In connection with the ignition switch, a circuit is closed allowing current to flow through the generator windings, causing the armature to revolve slowly, aiding the meshing of the reduction gears. One clutch permits this rotation, and also permits a relatively high speed of the armature, necessary when operating as a starter. The second overrunning clutch prevents the engine from driving the armature through the reduction gears. Depressing the starting pedal meshes the reduction gears, opens the generator circuit, and allows the motor brushes to come in contact with the commutator, closing the starter circuit and cranking the engine. When the pedal is released, a spring reverses these operations.

Generator.—Generator voltage regulation is by automatic field rheostat operated from a governor on the distributor shaft.

GENERATOR DATA, MOTOR-GENERATOR NOS. 49 AND 50

Amperes	R. P. M.
Neutral	350
6-11	500
16-20	900-1050
9-14.5	1500

Charging rate is varied by changing the regulating resistance spool. There are six different spools available, namely Nos. 633, 703, 702, 701, 817 and 955. No. 633 is wound with the largest wire, the sizes reducing in the order named. Installing a spool of larger wire increases the output. The spools have a wide brass cap at one end and a narrow cap at the other end. Minimum output with each spool is obtained when installed with the narrow cap at the bottom. The contact arm must bear on the resistance spool with a pressure of 6 ounces. A poor contact between the arm and spool will cause the generator to motor at excessive speed when the ignition switch is closed.

Oiling.—Put 5 or 6 drops of light engine oil in each of starter-generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles. Once a year remove the name plate and lubricate the spiral gears with soft cup grease. Limit the amount of grease so that none can work through to the regulating resistance, interfering with its operation.

Relay.—There is no relay. The circuits between the generator and the battery is controlled by the ignition switch. The overrunning clutch at driving end allows generator to operate as a motor when battery's pressure is above that of generator. If the engine is killed when stopping the noise made by the clutch serves to attract the operator's attention to open the ignition switch. The opening and closing of the generator-battery circuit by the operator, takes the place of the relay.

Lamps.—Head lamps are 6-8 volt, 17 cp. Dash and tail lamps are 6-8 volt, 2 cp.

Circuit Breaker.—There is a vibrating circuit breaker on the back of the lighting switch which takes the place of fuses in the lighting circuits. It requires a current of 25 amperes to start this device vibrating, but when vibrating, 3 to 5 amperes will cause it to continue.

Model Numbers.—Motor-generator is Nos. 49 or 50. Ignition coil is No. 2111. Combination switch is No. 1048.

Sun

Light Six Model 17 (1917-18) Remy Generating, Starting and Lighting System Remy Ignition

Battery.—Battery is 6 volt, 85 ampere-hour. The negative (—) terminal is grounded.

Ignition.—Breaker contacts should separate .020 to .025 inch. If burned or pitted, affecting the ignition, resurface them with a very fine, flat jeweler's file or a strip of worn No. 00 sand paper.

Timing.—Breaker contacts should separate when piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—Spark plug gaps should be .025 to .030 inch.

Oiling.—Refill the cup under the distributor head with soft cup grease and turn down two turns every two weeks. At the same time put a small amount of vaseline on the fiber bumper of the contact arm, using a toothpick. If the car is driven more than 500 miles in two weeks, these attentions should be given every 500 miles.

Starter.—Starter is connected to the engine through a Bendix drive.

STARTER DATA. MODEL 180-B

Torque	R. P. M.	Amperes	Volts
0 lb. ft.	3600-4000	55- 65	6.0
4 lb. ft.	1200-1450	200-220	4.6
6 lb. ft.	900-1100	290-310	4.5
10 lb. ft.	300- 450	460-600	3.6
14 lb. ft.	Lock	550-600	3.2

Oiling.—Put 5 or 6 drops of light engine oil in the starter bearing oilers every month.

Generator.—Generator current regulation is by vibrating regulator.

GENERATOR DATA, No. 166-B

Amperes	R. P. M.	Volts
0	600- 650	6.0
7	780- 850	6.4
14.5	2500-3000	7.2

Operating freely as a motor, generator should run at 470 R. P. M., drawing 5.5 amperes at 5.8 volts. Shunt field winding should take 4 amperes at 6 volts.

Oiling.—Put 5 or 6 drops of light engine oil in the oiler on commutator end of generator every month. If car is driven more than 1000 miles in a month, the oiling must be done every 1000 miles.

Relay-Regulator.—Relay is combined with regulator. Relay should close at 8-10 miles per hour and open at 6-8 miles per hour. The air gap between relay armature (moving member) and coil core should be .012 to .015 inch, contacts closed. Contacts should separate .012 to .015 inch. Clean relay and regulator contacts by drawing a piece of unglazed paper between them. If badly burned or pitted, resurface with a strip of well worn No. 00 sand paper, drawing a piece of unglazed paper between them to remove all grit and adjust before again putting into service. Increasing spring tension on regulator armature will increase the output. Decreasing the spring tension will decrease the output.

Lamps.—Head lamps are 6-8 volt, 20 cp. Tail lamp is 6-8 volt, 2 cp.

Fuses.—There is a 15 ampere fuse on relay-regulator base. Use 15 ampere commercial fuse wire in replacing it. Other fuses are 20 ampere.

Model Numbers.—Starter is No. 180-B. Generator is No. 166-B. Ignition coil is No. 172-A. Distributor is No. 109-D-E. Relay-regulator is Model 60-A.

Grant

Model K (1917-18) (Serial Nos. 15000 to 27000) Wagner Generating, Starting and Lighting System Remy Ignition

Battery.—Willard. Type SJW-3, 6 volt, 90 ampere-hour. The positive (+) terminal is grounded.

Ignition.—Model Nos. 352-A and 284-B. Breaker contacts separate .020 to .025 inch. When the condition of the points affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sand paper.

Oiling.—Refill the cup under the distributor head with soft cup grease and turn down two turns every two weeks. Put a small amount of vaseline on the fiber bumper of the contact arm, using a toothpick. If car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

Timing.—Breaker contacts begin to separate when flywheel marking "1 and 6 TC" is $\frac{3}{4}$ inch past the indicator, spark control rod pulled out $\frac{3}{8}$ inch. (First see that breaker assembly is fully retarded when control button is pushed all the way in.)

Firing Order.—The firing order is 1, 4, 2, 6, 3, 5.

Spark Plug Gaps.—Spark plug gaps are .025 inch.

Starter.—Model EM-166, Type 36-T. Starter is connected to the engine through a Bendix drive.

Oiling.—Put several drops of light engine oil in each of starter bearing oilers every month.

Generator.—Model EM-165, Type 41-Y. Generator current regulation is by third brush system. Rotation is counter clockwise, viewed from commutator end. Maximum output of 15 amperes is reached at 20 miles per hour.

LAMPS.—Head lamps are 6-8 volt, 20 cp. Dimmer lamps are 6-8 volt, 5 cp. Dash and tail lamps are each 6-8 volt, 2 cp.

FUSES.—Fuses are 20 ampere.

Plate No. 47

OVERLAND "LIGHT FOUR" AND "COUNTRY CLUB" AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM CONNECTICUT IGNITION

BATTERY.—Battery is 6 volt, 75 ampere-hour. The negative (—) terminal is grounded at starting motor.

IGNITION.—Breaker contacts separate .016 to .020 inch. They are made of tungsten. When the condition of the points affects the ignition, renew the inner breaker mechanism. For temporary service, resurface contacts with fine emery cloth.

OILING.—Refill the cup under the breaker head with pure vaseline and turn down every month. If car is driven more than 1000 miles in a month, this must be done every 1000 miles. Do not put grease or oil in the cup.

TIMING.—Breaker contacts begin to separate when the mark "1-4 U-P" on flywheel is 1¼ inches past indicator, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 3, 4, 2.

SPARK PLUG GAPS.—Spark plug gaps are .023 inch.

RENEWING BREAKER.—To renew breaker mechanism, remove wire leading from breaker to coil terminal marked "C." Unclasp and remove distributor head. Lift off the distributor rotor. Remove the two ring retaining screws which hold the breaker mechanism in place. Then remove breaker by pulling upward. Remove the primary wire attached to breaker and keep it to be installed on the new breaker. To install new breaker, reverse above operations.

STARTER.—Starter is connected to engine through a Bendix drive.

OILING.—Clean out and repack starter bearings with soft cup grease every 6 months.

GENERATOR.—Model GH. Generator current regulation is by third brush system.

Amperes	Generator Data	R.P.M.

BATTERY.—Battery is 6 volt, 100 ampere-hour. The negative (—) terminal is grounded at the starting motor.

IGNITION.—Magneto breaker contacts separate .018 to .020 inch. When condition of contacts affects ignition, resurface with a fine flat jeweler's file or worn No. 00 sandpaper.

OILING.—Refill magneto oil wells with light machine oil every month. If car is driven more than 500 miles in a month, oiling must be done every 500 miles.

TIMING.—Breaker contacts begin to separate when the mark "1-4 U.P." on flywheel is $1 \frac{3}{16}$ inches past indicator, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 3, 4, 2.

SPARK PLUG GAPS.—Spark plug gaps are .018 to .022 inch.

STARTER.—Model MC. Starter is connected to engine through a Bendix drive.

Starter Data

Torque	R.P.M.	Amperes
1 lb. ft.	2650	100
2 lb. ft.	1900	145-150
3 lb. ft.	1600	185-190
4 lb. ft.	1400	225
5 lb. ft.	1250	250-255
6 lb. ft.	1000	290-300

Lock torque is 16 lb. ft., current being 450-460 amperes at 3.8 to 4.2 volts.

OILING.—Clean out and repack starter bearings with soft cup or ball bearing grease every 6 months.

GENERATOR.—Model GD. Generator current regulation is by reverse series field.

Amperes	Generator Data	R.P.M.
5.0	-----	800-1000
10.0	-----	1350-1575
12.5	-----	1700-2050
15.0	-----	2250-3300
15.0-18	-----	3300-3700

A variation of 1.5 amperes from these amounts is allowable. Generator current may be varied slightly by adjusting brush pressure on commutator. The correct pressure is 1 to $1 \frac{1}{4}$ lbs. Operating freely as a motor, generator takes 1.75 amperes, armature revolving at 450 R.P.M. Shunt field current is .8 ampere.

OILING.—Put 5 or 6 drops of light engine oil in each of generator bearing oilers every two weeks. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.

RELAY.—Relay closes at 7-10 miles per hour or 575-650 R.P.M. of armature and opens at 5-7 miles per hour or 500-575 R.P.M. of armature. Charging current is .5 to 1.5 amperes at closing and the discharge current 0 to 1 ampere at opening of relay. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 16 cp. Dash and tail lamps are in series. They are each 3-4 volt, 2 cp.

FUSES.—Fuses are 20 ampere.

MODELS 36, 36R, 37 (1916-17)
LEECE-NEVILLE GENERATING, STARTING AND LIGHTING SYSTEM
REMY IGNITION

BATTERY.—Battery is 6 volt, 115 ampere-hour. The two-wire system is used.
IGNITION.—Breaker contacts separate .020 to .025 inch. When the condition of the points affects the ignition, resurface with a fine flat jewelers' file or worn No. 00 sandpaper.

OILING.—Refill the cup under the distributor head with soft cup grease and turn down two turns every two weeks. Put a small amount of vaseline on the fiber bumper of the contact arm, using a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when the second line past the top dead center, mark "1 and 6" on the flywheel is at the indicator, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 4, 2, 6, 3, 5.

SPARK PLUG GAPS.—Spark plug gaps are .020 to .025 inch.

STARTER.—Starter is connected to engine through a Bendix drive. Starter cranks the engine at 125 to 150 R.P.M. Current flow during cranking operation is 200 amperes, although as high as 550 amperes may be reached when first starting to turn engine over.

OILING.—Put several drops of light engine oil in starter bearing oilers every month.

GENERATOR.—Generator current regulation is by third brush system. Third brush is moved by turning the nut on front head of generator, with a pair of pliers. Maximum charging rate is 16 amperes, reached at 18-20 miles per hour.

TESTING GENERATOR.—To test for a short in the shunt field circuit, remove the third brush from its holder and connect it to the negative (—) terminal of a 6 volt storage battery. Then connect the positive (+) terminal of the battery to the positive (+) terminal of an ammeter and connect the negative terminal of the ammeter to the screw at the end of the fuse clip. Four amperes should flow. A greater current indicates damp, grounded or short circuited field coils.

OILING.—Put 5 or 6 drops of light engine oil in each of generator oilers every two weeks. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.

RELAY.—Relay closes at 7-9 and opens at 5-7 miles per hour. Clean relay contacts by drawing a piece of unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 18 cp. Dash lamp is 6-8 volt, 2 cp. Tail lamp is 6-8 volt, 2 cp.

FUSE.—Fuse on relay base is 5 ampere.

CIRCUIT BREAKER.—There is a locking type circuit breaker to take the place of fuses in the lighting circuits. It takes 25 amperes to open this device.

Model K (1915) (Serial Nos. 52001-60000)

Westinghouse Generating, Starting and Lighting System Atwater Kent Ignition

Battery.—Battery is 12 volt, 50 ampere-hour. The positive (+) terminal is grounded.

Ignition.—Breaker contacts separate .010 to .012 inch. They are made of tungsten. When the condition of the points affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

Oiling.—Put a drop of light machine oil on each of the rubbing parts of breaker and put 4 or 5 drops of light machine oil in the oil hole beside the notched shaft, every two weeks. Put a very small amount of vaseline on the notched shaft, applying with a toothpick. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Timing.—Breaker contacts separate when mark "1-4 CL" on flywheel is two inches past indicator, spark control in the fully retarded position. Spark control is entirely automatic or combined automatic and manual.

Firing Order.—The firing order is 1, 2, 4, 3.

Spark Plug Gaps.—Spark plug gaps are .027 to .031 inch.

Starter-Generator.—Frame No. 600. Starter and generator are combined into one unit. Armature is permanently chain connected to engine crank shaft.

Generator.—Generator current regulation is by third brush system. Generator begins to supply current at 9 miles per hour. Maximum charging current of 7-10 amperes is reached at 20-25 miles per hour.

Oiling.—Put several drops of light engine oil in each of starter-generator bearing oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Lamps.—Head lamps are 12-16 volt, 15 cp. Dash lamp is 12-16 volt, 2 cp. Tail lamp is 12-16 volt, 4 cp.

Fuses.—Head lamp fuse is 15 ampere. Tail lamp fuse is 3 ampere. Spare circuit fuse is 15 ampere. Horn fuse is 15 ampere.

DIAGRAM OF CONNECTIONS
Westinghouse Motor and Generator System on the Hupmobile

Plate No. 53

HUPMOBILE

MODEL R (1917-18-19)

BIJUR GENERATING, STARTING AND LIGHTING SYSTEM ATWATER KENT IGNITION

BATTERY.—Battery is 6 volt, 85 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Type CC. Breaker contacts separate .006 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING.—Every two weeks, remove the distributor head and put 4 or 5 drops of light engine oil in the oil hole exposed. Put a small amount of vaseline on the cam, applying with a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when the top dead center mark on the flywheel is 2 inches past the indicator, spark control lever and breaker assembly midway between the fully retarded and fully advanced positions.

FIRING ORDER.—The firing order is 1, 2, 4, 3.

SPARK PLUG GAPS.—Spark plug gaps are .022 inch.

STARTER.—Type FD-140, M-993 or M-1197. Starter is connected to the engine through a Bijur automatic pinion shift. Rotation is counter-clockwise, looking at commutator end.

OILING.—Put 5 or 6 drops of light engine oil in each of the starter oilers every month.

GENERATOR.—Type P-210, M-863 or M-1196. Rotation is counter-clockwise, looking at commutator end. Generator current regulation is by third brush system. Maximum current output is 12-15 amperes, reached at 20-25 miles per hour or 1800 R.P.M. of the armature. Charging rate is varied by inserting a special toothed wrench in the adjusting hole in the commutator end plate and moving the third brush assembly through a ratchet engagement. Turn the wrench in a clockwise direction to increase the charging rate, and in a counter-clockwise direction to decrease the charging rate.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

TO REMOVE GENERATOR.—Remove the hexagonal-headed plug which extends from the front, right-hand, top side of the chain case, viewed from the front of the car. Then screw a $\frac{3}{8}$ by 16 U.S.S. bolt or cap screw into the hole until it bears firmly against the chain in order to prevent any movement of the chain or cam shaft gear. Next remove the circular cover plate at rear of generator on the front side of the chain case. The bolts holding this plate in place extend beyond the chain case and can be reached from above and removed without taking off the dust pan. Loosen the three bolts holding the generator to the crank case. Gently pull the generator away from the crank case but not far enough to allow the driving chain to slip off the pinion on the rear of the shaft. Then run a wire through the opening of the chain and over the top of the case to prevent the chain falling to the bottom of the case. Generator may then be removed. Make sure that the set screw is removed and the plug replaced after the generator is again installed.

RELAY.—Relay closes at 8-10 and opens at 6-8 miles per hour. To adjust relay connect a voltmeter across the main brushes of the generator, and slowly speed up the engine. Insert the special socket wrench in the adjusting hole in the top of the relay cover and vary the spring tension until the relay closes when the voltmeter indicates 6.5 volts. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 15 cp. Dash and tail lamps are 6-8 volt, 2 cp.

FUSES.—Lighting circuit fuses are 10 ampere. Generator fuse is 10 ampere.

WESTINGHOUSE STARTING + LIGHTING SYSTEM
ATWATER KENT IGNITION

Plate No. 54

HUPMOBILE

SERIES N (1916). (SERIAL NOS. 60,001 TO 75,000)

WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM ATWATER KENT IGNITION

BATTERY.—Battery is 6 volt, 100 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Type K2. Breaker contacts separate .010 to .012 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING.—Put a drop of light engine oil on each of the wearing parts of the breaker and 4 or 5 drops in the oil hole beside the notched shaft every two weeks. Apply a small amount of vaseline to the cam with a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts separate when the top dead center mark on the flywheel is 2 inches past the indicator, spark control lever and breaker assembly midway between the fully retarded and fully advanced positions.

FIRING ORDER.—The firing order is 1, 2, 4, 3.

SPARK PLUG GAPS.—Spark plug gaps are .022 inch.

STARTER.—Frame 700. Starter is connected to the flywheel through a pinion shifted by the operator. Lock torque is 12.5 pound-feet, current being 400 amperes. Torque at 1200 R.P.M. is 2.5 pound-feet.

OILING.—Put 5 or 6 drops of light engine oil in each of the starter oilers every month.

GENERATOR.—Frame 400-R. Generator voltage regulation is by vibrating regulator. Maximum charging rate is 16-20 amperes, decreasing to 5-6 amperes as battery becomes fully charged.

Generator Data

Battery Charging Current Without Lamp Load			Battery Charging Current With 7 Ampere Lamp Load		
Amperes	Volts	M.P.H.	Amperes	Volts	M.P.H.
2	6.5	10	0	6.3	12.5
8	6.5	15	4	6.5	15.0
12	7.0	20	6	6.6	20.0
12	7.0	25	7	6.7	25.0

Above tests are obtained with the generator charging a battery of 1.250 solution. The difference between the voltage of the generator at 1200 R.P.M. with a 15 ampere load and at 1200 R.P.M. with no load must not be less than .7 volt or greater than 1 volt. If a greater variation is obtained the regulator air gaps are incorrect or clogged.

OILING.—Put 4 or 5 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY-REGULATOR.—Relay and regulator are combined into one unit. Relay closes at 8-10 miles per hour or 575 R.P.M. of the armature and opens at 7-9 miles per hour or 500-525 R.P.M. of the armature. The charging current is .5 to 1 ampere at closing and the discharge current is 1-3 amperes at the opening of relay contacts. Air gap between relay armature (moving member) and coil core is .055 to .060 inch. Air gap between regulator armature and coil core is .045 to .055 inch. Adjust relay by bending the two prongs at the end of the moving member. Adjust regulator by turning thumb screw. Regulator must be adjusted to give the results specified above under "Generator". Clean relay and regulator contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 15 cp. Dash and tail lamps are 6-8 volt, 2 cp.

FUSES.—Fuses are 10 ampere.

Plate No. 55

HUPMOBILE

SERIES N (1916) SERIAL NOS. 60,001 TO 75,000

BLJUR GENERATING, STARTING AND LIGHTING SYSTEM

ATWATER-KENT IGNITION

BATTERY.—Battery is 6 volt, 100 ampere-hour. The positive (+) terminal is grounded at the starting switch.

IGNITION.—Breaker contacts separate .010 to .012 inch. They are made of tungsten. When the condition of the points affects the ignition remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING.—Put a drop of light machine oil on each of wearing parts of breaker and 4 or 5 drops in oil hole beside notched shaft every 2 weeks. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.

TIMING.—Breaker contacts separate when the top dead center mark on flywheel is 2 inches past indicator, spark control advanced one-half.

FIRING ORDER.—The firing order is 1, 2, 4, 3.

STARTER.—Type E 68, M 250. Anti-clockwise rotation, commutator end. Starter is connected to engine through a pinion shifted by operator.

OILING.—Put several drops of light engine oil in starter bearing oilers every month.

GENERATOR.—Type L 61, M 251. Anti-clockwise rotation, commutator end. Generator regulation is by third brush system. Maximum generator output is 12-16 amperes, reached at 20-25 miles per hour, or 1200-1600 R.P.M. of armature. Output may be varied by shifting third brush. Third brush is secured to generator by two stud bolts, the nuts of which appear in a recess in the front head of generator. Loosen these nuts with a socket wrench and shift the brush by gently tapping the shank of the wrench. Shifting brush in the direction of armature rotation will increase the output. Shifting brush in the opposite direction will decrease the output. Shifting the brush 1/16 inch will vary the output from 2 to 3 amperes. Tighten nuts after adjusting brush. Brush adjustment should be made to give the desired rate with generator hot and charging a 3 cell battery of 1.250 solution or higher. There is a 10 ampere fuse in the small aluminum cap on generator housing to protect generator windings, should excessively high resistance occur in the charging circuit. Pressure of brushes on commutator is 14 ounces.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. Refill grease cup on end of fan shaft with soft cup grease and turn down at the same time. If car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

RELAY.—Relay closes at 600-650 R.P.M. of armature or 8-9 miles per hour and opens at 550-600 R.P.M. or 6-7 miles per hour. Charging current is 1-3 amperes at closing and the discharge current 0-1 ampere at opening of relay. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service. Relay contacts separate .045 inch. Air gap between relay armature (moving member) and coil core is .035 inch.

LAMPS.—Head lamps are 6-8 volt, 15 cp. Dash lamp is 6-8 volt, 2 cp. Tail lamp is 6-8 volt, 2 cp.

FUSES.—Fuses are 10 ampere.

HAYNES
MODELS 40, 40R, 41 AND 44 (1917-18)
LEECE-NEVILLE GENERATING, STARTING AND LIGHTING SYSTEM
DELCO IGNITION

BATTERY.—Battery is 6 volt, 115 ampere-hour. The two-wire system is used.

IGNITION.—Breaker contacts separate .020 to .025 inch. When the condition of the points affects the ignition, resurface with a fine flat jeweler's file or worn No. 00 sandpaper.

OILING.—Refill the cup under the distributor head with soft cup grease and turn down two turns every two weeks. Put a small amount of vaseline on the fiber bumper of the contact arm, using a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when the top dead center mark on flywheel is $\frac{1}{2}$ inch past indicator, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1R, 6L, 4R, 3L, 2R, 5L, 6R, 1L, 3R, 4L, 5R, 2L.

SPARK PLUG GAPS.—Spark plug gaps are .025 to .030 inch.

STARTER.—Starter is connected to engine through a Bendix drive. Starter cranks engine at 125 to 150 R.P.M. Current during cranking operation is 200 amperes, but current may reach 550 amperes when first starting to turn the engine over.

OILING.—Put 4 or 5 drops of light engine oil in each of starter oilers every month.

GENERATOR.—Generator current regulation is by third brush system. Third brush is moved by turning the nut on front head of generator with a pair of pliers. Maximum charging rate is 16 amperes, reached at 18-20 miles per hour.

TESTING GENERATOR.—To test for a short in the shunt field circuit, remove the third brush from its holder and connect it to the negative (—) terminal of a 6 volt storage battery. Then connect the positive (+) terminal of the battery to the positive (+) terminal of an ammeter and connect the negative (—) terminal of the ammeter to the screw at the end of the fuse clip. Four amperes should flow. A greater current indicates damp, grounded or short circuited field coils.

OILING.—Put 5 or 6 drops of light engine oil in each of generator oilers every two weeks. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.

RELAY.—Relay closes at 7-9 and opens at 5-7 miles per hour. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 18 cp. Small head lamps are 6-8 volt, 12 cp. Dash lamp is 6-8 volt, 2 cp. Tail lamp is 6-8 volt, 2 cp.

FUSES.—Generator fuse is 5 ampere.

CIRCUIT BREAKER.—There is a locking type circuit breaker to take the place of fuses in the lighting, horn and ignition circuits. It takes 25 amperes to open this device.

Plate No. 56

Paige-Detroit

Model 6-51 (1917)

Remy Generating, Starting and Lighting System

Remy Ignition

Battery.—Battery is 6 volt, 110 ampere-hour. The negative (—) terminal is grounded.

Ignition.—Breaker contacts should separate .020 to .025 inch. If burned or pitted, affecting the ignition, resurface them with a very fine, flat jeweler's file or a strip of worn No. 00 sand paper.

Timing.—Breaker contacts should separate when flywheel marking "DC 1-6" is $1\frac{1}{4}$ inches past the indicator, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1 5, 3, 6, 2, 4.

Spark Plug Gaps.—Spark plug gaps should be .030 to .032 inch.

Oiling.—Refill the cup under the distributor head with soft cup grease and turn down two turns every two weeks. At the same time put a small amount of vaseline on the fiber bumper of the contact arm, using a toothpick. If the car is driven more than 500 miles in two weeks, these attentions should be given every 500 miles.

Starter.—Starter is connected to the engine by a Bendix drive.

STARTER DATA, No. 298-A

Torque	R. P. M.	Amperes	Volts
0 lb. ft.	3850	45	6.0
1 lb. ft.	1800	95	5.7
4 lb. ft.	1070	195	5.0
7 lb. ft.	660	290	4.6
9 lb. ft.	475	350	4.4
12 lb. ft.	250	425	3.9
15-17 lb. ft.	Lock	500	3.6

Oiling.—Put 5 or 6 drops of light engine oil in starter bearings every month.

Generator.—Generator current regulation is by third brush method. A thermostat located in the brush rigging of the generator cuts in a resistance at a temperature of 175° F., reducing the maximum charging rate 6 amperes. Resistance also acts as a shunt field fuse. The thermostat is intended to change the charging rate as demand of seasons or car operation requires. Never touch the thermostat points.

GENERATOR DATA, No. 257-A

Amperes	R. P. M.	Volts
0	375- 410	6.4
1	405- 415	6.8
5	420- 570	7.2
10	650- 720	7.6
16	850- 870	8.1
19.5-20.5	1200-1500	8.2
16.2-19.2	2000	8.2
9.3-11.7	3000	7.7

Above tests made with relay in circuit and thermostat points closed, but without ignition. Operating freely as a motor, generator runs at 250 R. P. M., drawing 4.5 amperes at 5.9 volts. Shunt field takes 3.5 amperes at 6.85 volts.

Oiling.—Put 5 or 6 drops of light engine oil in generator bearing oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Relay.—Relay should close at 6-8 miles per hour and open at 5-7 miles per hour. Gap between relay contacts should be .012 to .015 inch. Air gap between relay armature (moving member) and coil core should be .012 to .015 inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sand paper. Remove all grit. Adjust before again putting into service.

Lamps.—Head lamps are 6-8 volt, 17 cp. Dimmer lamps are 6-8 volt, 5 cp. Dash and tail lamps are 6-8 volt, 2 cp.

Fuses.—Fuses are 20 ampere.

Model Numbers.—Generator is No. 257-A. Starter is No. 298-A. Ignition coil is No. 285-B. Ignition switch is No. 192-A.

Paige-Detroit, Model 6-51 (1917), Remy System

EISEMANN MAGNETO IGNITION

HAYNES
MODELS 26, 27, 28 (1914)
LEECE-NEVILLE STARTING AND LIGHTING SYSTEM
EISEMANN MAGNETO IGNITION

Plate No. 58

BATTERY.—Battery is 12 volt, 70 ampere-hour. The two-wire system is used.

IGNITION.—Magnetto breaker contacts separate .016 to .020 inch. When the condition of the points affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Put several drops of light machine oil in each of magnetto bearing oilers every month. If car is driven more than 1000 miles in a month, oiling must be done every 1000 miles.

TIMING.—Breaker contacts begin to separate when the top dead center mark on flywheel is $\frac{1}{2}$ inch past indicator, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order of the 4 cylinder cars is 1, 3, 4, 2. The firing order of the six cylinder cars is 1, 4, 2, 6, 3, 5.

SPARK PLUG GAPS.—Spark plug gaps are .016 to .020 inch.

STARTER.—Starter is connected to engine through a set of gears meshed by operator.

OILING.—Put several drops of light engine oil in each of starter oilers every month.

GENERATOR.—Generator current regulation is by reverse series field. Generator current is 12 amperes at 13 volts, reached at 800 R.P.M. of armature or 15-20 miles per hour.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY-INDICATOR.—Cutout relay has two sets of contacts. When contacts are closed, the indicator shows "Charge". When contacts are separated, indicator shows "Off". Relay closes at 6-8 miles per hour or 430 R.P.M. of armature, and opens at 5-6 miles per hour, or 350 R.P.M. of armature. See that rod carrying movable contact moves freely in its holder at all times. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Side lamps are 6-8 volt, 4-6 cp. Dash lamp is 6-8 volt, 2 cp. Tail lamp is 6-8 volt, 2 cp.

Plate No. 59

ROSS

MODEL 8 (1916-17)

ROBBINS & MYERS GENERATING, STARTING AND LIGHTING SYSTEM ATWATER-KENT IGNITION

BATTERY.—Willard, Type SC-305, 6 volt, 150 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Type K-2. Breaker contacts separate .010 to .012 inch. They are made of tungsten. When the condition of the points affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING.—Put a drop of light machine oil on each of the wearing parts of the breaker and 4 or 5 drops in the oil hole beside the notched shaft every two weeks. Put a small amount of vaseline on the notched shaft, applying with a toothpick. If car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts separate when piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1R, 1L, 3R, 3L, 4R, 4L, 2R, 2L.

SPARK PLUG GAPS.—Spark plug gaps are .030 inch.

STARTER.—Starter is connected to the engine through a Bendix drive. Starter cranks the engine at 70 R.P.M., current 450 amperes. Operating freely, armature revolves at 2500 R.P.M., current 80 amperes. Tension of brushes on commutator is 1/2 pound.

OILING.—Clean out and repack starter bearings with soft cup grease every six months.

GENERATOR.—Generator current regulation is by vibrating regulator. Maximum current output is 10 amperes, reached at 10 miles per hour. Operating freely as a motor, generator armature revolves at 125 R.P.M., current 10 amperes at 6 volts. Shunt field current is 2.5 amperes. Brush tension is 6 ounces.

OILING.—Clean out and repack generator bearings with soft cup grease every three months.

RELAY-REGULATOR.—Ward-Leonard. Relay closes at 8-9 miles per hour, or 475 R.P.M. of armature, and opens at 7-8 miles per hour or 450 R.P.M. of armature. Relay and regulator contacts separate .015 inch. Clean relay and regulator contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 24 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp.

Plate No. 60

OLYMPIAN MODEL 45 (1919)

DYNETO GENERATING, STARTING AND LIGHTING SYSTEM CONNECTICUT IGNITION

BATTERY.—Battery is 6 volt, 80 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Breaker contacts separate .020 inch. They are made of tungsten. When the condition of the contacts affects the ignition, renew the inner breaker mechanism. For temporary service, resurface contacts with fine emery cloth.

OILING.—Refill the grease cup under the breaker head with pure vaseline and turn down every month. If the car is driven more than 1000 miles in a month, this must be done every 1000 miles. Do not put grease or oil in the cup.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 2, 4, 3.

SPARK PLUG GAPS.—Spark plug gaps are .025 to .030 inch.

STARTER.—Model D-162. Starter is connected to the engine through a Bendix drive. When cranking engine, starter takes 130 amperes, armature revolving at 1500 R.P.M.

Starter Data			
Torque	R.P.M.	Amperes	Volts
0.0 lb. ft.	5600	25	6.4
2.5 lb. ft.	1400	150	5.8
5.0 lb. ft.	850	250	5.3
10.0 lb. ft.	250	420	4.6
14.0 lb. ft.	Lock	530	4.0

OILING.—Put several drops of light engine oil in starter oilers every month.

GENERATOR.—Model C-162. Generator current regulation is by the third brush system. Maximum current output is 12-15 amperes, reached at 1200 R.P.M. of the armature or 20-25 miles per hour.

Generator Data					
Amperes	Cold Test	R.P.M.	Amperes	Hot Test	R.P.M.
6		600	5		600
13		900	10		900
15		1200	12		1200
13.5		1600	11.5		1600
11.5		2000	10		2000

Shunt field current is 3.5 amperes at 6.5 volts. Charging rate is varied by adjustment of the third brush setting. Remove the leather plug in the commutator end of the generator, loosen the screw exposed and move in the direction of armature rotation to increase the charging rate. Move in the opposite direction to decrease the charging rate. Tighten the adjusting screw and replace the leather plug after adjustment is made.

OILING.—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 8-10 miles per hour or 450-500 R.P.M. of armature, and opens at 6-8 miles per hour or 400-450 R.P.M. of armature. Relay contacts separate 3/32 inch. Air gap between relay armature and coil core is 1/8 inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 15 cp. Dash and tail lamps are 6-8 v lt. 2 cp.

Hudson

Mod 1 6-40 (1916) (Serial Nos. G-10001 to G-40000)

Delco Generating, Starting and Lighting System

Delco Ignition

1916—"40" WIRING DIAGRAM

Plate No. 62

Battery.—Battery is 6 volt, 100 ampere-hour. The negative (—) terminal is grounded.

Ignition.—Breaker contacts separate .010 inch. When contacts are closed contact blade and clip separate .015 inch. See that pigtail conducting current to the contact blade is not disconnected. When the condition of the points affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sand paper.

Oiling.—Put several drops of light engine oil in upper ball bearing every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Timing.—Breaker contacts begin to separate when the line "A" on the flywheel is at the indicator, spark control lever and breaker assembly in the fully advanced position.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—Spark plug gaps are .027 to .030 inch.

Starter-Generator.—Starter and generator are combined into one unit, but are electrically separate. Starter is connected to the engine through a set of reduction gears meshed by the operator. Two overrunning clutches are provided. In connection with the ignition switch, a circuit is closed allowing a current to flow through the generator windings, causing the armature to revolve slowly, aiding the meshing of the reduction gears. One clutch permits this rotation, and also permits a relatively high speed of the armature, necessary when operating as a starter. The second overrunning clutch prevents the engine from driving the armature through the reduction gears. Depressing the starting pedal meshes the reduction gears, opens the generator circuit and allows the motor brush to come in contact with the commutator, closing the starter circuit and cranking the engine. When the pedal is released, a spring reverses these operations.

Generator.—Generator voltage regulation is by automatic field rheostat, operated from a governor on the distributor shaft.

GENERATOR DATA, MOTOR-GENERATOR No. 66

Amperes	R. P. M.
Neutral	350
5-11	500
16-20	900-1050
15	1125
9-14.5	1500

Charging rate is varied by changing regulating resistance spool. There are six different spools available namely, Nos. 633, 703, 702, 701, 817 and 955. No. 633 is wound with the largest wire, the sizes reducing in the order named. Installing a spool of larger wire increases the output. The spools have a wide brass cap at one end and a narrow cap at the other end. Minimum output with each spool is obtained when installed with the narrow cap at the bottom. The contact arm must bear on the resistance spool with a pressure of 6 ounces. A poor contact between the arm and spool will cause the generator to motor at excessive speed when the ignition switch is closed.

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Relay.—There is no relay. The circuit between the generator and the battery is controlled by the ignition switch. The overrunning clutch at driving end allows generator to operate as a motor when battery's pressure is above that of generator. If the engine is killed when stopping, the noise made by the clutch serves to attract the operator's attention to open the ignition switch. The opening and closing of the generator-battery circuit by the operator takes the place of the relay.

Lamps.—Head lamps are 6-8 volt, 17 cp. Dash and tail lamps are in series and are each 3-4 volt, 2 cp.

Circuit Breaker.—There is a vibrating circuit breaker on the back of the lighting switch which takes the place of fuses in the lighting circuits. It requires a current of 25 amperes to start this device vibrating, but when vibrating 3 to 5 amperes will cause it to continue.

Model Numbers.—Motor-generator is No. 66. Ignition coil is No. 2116. Combination switch is No. 1055.

Plate No. 63

Models 4-38 and 6-40 (1915)

Delco Generating, Starting and Lighting System

Delco Ignition

Battery.—Battery is 6 volt, 100 ampere-hour. The negative (—) terminal is grounded.

Ignition.—Breaker contacts separate .010 inch. When contacts are closed, contact blade and clip separate .015 inch. See that pigtail conducting current to the contact blade is not disconnected. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sand paper.

Timing.—Contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order of Model 4-38 is 1, 3, 4, 2. The firing order of Model 6-40 is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—Spark plug gaps are .027 inch.

Oiling.—Put 4 or 5 drops of light engine oil in distributor bearing oiler every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Starter.—Starter is connected to engine through a set of gears meshed by the operator.

Generator.—Generator voltage regulation is by automatic field rheostat, operated from the distributor shaft. Charging rate is varied by changing the regulating resistance spool. There are six different spools available, namely, Nos. 633, 703, 702, 701, 817 and 955. No. 633 is wound with the largest wire, the size reducing in the order named. Installing a spool with larger wire increases the charging rate. The spools have a wide brass cap at one end and a narrow cap at the other end. Minimum charging rate with each spool is obtained by installing with narrow cap at the bottom. The contact arm must bear on the resistance spool with a pressure of 6 ounces. A poor contact between contact arm and spool causes the generator to run at excessive speed when ignition switch is closed.

Model 57		GENERATOR DATA		Model 58	
Amperes	R. P. M.	Amperes	R. P. M.	Amperes	R. P. M.
Neutral	350	Neutral	510

Delco Ignition

Battery.—Battery is 6 volt, 100 ampere-hour. The negative (—) terminal is grounded.

Ignition.—Breaker contacts separate .018 inch. They are made of tungsten. When the condition of the points affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

Timing.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—Spark plug gaps are .027 to .030 inch.

Oiling.—Put 4 or 5 drops of light engine oil in timer bearing oilers every two weeks. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.

Starter.—Starter is Model No. 106. Starter is connected to the engine through a Bendix drive. Lock torque is 10 pound-feet. Running freely, starter takes 40 amperes.

Oiling.—Put several drops of light engine oil in starter bearings every month.

Generator.—Generator current regulation is by third brush system. Generator begins to supply current at 8-10 miles per hour, or 500-550 R. P. M. of armature. Maximum charging rate is 15-18 amperes, reached at 22 miles per hour.

GENERATOR DATA, MODEL No. 105

Hot Test		Cold Test

Battery.—Battery is 6 volt, 120 ampere-hour. The negative (—) terminal is grounded.

Ignition.—Breaker contacts separate .010 inch. When contacts are closed, contact blade and clip separate .015 inch. See that pigtail conducting current to the contact blade is not disconnected. When the condition of the points affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sand paper.

Oiling.—Put several drops of light engine oil in distributor shaft bearing every two weeks. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.

Timing.—Breaker contacts begin to separate when top dead center mark on flywheel is $1\frac{3}{4}$ inches past indicator, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—Spark plug gaps are .027 to .030 inch.

Starter-Generator.—Starter and generator are combined into one unit, but are electrically separate. Starter is connected to the engine through a set of reduction gears meshed by the operator.

Generator.—Generator voltage regulation is by automatic field rheostat operated from a governor on the distributor shaft. Generator begins to supply current at 7.9 miles per hour or 350-400 R. P. M. of armature. Maximum charging current of 16-18 amperes is reached at 20-25 miles per hour.

GENERATOR DATA, MOTOR-GENERATOR No. 59 or 64

Amperes	R. P. M.
Neutral	350
6-11	500
16-20	910-1050
9-14.5	1500

Operating freely as a motor, clutch at driving end the only retarding force, generator takes 4.5 amperes. Charging rate is varied by changing the regulating resistance spool. There are six different spools available namely, Nos. 633, 703, 702, 701, 817 and 955. No. 633 is wound with the largest wire, the sizes reducing in the order named. Installing a spool of larger wire increases the output. The spools have a wide brass cap at one end and a narrow cap at the other end. Minimum output with each spool is obtained when installed with the narrow cap at the bottom. The contact arm must bear on the resistance spool with a pressure of 6 ounces. A poor contact between the arm and spool will cause the generator to motor at excessive speed when the ignition switch is closed.

Oiling.—Put 5 or 6 drops of light engine oil in each of generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles. Once a year remove the name plate and lubricate the spiral gears with soft cup grease. Limit the amount of grease, so that none can work through to the regulating resistance.

Relay.—There is no relay. The circuit between the generator and battery is controlled by the ignition switch. The overrunning clutch at driving end allows generator to operate as a motor when battery's pressure is above that of generator. If engine is killed when stopping, the noise made by the clutch serves to attract the operator's attention to open the ignition switch. The opening and closing of the generator-battery circuit by the operator takes the place of the relay.

Lamps.—Head lamps are 6-8 volt, 15 cp. Dash and tail lamps are each 6-8 volt, 2 cp.

Circuit-Breaker.—A vibrating circuit-breaker takes the place of fuses in the lighting circuits. It requires a current of 25 amperes to start this device vibrating, but when vibrating 3 to 5 amperes will cause it to continue.

Model-Numbers.—Motor-generator is Model No. 64. Ignition coil is Model No. 2111. Combination switch is Model No. 1048. Battery is Exide, 3-X-155-1.

Plate No. 66

Jeffery

CHESTERFIELD SIX (1915-16) BIJUR GENERATING, STARTING AND LIGHTING SYSTEM BOSCH MAGNETO IGNITION

BATTERY.—Battery is 6 volt, 100 ampere-hour. The positive (+) terminal is grounded by a wire leading from fuse and junction block.

IGNITION.—Magnetos breaker contacts separate .014 to .016 inch. When the condition of the points affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Put 2 or 3 drops of light engine oil in each of magneto bearing oilers every month. Put a very small amount of vaseline on fiber bumper of contact arm, applying with a toothpick. If car is driven more than 1000 miles in a month, these attentions must be given every 1000 miles.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 4, 2, 6, 3, 5.

SPARK PLUG GAPS.—Spark plug gaps are .016 to .020 inch.

STARTER.—Starter is connected to engine through a set of gears meshed by operator. When pedal is depressed part way, motor is connected to battery through a resistance, causing armature to revolve slowly, aiding meshing of gears. When gears are meshed, starter is connected directly to battery, causing it to crank engine.

OILING.—Put 4 or 5 drops of light engine oil in each of starter bearing oilers and 8-10 drops in hole on top of gear case, every month.

GENERATOR.—Type K-634, M-50. Rotation is counter-clockwise, looking at commutator end. Generator voltage regulation is by vibrating regulator. Maximum charging rate is 15-18 amperes, decreasing to 4-6 amperes as battery becomes charged. Maximum charging rate is reached at 20 miles per hour. Generator may be operated with battery disconnected, supplying current for lights, at speeds under 30 miles per hour.

OILING.—Put 5 or 6 drops of light engine oil in each of generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY-REGULATOR.—Relay and regulator are mounted on top of generator. There are 3 sockets on generator into which the 3 split plugs of the regulator are inserted. Relay and regulator adjustments are made through two holes in top cover, which are closed by brass plugs, lead seals, or both. To adjust relay, disconnect one battery terminal, turn the head lamps "On", and connect a voltmeter across the generator brushes. Then slowly speed up the engine, and by means of a small socket wrench inserted in the hole in regulator cover nearest the disconnecting plug, adjust the spring tension of relay until the contacts close when the voltmeter indicates 6.5 volts. The closing will be indicated by the lighting of the head lamps. To adjust the regulator, drive the generator at 1000-1400 R.P.M., charging a battery of 1250 specific gravity or higher. Insert the socket wrench in the other hole and adjust regulator spring tension until the voltmeter connected across generator brushes, indicates 7.75 volts. This voltage must be maintained at all higher speeds. Clean relay and regulator contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 000 sandpaper. Remove all grit. Adjust before again putting into service. Every two weeks or 500 miles of travel reverse the regulator disconnecting plug by pushing it in, turning through 180° until it springs forward and locks on the opposite side of the disconnecting position.

LAMPS.—Head lamps are 6-8 volt, 17 cp. Dimmer lamps are 6-8 volt, 5 cp. Dash lamp is 6-8 volt, 2 cp. Tail lamp is 6-8 volt, 2 cp. Dash lamp has double contact base. All ther lamps have single contact base.

Internal circuits are shown on Page 10.

Plate No. 67

HUPMOBILE

SERIES N (1917) SERIAL NOS. 75,001 TO 87,519
WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM
ATWATER KENT IGNITION

BATTERY.—Battery is 6 volt, 100 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Type K2. Breaker contacts separate .010 to .012 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING.—Put a drop of light engine oil on each of the wearing parts of the breaker and 4 or 5 drops in the oil hole beside the notched shaft every two weeks. Apply a small amount of vaseline to the cam, with a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts separate when the top dead center mark on the flywheel is 2 inches past the indicator, spark control lever and breaker assembly midway between the fully retarded and fully advanced positions.

FIRING ORDER.—The firing order is 1, 2, 4, 3.

SPARK PLUG GAPS.—Spark plug gaps are .022 inch.

STARTER.—Frame 700. Starter is connected to the flywheel through a pinion shifted by the operator. Lock torque is 12.5 pound-feet, current being 400 amperes. Torque at 1200 R.P.M. is 2.5 pound-feet.

OILING.—Put 5 or 6 drops of light engine oil in each of the starter oilers every month.

GENERATOR.—Frame 400-R. Generator voltage regulation is by vibrating regulator. Maximum charging rate is 16-20 amperes, decreasing to 5-6 amperes as battery becomes fully charged.

Generator Data

Battery Charging Current without Lamp Load			Battery Charging Current with 7 ampere lamp load		
Amperes	Volts	M.P.H.	Amperes	Volts	M.P.H.
2	6.5	10	0	6.3	12.5
8	6.5	15	4	6.5	15.0
12	7.0	20	6	6.6	20.0
12	7.0	25	7	6.7	25.0

Above tests are obtained with the generator charging a battery of 1.250 solution. The difference between the voltage of the generator at 1200 R.P.M. with a 15 ampere load, and at 1200 R.P.M. with no load, must be not less than .7 volt or greater than 1 volt. If a greater variation is obtained the regulator air gaps are incorrect or clogged.

OILING.—Put 4 or 5 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY-REGULATOR.—Relay and regulator are combined into one unit. Relay closes at 8-10 miles per hour or 575 R.P.M. of the armature and opens at 7-9 miles per hour or 500-525 R.P.M. of the armature. The charging current is .5 to 1 ampere at closing and the discharge current is 1-3 amperes at the opening of relay contacts. Air gap between relay armature (moving member) and coil core is .055 to .060 inch. Air gap between regulator armature and coil core is .045 to .055 inch. Adjust relay by bending the two prongs at the end of the moving member. Adjust regulator by turning thumb screw. Regulator must be adjusted to give the results specified above under "Generator". Clean relay and regulator contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 15 cp. Dash and tail lamps are 6-8 volt, 2 cp.

FUSES.—Fuses are 10 ampere.

Battery.—Battery is 6 volt, 100 ampere-hour. The negative (—) terminal is grounded.

Ignition.—Breaker contacts separate .018 inch. They are made of tungsten. When the condition of the points affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

Timing.—Breaker contacts begin to separate when the top dead center mark on flywheel is $1\frac{1}{2}$ inches past indicator, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—Spark plug gaps are .027 to .030 inch.

Oiling.—Put 4 or 5 drops of light engine oil in oiler at side of distributor housing every two weeks. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.

Starter-Generator.—Starter is connected to engine through a set of reduction gears meshed by operator. Two overrunning clutches are provided. In connection with the ignition switch a circuit is closed allowing current to flow through the generator windings, causing the armature to revolve slowly, aiding the meshing of the reduction gears. One clutch permits this rotation, and also permits a relatively high speed of the armature, necessary when operating as a starter. The second overrunning clutch prevents the engine driving the armature through the reduction gears. Depressing the starting pedal meshes the reduction gears, opens the generator circuit and allows the motor brush to come in contact with the commutator, closing the starter circuit and cranking the engine. When the pedal is released, a spring reverses these operations.

Generator.—Generator current regulation is by third brush system. Generator begins to supply current at 7-9 miles per hour or 400-450 R. P. M. of armature. Maximum charging rate of 16-18 amperes is reached at 20-25 miles per hour.

GENERATOR DATA, MOTOR-GENERATOR NOS. 73, 83 AND 93

Amperes	R. P. M.
Neutral	400
6-10	600
16-20	1000
10-15	1500
9-13	1800

Oiling.—Put several drops of light engine oil in each of generator oilers every two weeks. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.

Lamps.—Head lamps are 6-8 volt, 15 cp. Dimmer lamps are 6-8 volt, 4 cp. Tonneau lamp is 6-8 volt, 4 cp. Dash and tail lamps are in series. They are each 3-4 volts, 2 cp.

Circuit Breaker.—There is a vibrating circuit breaker to take the place of fuses. It takes 25 amperes to start this device vibrating, but when vibrating 3 to 5 amperes will cause it to continue.

Model Numbers.—Motor-generator is Nos. 73, 83 or 93. Combination switch is No. 1057 or 1065. Ignition coil is Nos. 2120, 2124, 2125, 2140, 2141 or 2142.

BUICK

MODELS D-44, D-45, D-46, D-47, D-54 AND D-55 (1916)
(SERIAL NOS. 144,717 TO 254,501)
DELCO GENERATING, STARTING AND LIGHTING SYSTEM
DELCO IGNITION

BATTERY.—Battery is 6 volt, 85 ampere-hour on the D-44, 45, 46 and 47 models, and 6 volt, 100 ampere-hour on the D-54 and D-55 Models. The negative (—) terminal is grounded.

IGNITION.—Breaker contacts separate .018 inch. They are made of tungsten. When the condition of the points affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING.—Put 5 or 6 drops of light engine oil in the oil hole on side of distributor housing every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles. If the track of the distributor rotor button is not well polished, apply a very small amount of vaseline with a soft cloth.

TIMING.—Breaker contacts separate when engine is turned to the 7 degree mark on the flywheel, (approximately one inch after dead center,) with spark control lever and breaker assembly in fully retarded position.

FIRING ORDER.—The firing order is 1, 4, 2, 6, 3, 5.

SPARK PLUG GAPS.—Spark plug gaps are .028 inch to .030 inch.

STARTER GENERATOR.—Starter and generator are combined into one unit, but are electrically separate. Starter is connected to the engine through a set of reduction gears and a pinion shifted by the operator. Two overrunning clutches are provided. In connection with the ignition switch, a circuit is closed, allowing a current to flow through the generator windings, causing the armature to revolve slowly, facilitating the meshing of the reduction gears. One clutch permits this rotation, and also permits a relatively high speed of the armature, necessary when operating as a starter. The second overrunning clutch prevents the engine from driving the armature through the reduction gears. Depressing the starting pedal meshes the reduction gears, opens the generator circuit, and allows the motor brushes to come into contact with the commutator closing the starter circuit, and cranking the engine. When the pedal is released, a spring reverses these operation.

GENERATOR.—Generator current regulation is by third brush system. Motor-Generator No. 70 is used on the D-44, 45, 46 and 47 Models, and No. 69 is used on the D-54 and D-55 Mod

Generator Data.

Motor-Generator No. 70.		Motor-Generator No. 69.	
Amperes	R. P. M.	Amperes	R. P. M.
Neutral	600	Neutral	400
7.5- 8.5	825	9-10	740
12.0-15.0	1500	11-11.5	1000
11.5-14.5	1800	12-14.5	1400
		11-14.5	1800

Generator begins to supply current at 7-8 miles per hour and reaches its maximum output of 14-16 amperes at 20-25 miles per hour. Charging rate is changed by loosening the two screws in the third brush arm, and moving the brush in a clockwise direction (looking at commutator end), to increase the charging rate and in a counter clockwise direction to decrease the charging rate. Operating freely as a motor with the overrunning clutch as the only retarding force, generator draws 4.5 amperes.

(SERIAL NOS. 144,717 TO 254,501)
DELCO GENERATING, STARTING AND LIGHTING SYSTEM
DELCO IGNITION

Continued from preceding page.

GENERATOR—Continued.—To remove generator clutch loosen screw in end of armature shaft and remove lock washer and key washer. Insert armature in a hole in a horizontal bench or box. The hole should be $\frac{1}{4}$ inch larger than the armature. Allow the armature end frame to drop about 2 inches, being careful to have the end frame come squarely in contact with the bench. Hold armature from below so that it will not fall to the floor. Clutch is held together by retaining spring wire, which, when removed, allows the clutch to be disassembled for inspection. On the D-44, 45, 46 and 47 Models one of the generator brushes is raised during the cranking operation. On the D-54 and D-55 Models the generator circuit is opened by a switch when starting pedal is depressed.

OILING.—Put 5 or 6 drops of light engine oil in each of the starter-generator oilers every two weeks. At the same time turn down the grease cup two turns. If car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles. Renew the grease in distributor gear housing every six months.

RELAY.—There is no relay. The circuit between the generator and the battery is controlled by the ignition switch. The overrunning clutch at driving end allows generator to operate as a motor when battery's pressure is above that of generator. The noise made by the clutch serves to attract the operator's attention to open the switch. The opening and closing of the generator-battery circuit by the operator takes the place of the relay.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dimmer lamps are 6-8 volt, 4 cp. Tail and Dash lamps are each 6-8 volt, 2 cp.

CIRCUIT BREAKER.—There is a vibrator circuit breaker on the back of the lighting switch which takes the place of fuses in the lighting circuits. It requires a current of 25 amperes to start this device vibrating, but when vibrating, 3 to 5 volts will cause it to continue.

MODEL NUMBERS.—Motor-generator is No. 69 on the D-54 and 55 cars, and No. 70 on the D-44, 45, 46 and 47 cars. On both models the ignition coil is No. 2138. Combination switch is No. 1057 or 1066. Battery is Exide 2-X-C-13-1 on the D-44, 45, 46 and 47 cars, and Exide 3-X-C-15-1 on the D-54 and 55 cars.

Delco Ignition

Plate No. 74

Battery.—Battery is 6 volt, 100 ampere-hour. The negative (—) terminal is grounded.

Ignition.—Breaker contacts separate .010 to .012 inch. When the condition of the points affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sand paper. The copper pigtail must always be intact.

Oiling.—Put 5 or 6 drops of light engine oil in the upper ball bearing, accessible when distributor head and rotor are removed, every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles. If the track of the distributor rotor button is not well polished apply a small amount of vaseline with a soft cloth.

Timing.—Breaker contacts separate when piston entering power stroke in on top dead center, spark control lever midway between the fully advanced and fully retarded position. (First see that the breaker assembly is fully retarded when the control lever is in the fully retarded position.)

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plug Gaps.—Spark plug gaps are .028 to .030 inch.

Starter-Generator.—Starter and generator are combined into one unit, but are electrically separate. Starter is connected to the engine by a set of reduction gears and a pinion shifted by the operator. Two overrunning clutches are provided. In connection with the ignition switch a circuit is closed allowing current to flow through the generator windings, causing the armature to revolve slowly, facilitating the meshing of the reduction gears. One clutch permits this rotation, and also permits a relatively high speed of the armature, necessary when operating as a starter. The second overrunning clutch prevents the engine driving the armature through the reduction gears. Depressing the starting pedal meshes the reduction gears, opens the generator circuit and allows the motor brush to come in contact with the commutator, closing the starter circuit and cranking the engine. When the pedal is released, a spring reverses these operations.

Generator.—Generator current regulation is by reverse series field.

Amperes	GENERATOR DATA, MOTOR-GENERATOR No. 56	R. P. M.
Neutral		350
4		500
12		1000
16-22		1500

When operating as a motor with the overrunning clutch as the only retarding force, generator draws 4 amperes.

Oiling.—Put 5 or 6 drops of light engine oil in each of starter-generator oilers every two weeks. At the same time turn down the grease cup two turns. If car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles. Every six months renew the grease in the distributor gear housing.

Relay.—There is no relay. The circuit between the generator and the battery is controlled by the ignition switch. The overrunning clutch at driving end allows generator to operate as a motor when battery's pressure is above that of generator. The noise made by the clutch serves to attract the operator's attention to open the ignition switch. The opening and closing of the generator-battery circuit by the operator takes the place of the relay.

Lamps.—Head lamps are 6-8 volt, 15 cp. Tail and dash lamps are each 6-8 volt, 2 cp.

Circuit Breaker.—There is a vibrating circuit breaker on the back of the lighting switch which takes the place of fuses in the lighting circuits. It requires a current of 25 amperes to start this device vibrating, but when vibrating 3 to 5 amperes will cause it to continue.

Model Numbers.—Motor-generator is No. 56. Ignition coil is No. 2111. Combination switch is No. 1048.

Plate No. 75

SERVICE ENGINEERING COMPANY, SAN FRANCISCO—COPYRIGHTED, 1926

Battery.—Battery is 6 volt, 100 ampere-hour. The negative (—) terminal is grounded. There is also a set of dry cells so connected that they may be switched into the ignition circuit should other pressure sources fail.

Ignition.—Breaker contacts separate .010 to .012 inch. When the condition of the points affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sand paper. The copper pigtail must always be intact.

Oiling.—Put 5 or 6 drops of light engine oil in the upper ball bearing, accessible when distributor head and rotor are removed, every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Timing.—On the C-54 and C-55 Models, the breaker contacts separate when the engine is turned to the 7 degree mark on flywheel (about 1 inch past dead center), spark control lever and breaker assembly in the fully retarded position. On the C-36 and C-37 Models the breaker contacts separate when piston entering power stroke is on top dead center, spark control lever midway between the fully advanced and fully retarded positions. (First see that the breaker assembly is fully retarded when the control lever is in the fully retarded position).

Firing Order.—The firing order of the C-36 and C-37 Models is 1, 3, 4, 2. The firing order of the C-54 and C-55 Models is 1, 4, 2, 6, 3, 5.

Spark Plug Gaps.—Spark plug gaps are .027 to .030 inch.

Starter-Generator.—Starter and generator are combined into one unit, but are electrically separate. Starter is connected to the engine through a set of reduction gears and a pinion shifted by the operator. Two overrunning clutches are provided. In connection with the ignition switch, a circuit is closed, allowing current to flow through the generator windings, causing the armature to revolve slowly, facilitating the meshing of the reduction gears. One clutch permits this rotation, and also permits a relatively high speed of the armature, necessary when operating as a starter. The second overrunning clutch prevents the engine from driving the armature through the reduction gears. Depressing the starting pedal meshes the reduction gears, opens the generator circuit and allows the motor brush to come into contact with the commutator, closing the starter circuit, and cranking the engine. When the pedal is released a spring reverses these operations.

Generator.—Generator voltage regulation is by automatic field rheostat. Motor-generator No. 51 is used on the Models C-36 and C-37 and No. 52 on the C-54 and C-55 cars.

GENERATOR DATA

Motor-Generator No. 51		Motor-Generator No. 52	
Amperes	R. P. M.	Amperes	R. P. M.
Neutral	350	Neutral	510
6-11	500	7-15	750
16-20	900-1050	13-22	1100-1300
9-14.5	1500	12-18	1500

The No. 51 generator, when operating as a motor with the overrunning clutch as the only retarding force, should take 4.5 amperes and under the same conditions the No. 52 generator takes 5.5 amperes. Charging rate is varied by changing the regulating resistance spool.

Oiling.—Put 5 or 6 drops of light engine oil in each of motor-generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles. Once a year remove the name plate and lubricate the spiral gears with soft cup grease, limiting the amount so that none will work through to the regulating resistance, interfering with its operation.

Relay.—There is no relay. The circuit between the generator and battery is controlled by the ignition switch.

Lamps.—On the C-36 and C-37 Models the head lamps are 6-8 volt, 18 cp. Dash and tail lamps are each 6-8 volt, 2 cp. On the C-54 and C-55 Models the head lamps are 6-8 volt, 21 cp. Dash and tail lamps are each 6-8 volt, 2 cp.

Circuit-Breaker.—There is a vibrating circuit breaker on the back of the combination switch which takes the place of fuses in the lighting circuits. It requires a current of 25 amperes to start this device vibrating, but when vibrating 3 to 5 amperes will cause it to continue.

Plate No. 76

Kissel Kar

MODEL 4-36 (1915)

WESTINGHOUSE GENERATING AND LIGHTING SYSTEM

KISSEL STARTER. WESTINGHOUSE IGNITION

BATTERY.—Willard, Type SLB-610 AB-30, 6 volt, 100 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Breaker contacts separate .005 to .008 inch. When the condition of the points affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper. Adjust the distributor brush springs so that the brushes extend 1/4 inch from their holders when the distributor cap is removed, retaining them however, so that they do not fall out. Brushes must move freely in their holders. See that the brushes on the top and bottom of the rotor are in place when installing rotor.

OILING.—See generator oiling.

TIMING.—Breaker contacts begin to separate when piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 3, 4, 2.

SPARK PLUG GAPS.—Spark plug gaps are .020 to .025 inch.

STARTER.—Kissel. Starter is connected to the engine through a Bendix drive. Starter cranks the engine at 150 R.P.M.

OILING.—Put 4 or 5 drops of light engine oil in each of starter oilers every month.

GENERATOR.—Frame No. 280. Generator current regulation is by reverse series field.

Generator Data		
Battery Amperes	Total Output	R.P.M.
1	2.2	300
3.6	8	500
7.4	14	1000
9.2	15.5	1500
9.6	16.2	2000
10	17	2500

The current for the lights does not pass through the reverse series field, so when the lights are turned on the output automatically increases to supply the extra current used, keeping the charging rate practically constant. Maximum charging rate of 9-10 amperes is reached at 1500 R.P.M. of armature.

OILING.—Put 4 or 5 drops of light engine oil in the distributor bearing oiler and generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 300 R.P.M. of armature or 8 miles per hour, and opens at 250 R.P.M. or 6 miles per hour. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 24 cp. Dash and tail lamps are 6-8 volt, 2 cp.

FUSES.—Fuses are 15 ampere.

Model 50 (1916-17) (Serial Nos. 500000 to 502000)

Delco Generating, Starting and Lighting System

Delco Ignition

Battery.—Battery is 6 volt, 100 ampere-hour. The negative (—) terminal is grounded.

Ignition.—Breaker contacts separate .018 inch. They are made of tungsten. When the condition of the points affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel.

Timing.—Breaker contacts separate when flywheel marking "1 and 4" is under the center of the hole in top of flywheel case, spark control lever and breaker assembly in the fully retarded position. The hole through which flywheel may be viewed is covered by a removable plate.

Firing Order.—The firing order is 1, 8, 3, 6, 4, 5, 2, 7.

Spark Plug Gaps.—Spark plug gaps are .032 inch.

Oiling.—Put 5 or 6 drops of light engine oil in the oil hole on the side of the distributor housing every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Starter.—Starting motor is No. 72. Starter is connected to the engine through a Bendix drive. Lock torque is 17.5 pound-feet. Operating without load motor takes 40 amperes.

Oiling.—Starter bearings are of the oilless type and require no lubrication

Generator.—Generator current regulation is by third brush system.

GENERATOR DATA, No. 91

Cold—Amperes	R. P. M.	Warm—Amperes	R. P. M.
Neutral	625 or less	Neutral	650
5.0-7	800	4.0-6	800
9.5-13	1000	8.5-11	1000
15.0-19	1600	14.0-18	1600
17.0-21	1800	14.0-20	1800
16.0-21	2000	16.0-20	2000

Generator begins to supply current at 6-8 miles per hour, and reaches its maximum output at 18-20 miles per hour.

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.

Relay.—There is no relay. The circuit between the generator and the battery is controlled by the ignition switch.

Lamps.—Head lamps are 6-8 volt, 14 cp. Tail lamp is 6-8 volt, 2 cp. Dash lamp is 6-8 volt, 2 cp.

Circuit Breaker.—There is a vibrating circuit breaker on the back of the combination switch which take the place of fuses in the lighting circuits. It requires a current of 25 amperes to start this device vibrating, but once vibrating 3 to 5 amperes will cause it to continue.

Model Numbers.—Starter is No. 72. Generator is No. 91. Combination switch is No. 1067. Ignition coil is No. 2123.

Davis

Models C-38, 6-E, 6-G (1916)

Delco Generating, Starting and Lighting System

Delco Ignition

Battery.—Battery is 6 volt, 100 ampere-hour. The negative (—) terminal is grounded.

Ignition.—Breaker contacts separate .018 inch. They are made of tungsten. When the condition of the points affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

Timing.—Breaker contacts begin to separate when the top dead center mark on flywheel is at indicator, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—Spark plug gaps are .027 to .030 inch.

Oiling.—Put 4 or 5 drops of light engine oil in timer bearing oiler every two weeks. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.

Starter.—Starter is connected to engine through a set of reduction gears meshed by the operator. Two overrunning clutches are provided. In connection with the ignition switch a circuit is closed allowing current to flow through the generator windings causing the armature to revolve slowly, aiding the meshing of the reduction gears. One clutch permits this rotation, and also permits a relatively high speed of the armature, necessary when operating as a starter. The second overrunning clutch prevents the engine driving the armature through the reduction gears. Depressing the starting pedal meshes the reduction gears, opens the generator circuit and allows the motor brush to come in contact with the commutator, closing the starter circuit and cranking the engine. When the pedal is released, a spring reverses these operations.

Generator.—Generator current regulation is by third brush system. Generator begins to supply current at 8 miles per hour or 400-450 R. P. M. of armature. Maximum charging rate of 16-20 amperes is reached at 20-25 miles per hour.

GENERATOR DATA, MOTOR-GENERATOR MODELS 73, 81 AND 83

Amperes	R. P. M.
Neutral	400
6-10	600
16-20	1000
10-15	1500
9-13	1800

When operating freely as a motor, clutch at driving end the only retarding force, generator takes 4.5 amperes.

Oiling.—Put several drops of light engine oil in rear starter-generator bearing oiler every two weeks. At the same time fill the front oiler. If car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles. Refill grease cup at end of idler reduction gear shaft with soft cup grease and turn down every month.

Relay.—There is no relay. The circuit between the generator and the battery is controlled by the ignition switch. The overrunning clutch at driving end allows generator to operate as a motor when battery's pressure is above that of generator. If engine is killed when stopping the noise made by the clutch serves to attract the operator's attention to open the ignition switch. The opening and closing of the generator-battery circuit by the operator takes the place of the relay.

Lamps.—Head lamps are 6-8 volt, 18 cp. Dash lamp is 6-8 volt, 2 cp. Tail lamp is 6-8 volt, 2 cp.

Circuit Breaker.—A vibrating type circuit breaker takes the place of fuses. It takes 25 amperes to start this device vibrating, but when vibrating 3 to 5 amperes will cause it to continue.

Model Numbers.—Motor-generator is Model No. 73, 81 or 83. Ignition coil is Model No. 2120, 2124, 2125, 2140 or 2141. Combination switch is Model No. 1058 or 1067

14-16	1400	15.5-18.0	1400
11-13	2000	13.0-17.0	2000

Generator begins to supply current at 7-8 miles per hour and reaches its maximum output at 20-22 miles per hour. To increase the charging rate move the third brush in a counter-clockwise direction (looking at commutator end) and in a clockwise direction, to increase the charging rate.

Oiling.—Put 5 or 6 drops of light engine oil in each of generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Relay.—There is no relay. The circuit between the generator and the battery is controlled by the ignition switch. The overrunning clutch at driving end allows generator to operate as a motor when battery's pressure is above that of generator. The noise made by the clutch serves to attract the operator's attention to open the ignition switch. The opening and closing of the generator-battery circuit by the operator, takes the place of the relay.

Lamps.—Head lamps are 6-8 volt, 15 cp. Dash and tail lamps are each 6-8 volt, 2 cp.

Model Numbers.—Generator is No. 114 Starter is No. 102. Ignition coil is No. 2139 Combination switch is No. 1067.

Plate No. 81

Auburn

Mod 1 6-40 (1915)

Delco Generating, Starting and Lighting System

Delco Ignition

Battery.—Battery is 6 volt, 80 ampere-hour. The negative (—) terminal is grounded. There is also a set of 5 dry cells connected so that they can be switched into the ignition switch should other sources fail.

Ignition.—Breaker contacts should separate .010 inch. When the bumper of the contact spring is on the highest part of the cam the clearance between the stop on the spring and contact blade should be .015 inch. Should contacts become badly burned or pitted resurface them with a fine, flat jeweler's file or a piece of worn No. 00 sand paper.

Timing.—Contacts should begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—Spark plug gaps should be .027 inch.

Oiling.—Remove distributor cover and rotor and put 4 or 5 drops of light engine oil in the bearing every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Starter.—Starter is connected to the engine by a set of gears shifted by the operator. Starter should develop at least 16 pound feet, lock torque. When operating free, it should not take over 45 amperes. Starter should be tested with a terminal voltage of 3.5-3.8 volts, current flowing.

Oiling.—The grease cup on the end of the idler gear shaft provides lubrication for the clutch. It should be refilled with soft cup grease, and turned down every month.

Generator.—Generator current regulation is by an automatic field rheostat. This device consists of a coil of nichrome wire in series with the shunt field. There is a movable contact, operated by centrifugal weights on the timer shaft, to regulate the amount of the coil which is in circuit. When the engine is idle the coil is cut out of the circuit. As the engine speeds up the contact is moved along the coil, cutting more and more resistance into the field circuit as the speed increases, thus regulating the output. The output may

GENERATOR DATA, MOTOR-GENERATOR No. 58

16-22	1100-1300

The circuit between generator and battery is controlled by the ignition switch, there being no relay. When operating freely as a motor the overrunning clutch as the only retarding force, generator should take 5.5 amperes.

Oiling.—Put 5 or 6 drops of light engine oil in the oil hole in each of generator bearings every two weeks. Thoroughly clean out the distributor driving gear case and repack with soft cup grease several times a season. When oiling bearings, put a few drops of oil in gear case to keep grease soft. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Lamps.—Head lamps are 6-8 volt, 15 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash lamp is 6-8 volt, 2 cp. Tail lamp is 6-8 volt, 2 cp. Single contact base is used.

Model Numbers:—Motor-generator is No. 58. Ignition coil is No. 2111. Combination light and ignition switch is No. 1050. Battery is Exide Type, 3X155-1.

DELCO IGNITION

BATTERY.—Battery is 6 volt, 100 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Coils are Model No. 2123. Distributor Model No. 5156. There are two separate coils, timers and distributors, providing a separate ignition system for each cylinder block. Breaker contacts separate .018 inch. They are made of tungsten. When the condition of the points affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING.—Remove top cover of timer and put 4 or 5 drops of light engine oil in each of oil holes exposed, and in the top vertical bearing. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.

TIMING.—Contacts begin to separate when the top dead center mark on flywheel is at indicator, spark control level and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1R, 1L, 4R, 4L, 2R, 2L, 6R, 6L, 3R, 3L, 5R, 5L.

SPARK PLUG GAPS.—Spark plug gaps are .027 to .030 inch.

STARTER.—Model No. 86. Starter is connected to engine through a Bendix drive. Lock torque is 16 pound-feet. Running freely, starter takes 40 amperes.

OILING.—Put several drops of light engine oil in each of starter oilers every month.

GENERATOR.—Model No. 87. Generator current regulation is by third brush system. Generator begins to supply current at 7-9 miles per hour, or 500-550 R.P.M., of armature. Maximum charging rate is 15-17 amperes, reached at 20-25 miles per hour, or 1400 R.P.M., of armature.

Generator Data. Model No. 87

Hot Test		Cold Test	
Amperes	R.P.M.	Amperes	R.P.M.
Neutral	500	Neutral	500
11-13	900	11.5-13.5	900
16-18	1400	16.5-19.5	1400
15-17	1800	15.5-18.5	1800
14-16	2000	15.0-18.0	2000

Output is varied by adjusting third brush. Moving brush in direction of armature rotation increases output. Moving it in the opposite direction decreases output.

OILING.—Put 5 or 6 drops of light engine oil in each of generator bearing oilers every two weeks. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.

RELAY.—There is no relay. The circuit between the generator and battery is controlled by the ignition switch.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dimmer lamps are 6-8 volt, 4-6 cp. Dash lamp is 6-8 volt, 2 cp. Tail lamp is 6-8 volt, 2 cp. Tonneau lamp is 6-8 volt, 4 cp.

CIRCUIT BREAKER.—A vibrating circuit breaker takes the place of fuses. It requires a current of 25 amperes to start this device vibrating, but when vibrating, 3 to 5 amperes will cause it to continue.

Plate No. 83

CADILLAC

MODEL 40 (1912). SERIAL NOS. 61,006 TO 75,000

DELCO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

BATTERY.—Battery is 24 volt, 45 ampere-hour. Battery is divided into four groups of three cells each. The controller connects the four groups in series for starting and in parallel for charging. Six dry cells connected in series supply current for the auxiliary ignition. The two-wire system is used.

IGNITION.—There are two distinct ignition systems, employing two sets of spark plugs. Breaker contacts separate .010 inch. When the contacts are closed, the contact blade and clip separate .015 inch. See that the pigtail conducting the current to the contact blade is not disconnected. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper. An ignition relay is used in the auxiliary ignition circuit. See page 68 for instruction for the care and adjustment of the ignition relay.

OILING.—Put 3 or 4 drops of light engine oil in each of the timer bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

TIMING.—Breaker contacts begin to separate when the flywheel marking "1 & 4 D. C." is 1/2 inch past the indicator, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 2, 4, 3.

SPARK PLUG GAPS.—Spark plug gaps are .020 to .025 inch.

STARTER-GENERATOR.—Model No. 1. Starter and generator are combined into one unit. Starter is connected to the engine through a sliding pinion, meshed with the flywheel gear by the operator. Running freely, starter takes 14 amperes, armature revolving at 1800 R.P.M.

GENERATOR.—Generator current regulation is by reverse series field.

Amperes	Generator Data	R.P.M.
Neutral	-----	300
5	-----	500
12	-----	1000
17-22	-----	1500

Operating freely as a motor with the overrunning clutch at the driving end as the only retarding force, generator takes 45 amperes. Charging rate is varied by changing the value or the shunt resistance, located between the two top terminals on the "Charge" side of the controller switch. Two shunts are available, a single strand which permits a low charging rate, and a double strand which permits a high charging rate. Never substitute copper wire for the resistor, as the generator current will then be excessive. An ampere-hour meter is intended to reduce or stop the charging as the battery becomes fully charged. See Page 72A for a description of the ampere-hour meter and instructions for its adjustment and care.

OILING.—Put 4 or 5 drops of light engine oil in each of the starter-generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted above the controller switch. Relay closes at 7-9 miles per hour or 300-350 R.P.M. of the armature, and opens at 5-7 miles per hour or 250-300 R.P.M. of the armature. Charging current is 1-3 amperes at closing, and the discharge current is 0-1 ampere at the opening of relay contacts. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 15 cp. Side lamps are 6-8 volt, 7 cp. Speedometer

MODEL (1914)

DELCO GENERATING, STARTING AND LIGHTING SYSTEM

DELCO IGNITION

BATTERY.—Exide, Type 3-PH-13, 6 volt, 130 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Coil Model No. 2104. Breaker contacts separate .010 inch. When contacts are closed contact blade and clip separate .015 inch. See that pigtail conducting current to the contact blade is not disconnected. When the condition of the points affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Put several drops of light engine oil in timer bearing oilers every two weeks. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.

TIMING.—Breaker contacts begin to separate when piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 2, 4, 3.

SPARK PLUG GAPS.—Spark plug gaps are .027 to .030 inch.

STARTER.—Starter-Generator Model No. 24. Starter and generator are combined into one unit, but are electrically separate. Starter is connected to engine through a set of reduction gears meshed by the operator. Pressing the "Start" button brings ignition relay into action and connects terminals 8 and 9 on the combination ignition and lighting switch, completing circuit around relay. This applies battery pressure to generator windings, causing armature to revolve slowly, aiding meshing of the gears. Depressing the starting pedal then meshes the gears, opens the generator circuit and completes motor circuit, causing it to crank the engine. Two overrunning clutches are provided. Clutch at driving end permits rotation of armature necessary during cranking operation. The second overrunning clutch prevents engine driving starter through the reduction gears.

GENERATOR.—Generator voltage regulation is by a mercury tube regulator.

16.0-21	2000	14.0-20	2000

To change charging rate loosen the two screws which hold third brush arm. Move the brush in a clockwise direction (looking at commutator end) to increase the charging rate, and in a counter-clockwise direction to decrease the charging rate. Tighten the adjusting screws and reseal brush after adjusting position. Generator begins to supply current at 7-8 miles per hour, and reaches its maximum output at 20-25 miles per hour.

Oiling.—Put 6 or 8 drops of light engine oil in each of the generator bearing oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Relay.—There is no relay. The circuit between the generator and battery is controlled by the ignition switch.

Lamps.—Head lamps are 6-8 volt, 15 cp. Dimmer lamps are 6-8 volt, 5 cp. Dash and tail lamps are 6-8 volt, 2 cp.

Circuit Breaker.—There is a vibrating circuit breaker on the back of the lighting switch which takes the place of fuses in the lighting circuits. It requires a current of 25 amperes to start this device vibrating, but when vibrating, 3 to 5 amperes will cause it to continue.

Model Numbers.—Generator is No. 91. Starter is No. 72. Combination switch is No. 1066 or No. 1067. Ignition coil is No. 2123.

Oldsmobile

Model 42 (1915)

Delco Generating, Starting and Lighting System

Delco Ignition

Battery.—Battery is 6 volt, 120 ampere-hour. The negative (—) terminal is grounded.

Ignition.—Breaker contacts separate .010 inch. When contacts are closed, contact blade and clip separate .015 inch. See that pigtail conducting current to the contact blade is not disconnected. When the condition of the points affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sand paper.

Oiling.—Put several drops of light engine oil in timer bearing oiler every two weeks. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.

Timing.—Breaker contacts begin to separate when the top dead center mark on flywheel is at indicator, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plug Gaps.—Spark plug gaps are .027 to .030 inch.

Starter-Generator.—Model No. 49. Starter and generator are combined into one unit but are electrically separate. Starter is connected to the engine through a set of reduction gears meshed by the operator. Two overrunning clutches are provided. In connection with the ignition switch, a circuit is closed allowing current to flow through the generator windings, causing the armature to revolve slowly, aiding the meshing of the reduction gears. One clutch permits this rotation and also permits a relatively high speed of the armature, necessary when operating as a starter. The second overrunning clutch prevents the engine from driving the armature through the reduction gears. Depressing the starting pedal meshes the reduction gears, opens the generator circuit and allows the motor brush to come in contact with the commutator, closing the starter circuit and cranking the engine. When the pedal is released, a spring reverses these operations.

Generator.—Generator voltage regulation is by automatic field rheostat operated from a governor on the distributor shaft. Generator begins to supply current at 7-9 miles per hour or 350-400 R. P. M. of armature. Maximum charging rate of 16-18 amperes is reached at 20-25 M. P. H. or 900-1050 R. P. M. of armature.

GENERATOR DATA, MOTOR-GENERATOR MODEL No. 49

Amperes	R. P. M.
Neutral	350
6-11	500
16-20	900-1050
9-14	1500

Charging rate is varied by changing the regulating resistance spool. There are six different spools available namely, Nos. 633, 703, 702, 701, 817 and 955. No. 633 is wound with the largest wire, the sizes reducing in the order named. Installing a spool of larger wire increases the output. The spools have a wide brass cap at one end and a narrow cap at the other end. Minimum output with each spool is obtained when installed with the narrow cap at the bottom. The contact arm must bear on the resistance spool with a pressure of 6 ounces. A poor contact between the arm and spool will cause the generator to motor at excessive speed when the ignition switch is closed. Operating freely as a motor, clutch at driving end as the only retarding force, current is 4.5 amperes.

Oiling.—Put several drops of light engine oil in each of starter-generator bearing oilers every two weeks. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles. Refill grease cup at end of idler gear shaft with soft cup grease and turn down every month.

Relay.—There is no relay. The circuit between the generator and the battery is controlled by the ignition switch. The overrunning clutch at driving end allows generator to operate as a motor when battery's pressure is above that of generator. If engine is killed when stopping the noise made by the clutch serves to attract the operator's attention to open the ignition switch. The opening and closing of the generator-battery circuit by the operator, takes the place of the relay.

Lamps.—Head lamps are 6-8 volt, 18 cp. Dash lamp is 6-8 volt, 2 cp. Tail lamp is 6-8 volt, 2 cp.

Circuit-Breaker.—A vibrating circuit breaker takes the place of fuses. It requires a current of 25 amperes to start this device vibrating. While vibrating, the current flow is 3-5 amperes

Battery.—Battery is 6 volt, 120 ampere-hour. The negative (—) terminal is grounded.

Ignition.—Breaker contacts separate .010 inch. When contacts are closed, contact blade and clip separate .015 inch. See that pigtail conducting current to the contact blade is not disconnected. When the condition of the points affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sand paper

Oiling.—Put several drops of light engine oil in distributor shaft bearing oiler every two weeks. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.

Timing.—Breaker contacts begin to separate when the top dead center mark on flywheel is $1\frac{1}{2}$ inches before indicator, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—Spark plug gaps are .027 to .030 inch.

Starter-Generator.—Model No. 54. Starter and generator are combined into one unit, but are electrically separate. Starter is connected to the engine through a set of reduction gears meshed by the operator. Depressing starter pedal mechanically closes the relay, allowing current to flow through the generator windings, causing the armature to revolve slowly, aiding the meshing of the reduction gears. An overrunning clutch permits this rotation, and also permits a relatively high speed of the armature, necessary when operating as a starter. Depressing starter pedal further meshes the gears, raises the generator brush and allows the motor brush to come into contact with the commutator, closing the starter circuit and cranking the engine. A second overrunning clutch prevents the engine from driving the armature through the reduction gears. Generator brush must be lifted during the cranking operation.

Generator.—Generator voltage regulation is by mercury regulator. Charging current will vary with state of charge of battery, being 18-20 amperes when battery is badly discharged, but reducing to 10-12 amperes as battery becomes charged. Maximum charging rate is reached at 20-25 miles per hour.

R. P. M.	GENERATOR DATA, MODEL 54	Amperes

Oiling.—Put several drops of light engine oil in each of starter-generator oilers every two weeks. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles. Refill grease cup at end of idler gear shaft with soft cup grease and turn down every month.

Relay.—Relay closes at 7-9 miles per hour or 475 R. P. M. of armature, and opens at 5-7 miles per hour or 400 R. P. M. of armature. Charging current is 1 to 3 amperes at closing and the discharge current 0 to 1 ampere at opening of relay. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sand paper. Remove all grit. Adjust before again putting into service.

Lamps.—Head lamps are 6-8 volt, 20 cp. Dash lamp is 6-8 volt, 2 cp. Trouble lamp is 6-8 volt, 4 cp. Tail lamp is 6-8 volt, 2 cp.

Model Numbers.—Generator is Model No. 54. Ignition coil is No. 2111. Combination switch is No. 1035. Battery is Exide Type 3-MH-155-A.

Oldsmobile

Models 45 and 37 (1917) (Serial Nos. 119000 to 200000)

Delco Generating, Starting and Lighting System

Delco Ignition

Battery.—Battery is 6 volt, 85 ampere-hour. The negative (—) terminal is grounded.

Ignition.—Breaker contacts separate .018 inch. They are made of tungsten. When the condition of the points affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

Timing.—Breaker contacts separate when the upper dead center mark on the flywheel is 1½ inches before the indicator, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1R, 4L, 3R, 2L, 4R, 1L, 2R, 3L.

Spark Plug Gaps.—Spark plug gaps are .027 to .030 inch.

Oiling.—Put 5 or 6 drop of light engine oil in the oil hole on the side of the distributor housing every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Starter.—Starting Motor No. 72 is used on the the Model 45 cars, and Motor No. 100 is used on the Model 37 cars. The lock torque of Motor No. 72 is 17.5 pound-feet, and of No. 100 is 16 pound-feet. Both motors when running freely, take 40 amperes.

Oiling.—Starter bearings are of the oilless type and require no lubrication.

Generator.—Generator current regulation is by third brush system. Generator No. 113 is used on the Model 45 cars, and No. 111 is used on the Model 37 cars.

No. 113		GENERATOR DATA		No. 111	
Amperes	R. P. M.	Amperes		R. P. M.	
Neutral	500	Neutral		500	
11-13	900	10-12		900	
16-18	1400	14-16		1400	
15-18	1800	11-13		2000	
14-16	2000				

To adjust the charging rate, loosen the two screws on the third brush arm. Move the brush to the right to increase the charging rate and to the left to decrease it. Tighten the adjusting screws and reseal the brush after adjusting position. Generator begins to supply current at 7-8 miles per hour and reaches its maximum output at 20-25 miles per hour.

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Relay.—There is no relay. The circuit between the generator and battery is controlled by the ignition switch.

Lamps.—Head lamps are 6-8 volt, 15 cp. Dimmer lamps are 6-8 volt, 4-6 cp. Dash and tail lamps are each 6-8 volt, 2 cp.

Circuit-Breaker.—There is a vibrating circuit breaker on the back of the lighting switch which takes the place of fuses in the lighting circuits. It requires a current of 25 amperes to start this device vibrating, but when vibrating 3 to 5 amperes will cause it to continue.

Mod 1 Numbrs.—On the Model 45 cars the generator is No. 113. Starter is No. 72. Ignition coil is No. 2153, and combination switch is No. 1066. On the Model 37 cars the starter is No. 100. Generator is No. 100. Ignition coil is No. 2137 and combination switch is No. 1066.

Plate No. 90

Stutz

Series E and F (1914-15)

Remy Generating, Starting and Lighting System Bosch or Remy Ignition

Battery.—Battery is 6 volt, 130 ampere-hour. The two wire system is used.

Ignition.—Bosch Two-Spark Dual Magneto or Remy Model O Battery Ignition. Breaker contacts separate .014 to .016 inch on magneto, or .020 to .025 inch with Remy ignition. When the condition of the points affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sand paper.

Oiling.—Put 2 or 3 drops of light machine oil in each of magneto oilers every month. If car is driven more than 1000 miles in a month, the oiling must be done every 1000 miles.

Timing.—With Bosch ignition, breaker contacts begin to separate when piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position. With Remy battery ignition, breaker contacts begin to separate when the top dead center mark on the flywheel is one inch past the indicator, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plug Gaps.—Spark plug gaps are .018 to .025 inch.

Starter.—Model Nos. 5-A or 126-A. Starter is connected to the engine through a Bendix drive.

STARTER DATA

Model No. 5-A			Model No. 126-A			
R. P. M.	Amperes	Volts	Torque	R. P. M.	Amperes	Volts
3600-4200	40-56	5.8-6	0 lb. ft.	4500	40	6.0
1900	100		1 lb. ft.	2200	85	5.8
1700	125		2 lb. ft.	1600	110	5.6
1500	150		3 lb. ft.	1350	135	5.3
1350	175		24 lb. ft.	Lock	520	3.6

With the No. 5-A starter the torque is 2 pound-feet at 1500-1800 R. P. M. with 150 amperes at 5.3-5.4 volts.

Oiling.—Put 5 or 6 drops of light engine oil in each of starter bearings every month.

Generator.—Model O or OB. Generator current regulation is by third brush system.

Amperes	GENERATOR DATA		R. P. M.
0			300
7.5			500
14.0-18			1000-1300
12.0			2050

Shunt field current is 1.3 amperes at 6.5 volts. Armature current is 12 amperes at 6.5 volts, applied across main brushes. On earlier generators, up to No. 30000, the field current is 1.7 amperes and the armature current 4 amperes, when tested as above. Air gap between armature and pole pieces is .018 to .022 inch. The Model OB generator is equipped with a "Summer" and "Winter" switch. When the switch is placed on the "Summer" side the output is reduced 3 to 5 amperes.

Oiling.—Put 4 or 5 drops of light engine oil in each of generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Relay.—Relay closes at 7-9 miles per hour or 300-350 R. P. M. of armature, and opens at 5-7 miles per hour or 250-300 R. P. M. of armature. Relay contacts open .014 to .016 inch. Air gap between relay armature and coil core is .040 inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sand paper. Remove all grit. Adjust before again putting into service.

Lamps.—Head lamps are 6-8 volt, 24 cp. Side lamps are 6-8 volt, 5 cp. Tail lamp is 6-8 volt, 2 cp.

Fuses.—Fuses are 15 ampere.

Plate No. 92

PREMIER

MODELS M AND MJ (1913, 1914, 1915)

REMY GENERATING AND LIGHTING SYSTEM

REMY IGNITION

BATTERY.—Battery is 12 volt, 35 ampere-hour. The two wire system is used. A tap is taken off the middle connector to supply 6 volts for lights and ignition.

IGNITION.—Breaker contacts separate .025 to .030 inch. When the condition of the points affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sand paper.

Oiling.—See generator oiling.

Timing.—Breaker contacts begin to separate when piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 4, 2, 6, 3, 5.

Spark Plug Gaps.—Spark plug gaps are .025 to .030 inch.

GENERATOR.—Model M or MJ. Generator current regulation is by reverse series field. There are three field windings: The shunt of 1000 turns of No. 24 wire, and two series coils, of 40 turns each, one of No. 12 and the other of No. 13 wire.

Maximum charging rate is reached at 25-30 miles per hour. Shunt field current 1.5 amperes at 12 volts.

Generator Data

Amperes	R.P.M.
0	325
3.5	500
4.5-6.5	2000

Oiling.—Put several drops of light engine oil in each of generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Model M. Relay closes at 350-400 R.P.M. of armature or 6-8 miles per hour, and opens at 275-325 R.P.M. of armature or 4-6 miles per hour. There is a 1¼ ampere fuse on relay base. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sand paper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 17 cp. Side lamps are 6-8 volt, 6 cp. Dash and tail lamps are 6-8 volt, 2-4 cp.

FUSES.—Generator fuse is 1¼ ampere. Lighting fuses are 10 ampere.

Cole, Models 4-40 (1915) and 6-66 (1916). Delco System
Plate No. 93

COLE MODELS 4-40 (1915) AND 6-66 (1916) DELCO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

BATTERY.—Exide, Type 3X-155-1, 6 volt, 100 ampere hour. The negative (—) terminal is grounded. Five dry cells, connected in series, are so arranged that they may be switched into the ignition circuit should other sources fail.

IGNITION.—Breaker contacts separate .010 to .012 inch. When contacts are closed, contact blade and clip separate .015 inch. See that pigtail conducting current to the contact blade is not disconnected. When the condition of the points affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Put 4 or 5 drops of light engine oil in timer unit bearings every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

TIMING.—Breaker contacts begin to separate when entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order of the 6 cylinder cars is 1, 5, 3, 6, 2, 4. The firing order of the 4 cylinder cars is 1, 3, 4, 2.

SPARK PLUG GAPS.—Spark plug gaps are .025 inch.

STARTER-GENERATOR.—Model No. 65 or 77. Starter and generator are combined into one unit but are electrically separate. Two overrunning clutches are provided. In connection with the ignition switch, a circuit is closed, allowing a current to flow through the generator windings causing the armature to revolve slowly, aiding the meshing of the reduction gears. One clutch permits this rotation, and also permits a relatively high speed of the armature, necessary when operating as a starter. The second overrunning clutch prevents the engine from driving the armature through the reduction gears. Depressing the starting pedal meshes the reduction gears, opens the generator circuit, and allows the motor brushes to come in contact with the commutator, closing the starter circuit and cranking the engine. When the pedal is released, a spring reverses these operations.

GENERATOR.—Generator current regulation is by reverse series field and vibrating regulator. Maximum current output is 15 amperes, reached at 600-700 R.P.M. of armature, or 18-20 miles per hour.

OILING.—Put 5 or 6 drops of light engine oil in each of starter-generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles. Refill the grease cup on the intermediate shaft and turn down two turns every month.

RELAY.—There is relay. The circuit between the generator and the battery is controlled by the ignition switch.

REGULATOR.—Regulator is mounted on top of generator frame. To adjust regulator connect an ammeter in the circuit between terminal "6" of the combination switch and terminal "2" of the generator. Adjust spring tension on regulator armature to limit the maximum current output to 15 amperes at all speeds above 700 R.P.M. Contacts are made of tungsten and require no attention.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dash and tail lamps are connected in series and are each 3-4 volt, 2 cp.

CIRCUIT BREAKER.—A vibrating circuit breaker takes the place of fuses. It requires a current of 25 amperes to start this device vibrating. While vibrating, the current flow is 3-5 amperes.

Delco Generating, Starting and Lighting System

Delco Ignition

Circuit Breaker.—A vibrating circuit breaker takes the place of fuses. It takes 25 amperes to start this device vibrating. While vibrating, the current flow is 3-5 amperes

Battery.—Battery is 6 volt, 100 ampere-hour. The negative (—) terminal is grounded. There is a set of 5 dry cells so connected that they may be switched into the ignition circuit should other pressure sources fail.

Ignition.—Breaker contacts separate .018 inch. They are made of tungsten. When the condition of the points affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

Oiling.—Put several drops of light engine oil in the distributor bearing every two weeks. If the car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.

Timing.—Breaker contacts begin to separate when piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1R, 4L, 2R, 3L, 4R, 1L, 3R, 2L.

Spark Plug Gaps.—Spark plug gaps are .028 to .030 inch.

Starter.—Starter is connected to the engine through a Bendix drive.

Oiling.—Starter bearings are of the oilless type.

Generator.—Generator voltage regulation is by automatic field rheostat operated from a governor on distributor shaft.

Amperes	GENERATOR DATA, No. 62	R. P. M.
8		1000
13		1500
11		1800

Charging rate is varied by changing the regulating resistance spool. There are six different spools available namely, Nos. 633, 703, 702, 701, 817 and 955. No. 633 is wound with the largest wire, the sizes reducing in the order named. Installing a spool of larger wire increases the output. The spools have a wide brass cap at one end and a narrow cap at the other end. Minimum output with each spool is obtained when installed with the narrow cap at the bottom. The contact arm must bear on the resistance spool with a pressure of 6 ounces. A poor contact between the arm and spool will cause the generator to motor at excessive speed when the ignition switch is closed.

Oiling.—Put 5 or 6 drops of light engine oil in each of generator oilers every two weeks. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.

Relay.—Relay closes at 7-10 miles per hour and opens at 5-8 miles per hour. Charging current is 1 to 3 amperes at closing and discharge current 0 to 1 ampere at opening of relay contacts. With contacts closed air gap between relay armature (moving member) and coil core is .032 inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sand paper. Remove all grit. Adjust before again putting into service.

Lamps.—Head lamps are 6-8 volt, 24 cp. Dash and tail lamps are in series and are each 3.4 volt, 2 cp.

Circuit Breaker.—There is a vibrating circuit breaker on the back of the lighting switch which takes the place of fuses in the lighting circuits. It requires a current of 25 amperes to start this device vibrating, but when vibrating 3 to 5 amperes will cause it to continue.

Mod 1 Numbers.—Starter is No. 63. Generator is No. 62. Ignition coil is No. 2117. Combination switch is No. 1056.

SERVICE ENGINEERING COMPANY, SAN FRANCISCO—COPYRIGHTED, 1926

Carter Car

Model 9 (1915)

Delco Generating, Starting and Lighting System

Delco Ignition

Battery.—Battery is 6 volt, 120 ampere-hour. The negative (—) terminal is grounded. &

Ignition.—Breaker contacts separate .010 inch. When contacts are closed, contact blade and clip separate .015 inch. See that pigtail conducting current to the contact blade is not disconnected. When the condition of the points affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sand paper.

Oiling.—Put 4 or 5 drops of light engine oil in distributor shaft bearing oiler every two weeks. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.

Timing.—Breaker contacts begin to separate when top dead center mark on flywheel is $1\frac{1}{4}$ inches past indicator, spark control lever and breaker assembly in fully retarded position.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plug Gaps.—Spark plug gaps are .027 to .030 inch.

Starter.—Starter is connected to engine through a set of gears meshed by operator. Two overrunning clutches are provided. In connection with the ignition switch, a circuit is closed allowing current to flow through the generator windings, causing the armature to revolve slowly, aiding the meshing of the reduction gears. One clutch permits this rotation, and also permits a relatively high speed of the armature, necessary when operating as a starter. The second overrunning clutch prevents the engine from driving the armature through the reduction gears. Depressing the starting pedal meshes the reduction gears, opens the generator circuit and allows the motor brush to come in contact with the commutator, closing the starter circuit and cranking the engine. When the pedal is released, a spring reverses these operations.

Generator.—Generator current regulation is by reverse series field. Generator begins to supply current at 7-9 miles per hour, or 350-400 R. P. M. of armature. Maximum charging rate of 18-20 amperes is reached at 20-25 miles per hour, or 1500 R. P. M. of armature.

GENERATOR DATA, MOTOR-GENERATOR Model No. 53

Amperes	R. P. M.
Neutral	350
4	500
12	1000
16-22	1500

Operating freely as a motor, clutch at driving end the only retarding force, generator takes 4 amperes.

Oiling.—Put several drops of light engine oil in each of starter-generator bearing oilers every two weeks. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles. Refill grease cup at end of idler gear shaft with soft cup grease and turn down every month.

Relay.—There is no relay. The circuit between the generator and the battery is controlled by the ignition switch. The overrunning clutch at driving end allows generator to operate as a motor when battery's pressure is above that of generator. If engine is killed when stopping, the noise made by the clutch serves to attract the operator's attention to open the ignition switch. The opening and closing of the generator-battery circuit by the operator takes the place of the relay.

Lamps.—Head lamps are 6-8 volt, 15 cp. Dash lamp is each 6-8 volt, 2 cp. Tail lamp is 6-8 volt, 2 cp.

Circuit Breaker.—A vibrating circuit breaker takes the place of fuses. It requires a current of 25 amperes to start this device vibrating. While vibrating, the current flow is 3-5 amperes.

Model Numbers.—Motor-generator is Model No. 53. Ignition coil is Model No. 2111. Combination switch is Model No. 1048. Battery is Exide 3-X-155-1.

Plate No. 97

'APPERSON

MODELS 6-16, 8-16 (1916) AND 6-17, 8-17 (1917) BLJUR GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

BATTERY.—Battery is 6 volt, 80 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Breaker contacts separate .018 inch. They are made of tungsten. When the condition of the points affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING.—Put several drops of light engine oil in timer bearing every two weeks. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.

TIMING.—Breaker contacts begin to separate when top dead center mark on flywheel is $\frac{1}{2}$ inch past indicator, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order of the six cylinder cars is 1, 5, 3, 6, 2, 4. The firing order of the eight cylinder cars is 1R, 4L, 3R, 2L, 4R, 1L, 2R, 3L.

SPARK PLUG GAPS.—Spark plug gaps are .025 to .030 inch.

STARTER.—Type E 68 M, 357. Rotation is anti-clockwise, commutator end. Starter is connected to engine through a Bendix drive.

OILING.—Put several drops of light engine oil in each of starter bearing oilers every month.

GENERATOR.—Type L 61 M 303. Rotation is anti-clockwise, commutator end. Generator current regulation is by third brush system. Maximum generator output is 12-16 amperes, reached at 20-25 miles per hour, or 1400-1600 R.P.M. of armature. Output is varied by shifting third brush. Third brush is secured to generator by two stud bolts, the nuts of which appear in a recess in the front head of generator. Loosen these nuts with a socket wrench and shift the brush by gently tapping the shank of the wrench. Shifting brush in the direction of armature rotation will increase the output. Shifting brush in the opposite direction will decrease the output. Shifting the brush $\frac{1}{16}$ inch will vary the output 2 to 3 amperes. Tighten nuts after adjusting brush. Brush adjustment is made to give the desired rate with generator hot and charging a 3 cell battery reading 1.250 or above. There is a 10 ampere fuse in the small aluminum cap on generator housing to protect generator windings, should excessively high resistance occur in the charging circuits.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.

RELAY.—Relay closes at 10-12 miles per hour or 500-600 R.P.M. of armature, and opens at 8-10 miles per hour, or 450-500 R.P.M. of armature. The charging current is 1 to 3 amperes at closing, and the discharge current 0 to 1 ampere at opening of relay. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 20 cp. Dash lamp is 6-8 volt, 2 cp. Tail lamp is 6-8 volt, 2 cp.

FUSES.—Fuses are 10 ampere.

Olympian

Mod 1 35 (1917)

Auto-Lit Generating, Starting and Lighting System Connecticut Ignition

Battery.—Battery is 6 volt, 80 ampere-hour. The negative (—) terminal is grounded a starting motor.

Ignition.—Breaker contacts separate .023 inch. They are made of tungsten. When the condition of the points affects the ignition, renew the inner breaker mechanism. For temporary service resurface contacts with fine emery cloth.

Oiling.—Refill the cup under the breaker head with pure vaseline and turn down every month. If car is driven more than 1000 miles in a month, this must be done every 1000 miles. Do not put grease or oil in the cup.

Timing.—Breaker contacts begin to separate when piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 2, 4, 3.

Spark Plug Gaps.—Spark plug gaps are .027 to .030 inch.

Starter.—Model ME. Starter is connected to engine through a Bendix drive.

Oiling.—Thoroughly clean out and repack starter bearings with soft cup or ball bearing grease every six months.

Generator.—Model GH. Generator current regulation is by third brush system. Maximum charging rate of 14-16 amperes is reached at 20-25 miles per hour.

Amperes	GENERATOR DATA	R. P. M.
5.0		760-820
10.0		1020-1100
12.5		1200-1300
15.0		1460-1675
15.5-16.8		1950-2250

Output is varied by adjusting third brush. Moving third brush in direction of armature rotation increases output. Moving it in the opposite direction decreases output. When generator is operating freely as a motor, current is 2.7 amperes, armature revolving at 450 R. P. M. Shunt field current is 1.7 amperes.

Oiling.—Put 4 or 5 drops of light engine oil in each of generator oilers every two weeks. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.

Relay.—Relay closes at 7-9 miles per hour or 550-600 R. P. M. of armature and opens at 5-7 miles per hour or 500-550 R. P. M. of armature. Charging current is .5 to 1.5 amperes at closing, and the discharge current 0 to 1 ampere at opening of relay. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sand paper. Remove all grit. Adjust before again putting into service.

Lamps.—Head lamps are 6-8 volt, 15 cp. Dash lamp is 6-8 volt, 2 cp. Tail lamp is 6-8 volt, 2 cp.

Internal Circuits

Kissel-Kar

Models 4-32 and 4-36 (1916)

Westinghouse Generating and Lighting System

Kissel Starter

Westinghouse Ignition

Battery.—Battery is 6 volt, 100 ampere-hour. The positive (+) terminal is grounded.

Ignition.—Breaker contacts separate .005 to .008 inch. When the condition of the points affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sand paper. Adjust the distributor brush springs so that the brushes extend $\frac{1}{4}$ inch from their holders when the distributor cap is removed, retaining them however, so that they do not fall out. Brushes must move freely in their holders. See that the brushes on the top and bottom of the rotor are in place when installing rotor.

Timing.—Breaker contacts begin to separate when the top dead center mark on flywheel is one inch past indicator, spark control lever and breaker assembly in the fully retarded position. Contacts begin to separate when the end of distributor rotor is directly opposite the notch on rim of the case.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plug Gaps.—Spark plug gaps are .023 to .028 inch.

Ballast Resistor.—There is a ballast resistor in the ignition switch. A fuse must not be permanently substituted for this resistor. If necessary to operate the car with the ballast defective, a 5 ampere fuse may be used temporarily, but the ballast must be replaced as soon as possible, as continued operation without it will result in serious burning of the timer contacts.

Oiling.—Put 2 or 3 drops of light machine oil in oiler at side of ignition unit every month.

Starter.—Starter is connected to engine through a Bendix drive. It should crank normal engine at 100 R. P. M.

Oiling.—Put 4 or 5 drops of light engine oil in each of starter oilers every month.

Generator.—Generator voltage regulation is by a vibrating regulator. Charging current will vary with state of charge of battery. When battery is discharged, charging current may reach 14-16 amperes, but this rate reduces to 4-5 amperes as battery becomes fully charged. On test generator delivers 16 amperes at 7.2 volts.

Oiling.—Put several drops of light engine oil in each of generator oilers every two weeks. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.

Relay-Regulator.—Relay is combined with the regulator. The charging current is 1 to 1.5 amperes at closing and the discharge current .75 to 1.25 amperes at opening of relay contacts. The air gap between relay armature (moving member) and coil core is .027 to .030 inch. Contacts separate .013 to .017 inch. Adjust by bending brass prongs. Clean relay and regulator contacts by drawing unglazed paper between them. If badly burned or pitted, resurface them with well worn No. 00 sand paper. Remove all grit. Adjust before again putting into service.

Lamps.—Head lamps are 6-8 volt, 18-21 cp. Dash lamp is 6-8 volt, 2 cp. Tail lamp is 6-8 volt, 2 cp

Fuses.—Fuses are 20 ampere.

Remy Generating, Starting and Lighting System

Remy Ignition

Battery.—Battery is 6 volt, 100 ampere-hour. The two wire system is used.

Ignition.—Breaker contacts separate .015 to .020 inch. When the condition of the points affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sand paper.

Timing.—Breaker contacts begin to separate when the mark "UDC 1 and 6" is 1½ inches past indicator on six cylinder cars, or when mark "UDC 1 and 4" is at indicator on four cylinder cars, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order of the four cylinder cars is 1, 3, 4, 2. The firing order of the six cylinder cars is 1, 4, 2, 6, 3, 5.

Spark Plug Gaps.—Spark plug gaps are .025. to .030 inch.

Oiling.—Refill the cup under the distributor head with soft cup grease and turn down two turns every two weeks. At the same time put a small amount of vaseline on the fiber bumper of the contact arm, using a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

Starter.—Starter is connected to the engine through a set of reduction gears and chain. An overrunning ratchet clutch prevents engine driving starter.

STARTER DATA, MODEL 185

Plate No. 101

Reo

Models R, S, M and N (1916) Remy Generating, Starting and Lighting System Remy Ignition

Continued from preceding page.

Generator.—Generator current regulation is by a vibrating regulator. Maximum charging rate of 10-12 amperes is reached at 15 miles per hour.

GENERATOR DATA, MODEL 240
(Used on R and S, Six Cylinder Cars)

Amperes	R. P. M.	Volts
0	360	6.0-6.4
7.0	500	6.3-6.7
11.0	800	6.5-6.9
12.1	1000	6.5-6.9
12.5	1500	6.5-6.9

When operating freely as a motor, generator takes 3 to 4 amperes at 5.8 volts, armature revolving at 240 R. P. M. Field takes 2 amperes at 5.9 volts.

GENERATOR DATA, MODEL 241
(Used on M and N, Four Cylinder Cars)

Amperes	R. P. M.	Volts
0	550	6.0-6.4
7.0	700	6.3-6.7
11.0	800	6.4-7.0
12.0	1500	6.5-7.9
12.5	2500	6.5-7.9

When operating freely as a motor, generator takes 3 to 4 amperes, armature revolving at 390 R. P. M. Shunt field takes 2 amperes at 5.9 volts.

Oiling.—Put 5 or 6 drops of light engine oil in each of generator oilers every two weeks. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.

Relay-Regulator.—Relay closes at 7-9 miles per hour and opens at 5-7 miles per hour. Charging current is .5 to 1.5 amperes at closing, and the discharge current is 0 to 1 ampere at opening of relay. Clean relay and regulator contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sand paper. Remove all grit. Adjust before again putting into service. Increasing spring tension on regulator armature will increase the output. Decreasing spring tension will decrease the output.

Lamps.—Head lamps are 6-8 volt, 15 cp. Dash and tail lamps are in series. They are each 3-4 volt, 2 cp.

Fuses.—Lighting fuses are 5 ampere.

Model Numbers.—The R and S Models use starter No. 185-A and generator No. 241-A. The M and N Models use starter No. 188-A and generator No. 240-A. Relay-regulator is No. 261-A-B. Ignition coil is No. 45-A.

Model 38 (1916) (Serial Nos. 380,000 to 384,001)
Delco Generating, Starting and Lighting System
Delco Ignition

OAKLAND
MODEL 38 (1916)
DELCO SYSTEM

Plate No. 102

- Battery.**—Battery is 6 volt, 85 ampere-hour. The negative (—) terminal is grounded.
- Ignition.**—Breaker contacts separate .018 inch. They are made of tungsten. When the condition of the points affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.
- Timing.**—Breaker contacts separate when flywheel marking "U. D. C. 1-4" is at indicator, spark control lever and breaker assembly in the fully retarded position.
- Firing Order.**—The firing order is 1, 3, 4, 2.
- Spark Plug Gaps.**—The spark plug gaps are .028 to .030 inch.
- Oiling.**—Put 5 or 6 drops of light engine oil in oiler on side of distributor housing every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.
- Starter-Generator.**—Starter and generator are combined into one unit, but are electrically separate. Starter is connected to the engine through a set of reduction gears and a pinion shifted by the operator. Two overrunning clutches are provided. In connection with the ignition switch, a circuit is closed allowing a current flow through the generator windings, causing the armature to revolve slowly, facilitating the meshing of the reduction gears. One clutch permits this rotation, and also permits a relatively high speed of the armature, necessary when operating as a starter. The second overrunning clutch prevents the engine from driving the armature through the reduction gears. Depressing the starting pedal meshes the reduction gears, opens the generator circuit, and allows the motor brushes to come in contact with the commutator, closing the starter circuit and cranking the engine. When the pedal is released, a spring reverses these operations.
- Generator.**—Generator current regulation is by third brush system.

GENERATOR DATA. MOTOR-GENERATOR No. 68

Amperes	R. P. M.
Neutral	375
4-10	505
16-20	1000
10-15	1500
9-13	1800

Operating as a motor with the overrunning clutch as the only retarding force, generator draws 4.5 amperes.

Oiling.—Put 5 or 6 drops of light engine oil in generator oiler every two weeks. At the same time turn down the grease cup on the rear end two turns. If car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles. The distributor driving gear housing is packed with soft cup grease which should be renewed every six months.

Relay.—There is no relay. The circuit between generator and battery is controlled by the ignition switch. An overrunning clutch at driving end allows generator to operate as a motor when battery's pressure is greater than that of generator, thereby reducing the discharge current from the battery. The noise of the overrunning clutch is intended to attract the operator's attention to open the ignition switch. The opening and closing of the generator-battery circuit by the operator takes the place of the relay.

Lamps.—Head lamps are 6-8 volt, 14 cp. Dash and tail lamps are each 6-8 volt, 2 cp.

Circuit-Breaker.—There is a vibrating circuit breaker on the back of the combination switch to take the place of fuses in the lighting circuits. It requires a current of 25 amperes to start this device vibrating, but once vibrating, 3 to 5 amperes will cause it to continue.

Model Numbers.—Motor-generator is No. 68. Ignition coil is No. 2118. Combination switch is No. 1058 or 1067.

2 lb. ft.	1450-1600	120-140	4.9-5.2		6 lb. ft.	850-950	290-310	4.5-4.6	
5 lb. ft.	750-900	225-250	4.6-4.9		14 lb. ft.	Lock	570-600	3.0	

Oiling.—Put 5 or 6 drops of light engine oil in each of starter bearing oilers every month.

Generator.—Generator current regulation is by vibrating regulator.

GENERATOR DATA

Model No. 18-A				Model No. 18-C-D			
Ampers	R. P. M.	Volts		Ampers	R. P. M.	Volts	
0	370	6.0		0	365	6.0	
7	490	6.5		7	510	6.3	
14.2	2200	6.9		14.5	1450	6.8	

Operating freely as a motor, current is 4 to 4.5 amperes at 5.8 volts. Speed is 420 R. P. M. Shunt field current is 3 to 3.5 amperes at 5.9 volts. Maximum output is reached at 22-26 miles per hour.

Oiling.—Put 5 or 6 drops of light engine oil in each of generator bearing oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Relay-Regulator.—Relay closes at 6-8 miles per hour and opens at 4-6 miles per hour. The air gap between relay armature (moving member) and coil core is .012 to .015 inch, contacts closed. Contacts separate .012 to .015 inch. Clean relay and regulator contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sand paper. Remove all grit. Adjust before again putting into service. Increase spring tension on regulator armature to increase output, and decrease spring tension to decrease output.

Lamps.—Head lamps are 6-8 volt, 15 cp. Dash and tail lamps are each 6-8 volt, 2 cp.

Fuses.—Fuse on relay-regulator base is 15 ampere. Other fuses are 4 ampere.

Plate No. 104

White

MODEL GM (1917-18)

LEECE-NEVILLE GENERATING, STARTING AND LIGHTING SYSTEM EISEMANN MAGNETO IGNITION

BATTERY.—Battery is 12 volt, 75 ampere-hour. The two wire system is used.

IGNITION.—Magneto Model E.M. Breaker contacts separate .012 to .014 inch. When condition of points affects the ignition, resurface with a fine flat jeweler's file or worn No. 00 sandpaper.

OILING.—Put 2 or 3 drops of light machine oil in each of magneto oilers every month. If car is driven more than 1000 miles in a month, oiling must be done every 1000 miles.

TIMING.—Breaker contacts begin to separate when piston entering stroke is on top dead center, spark control and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 3, 4, 2.

SPARK PLUG GAPS.—Spark plug gaps are .025 inch.

STARTER.—Starter is connected to engine through a Bendix drive.

OILING.—Put 3 or 4 drops of light engine oil in each of starter oilers every month.

GENERATOR.—Generator current regulation is by third brush system. Maximum charging rate of 10 amperes is reached at 18 miles per hour. Maximum generator current output must never be made to exceed 12 amperes. Charging rate is varied by moving third brush. Moving third brush in direction of armature rotation increases charging rate. Moving it in opposite direction decreases charging rate. Brush is moved by turning nut on front end of generator.

OILING.—Put 5 or 6 drops of light engine oil in each of generator oilers every two weeks. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.

RELAY.—Relay closes at 7 and opens at 5 miles per hour. Charging current is 1 to 1.5 amperes at closing and the discharge current 0 to 1 ampere at opening of relay. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 12-16 volt, 21 cp. Dimmer lamps are 12-16 volt, 4 cp. Spot light is 12-16 volt, 7 cp. Dash lamp is 12-16 volt, 2 cp. Dome lamp is 12-16 volt, 2-4 cp. Tonneau lamp is 12-16 volt, 2 cp. Tail lamp is 12-16 volt, 2 cp.

Locomobile

Models 30, 38 and 48 (1911-12-13)
Rushmore Generating and Lighting System
Bosch Ignition

- Battery.**—Battery is 6 volt, 130 ampere-hour. The two wire system is used.
- Ignition.**—Type ZR Dual Magneto. Breaker contacts separate .014 to .016 inch. When the condition of the points affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sand paper.
- Timing.**—Breaker contacts begin to separate when piston on compression stroke is 5/16 to 7/16 inch from top dead center, spark control lever and breaker assembly in the fully advanced position.
- Firing Order.**—The firing order of the 4 cylinder cars is 1, 2, 4, 3. The firing order of the 6 cylinder cars is 1, 5, 3, 6, 2, 4.
- Spark Plug Gaps.**—Spark plug gaps are .027 to .028 inch on inlet side and .022 to .023 inch on exhaust side.
- Starter.**—No starter is provided.
- Generator.**—Generator current regulation is by reverse series field and a regulating resistance. This regulating resistance is connected in shunt with the reverse series field. When cold, this unit has a very small resistance, but when hot it has a greatly increased resistance. When cold, it forms practically a short circuit across the series field terminals, allowing but little current to flow through the series field. As the current through the resistance increases, the temperature and resistance increases, causing more current to flow through the reverse windings, reducing the output. As the resistance of the regulating coil increases in proportion to the current through it, the output is held practically constant at speeds above that necessary to produce the maximum output. The output is changed by changing the regulating resistance unit. The maximum charging rate of 20 amperes is reached at 25 miles per hour.
- Oiling.**—Put several drops of light engine oil in each of the generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.
- Relay.**—Relay closes at 8-10 miles per hour and opens at 6-8 miles per hour. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sand paper. Remove all grit. Adjust before again putting into service.
- Lamps.**—Head lamps are 6-8 volt, 24 cp. Side lamps are 6-8 volt, 2 cp. Tail lamp is 6-8 volt, 2 cp. Dash lamp is 6-8 volt, 2 cp.
- Fuses.**—A 4 ampere fuse mounted on switch panel protects the shunt field.

Bosch Two-Spark Dual Magneto Ignition System

Car Wiring.

Ignition Circuits

Plate No. 106

Locomobile MODELS 30, 38 AND 48 (1913) ADLAKE GENERATING AND LIGHTING SYSTEM BOSCH IGNITION

BATTERY.—Battery is 6 volt, 120 ampere-hour. The two wire system is used.
IGNITION.—Bosch ZR6 Dual. Breaker contacts separate .014 to .016 inch. When the condition of the points affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Put two or three drops of light engine oil in each of magneto oilers every 500 miles. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

TIMING.—Magneto contacts begin to separate when top dead center mark on fly-wheel is at indicator, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order of the Model 30 is 1, 2, 4, 3. The firing order of the Models 38 and 48 is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .028 to .030 inch.

GENERATOR.—Generator current regulation is by automatic field rheostat, operated by a solenoid connected in series with the charging circuit. Charging rate may be increased to meet winter driving conditions by pulling out the switch handle in the upper left-hand corner of the instrument panel. Pulling out this switch short-circuits a part of the solenoid winding, retarding the action of the automatic field rheostat and increasing the charging rate. Generator current output can be varied by changing the amount of bird shot in the piston of the dash pot. Maximum current output must not exceed 12 amperes.

OILING.—Pour 30-40 drops of light engine oil in the oil hole on top of the generator every month. If car is driven more than 1000 miles in a month, the oiling must be done every 1000 miles.

RELAY.—Relay closes at 8-10 and opens at 6-8 miles per hour. Relay contacts separate 1/16 inch. The air gap between the poles, contacts closed, is .015 inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

CARE OF REGULATOR.—Inspect and clean the regulating apparatus every month. Be careful not to alter the adjustment. Wipe the dashpot and piston with a cloth moistened with gasoline. Do not oil. Clean rheostat segments and spaces between them. Put one drop of light engine oil on the bearings of the pulley wheel.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Side lamps are 6-8 volt, 6 cp. Tail lamp is 6-8 volt, 3 cp. Reading lamps, dome lamp and pillar lamps are 6-8 volt, 6 cp.

FUSES.—Shunt field fuse is 5 ampere. Main circuit fuse is 10 ampere. Both are mounted in the instrument panel. Other fuses are 10 ampere.

Westinghouse Generating, Starting and Lighting System
Bosch or Eisemann Magneto Ignition

Plate No. 107

BATTERY:—Battery is 6 volt, 120 ampere-hour. The positive (+) terminal is grounded.

IGNITION:—Eisemann, Type E.M.-6 Dual. and Bosch, Type ZR-6, Dual Model 4. Breaker contacts separate .015 inch. When the condition of the points affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING:—Put several drops of light engine oil in each of magneto oilers every month. If car is driven more than 1000 miles in a month, oiling must be done every 1000 miles.

TIMING:—Breaker contacts begin to separate when piston on compression stroke is 5/16 inch from the top of the stroke on Model 38, and 7/16 inch from the top of the stroke on the Model 48, spark control lever and breaker assembly in the fully advanced position.

FIRING ORDER:—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS:—Spark plug gaps are .028 inch.

STARTER:—Frame 775, Style 241,820. Starter is connected to the engine through a magnetic pinion shift.

Starter Data

Torque	R.P.M.	Amperes	Volts
4.0 lb. ft.	1000	160	5.6
12.0 lb. ft.	490	320	4.8
22.5 lb. ft.	Lock	500	4.5

Starter cranks the engine at 125 R. P. M. on the Model 38, and at R. P. M. on the Model 48.

OILING:—Put 4 or 5 drops of light engine oil in each of starter oilers every month.

GENERATOR:—Frame No. 520. Generator current regulation is by reverse series field.

Generator Data

Charging Rate	Total Output—Amperes	R.P.M.
4.4	7.6	500
8.0	12.0	800
10.0	13.6	1200
11.0	14.4	1600

The current for the lights does not pass through the reverse series field. When the lamps are turned on, the current output automatically increases to supply the extra current used, keeping the charging rate practically constant. Maximum charging rate is reached at 20-25 miles per hour.

OILING:—Put 4 or 5 drops of light engine oil in each of generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY:—Relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS:—Head lamps are 6-8 volt, 21 cp. Dimmer lamps are 6-8 volt, 6 cp. Tail lamp is 6-8 volt, 4 cp. Cowl, tonneau and step lamps are each 6-8 volt, 2 cp. Trouble lamp is 6-8 volt, 6 cp.

REMY GENERATING, STARTING AND LIGHTING SYSTEM

REMY IGNITION

BATTERY.—Battery is 6 volt, 100 ampere-hour. The two-wire system is used.

IGNITION.—Breaker contacts separate .018 to .023 inch. They are made of tungsten. When the condition of the points affects the ignition, renew the inner breaker mechanism. For temporary service, resurface contacts with fine emery cloth.

OILING.—Refill the cup under the breaker head with pure vaseline and turn down every month. If car is driven more than 1000 miles in a month, this must be done every 1000 miles. Do not put grease or oil in the cup.

TIMING.—Breaker contacts begin to separate when mark "UDC 1-4" on flywheel of 4 cylinder cars is $\frac{1}{2}$ inch before indicator, or when mark "UDC 1-6" on flywheel of 6 cylinder cars is one inch past indicator, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order of 4 cylinder cars is 1, 3, 4, 2. The firing order of 6 cylinder cars is 1, 4, 2, 6, 3, 5.

SPARK PLUG GAPS.—Spark plug gaps are .027 to .030 inch.

STARTER.—Model No. 300-A, -B. Starter is connected to engine through a set of reduction gears, driving chain and a ratchet clutch.

Starter Data

Torque	R.P.M.	Amperes	Volts
1 lb. ft.	780	65	6.0
3 lb. ft.	600	90	5.9
6 lb. ft.	460	120	5.7
8 lb. ft.	400	140	5.6
10 lb. ft.	360	160	5.5
68 lb. ft.	Lock	585	3.3

OILING.—Put several drops of light engine oil in each of starter bearing oilers every month. Remove plug and replenish grease in reduction gear case every six months.

GENERATOR.—Models No. 254-A and 256-A. Generator current regulation is by third brush system. A thermostat located in the brush rigging of the generator cuts in a resistance at a temperature of 175°F., reducing the maximum charging rate 6 amperes. Resistance also acts as a shunt field fuse. The thermostat is intended to change the charging rate as demand of seasons or car operation requires. Never touch the thermostat points.

High Battery			Generator Data			Low Battery		
Amperes	R.P.M.	Volts	Amperes	R.P.M.	Volts	Amperes	R.P.M.	Volts
0	350	6.40	0	330	5.90	0	330	5.90
7	510	7.13	7	500	6.24	7	500	6.24
13	690	7.76	13	680	6.58	13	680	6.58
20	1100-1500	9.00	18	1000-1200	6.84	18	1000-1200	6.84

Field current is 5 amperes at 6.4 volts. Operating freely as a motor, current is 4.75 amperes at 6.4 volts. armature turning at 245 R.P.M.

OILING.—Put several drops of light engine oil in each of generator oilers every two weeks. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.

RELAY.—Relay closes at 7-9 miles per hour or 350-400 R.P.M. of armature, and opens at 5-7 miles per hour or 300-350 R.P.M. of armature. Charging current at closing is 1 to 3 amperes and the discharge current 0 to 1 ampere at opening of relay. Contacts separate .012 to .015 inch. Air gap between relay armature and coil core is .012 to .015 inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 15 cp. Dash and tail lamps are in series. They are each 3-4 volt, 2 cp.

FUSES.—Fuses are 5 ampere.

Plate No. 110

APPERSON MODELS 6-16, 8-16 (1916) AND 6-17, 8-17 (1917) BJUR GENERATING, STARTING AND LIGHTING SYSTEM REMY IGNITION

BATTERY.—Battery is 6 volt, 80 ampere-hour. The two-wire system is used.

IGNITION.—Breaker contacts separate .020 to .025 inch. When condition of contacts affects ignition, resurface with a fine flat jeweler's file or worn No. 00 sandpaper.

OILING.—Refill the cup under the distributor head with soft cup grease and turn down two turns every two weeks. Put a small amount of vaseline on the fiber bumper of the contact arm, using a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when top dead center mark on flywheel is $\frac{1}{2}$ inch past indicator, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order of the six cylinder cars is 1, 5, 3, 6, 2, 4. The firing order of the eight cylinder cars is 1R, 4L, 3R, 2L, 4R, 1L, 2R, 3L.

SPARK PLUG GAPS.—Spark plug gaps are .025 to .030 inch.

STARTER.—Type E 68 M 357. Rotation is anti-clockwise, commutator end. Starter is connected to engine through a Bendix drive.

OILING.—Put several drops of light engine oil in each of starter bearing oilers every month.

GENERATOR.—Type L 61 M 303. Rotation is anti-clockwise, commutator end. Generator current regulation is by third brush system. Maximum generator output is 12-16 amperes. Output is varied by shifting third brush. Third brush is secured to generator by two stud bolts, the nuts of which appear in a recess in the front head of generator. Loosen these nuts with a socket wrench and shift the brush by gently tapping the shank of the wrench. Shifting brush in the direction of armature rotation will increase the output. Shifting brush in the opposite direction will decrease the output. Shifting the brush $\frac{1}{16}$ inch will vary the output 2 to 3 amperes. Tighten nuts after adjusting brush. Brush adjustment is made to give the desired rate with generator hot and charging a 3 cell battery reading 1.250 or above. There is a 20 ampere fuse in the small cap on generator housing to protect generator windings, should excessively high resistance occur in the charging circuits.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.

RELAY.—Relay closes at 10-12 miles per hour or 500-600 R.P.M. of armature, and opens at 8-10 miles per hour, or 450-500 R.P.M. of armature. The charging current is 1 to 3 amperes at closing, and the discharge current 0 to 1 ampere at opening of relay.

LAMPS.—Head lamps are 6-8 volt, 20 cp. Dash lamp is 6-8 volt, 2 cp. Tail lamp is 6-8 volt, 2 cp.

FUSES.—Fuses are 10 ampere.

Plate No. 111

Jordan

MODEL 60 (1917)

BIJUR GENERATING, STARTING AND LIGHTING SYSTEM BOSCH MAGNETO IGNITION

BATTERY.—Battery is 6 volt, 80 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Magneto breaker contacts separate .014 to .016 inch. When the condition of the points affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Put 2 or 3 drops of light machine oil in each of magneto bearing oilers and a very small amount of vaseline on fiber bumper of contact arm, applying with a toothpick, every month. If car is driven more than 1000 miles in a month, these attentions must be given every 1000 miles.

TIMING.—Magneto breaker contacts begin to separate when mark "1-6 DC" on flywheel is $\frac{5}{8}$ to $\frac{3}{8}$ inch before indicator, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .020 to .025 inch.

STARTER.—Type ED-160, Model 979, anti-clockwise rotation, commutator end. Starter is connected to the engine through a Bijur automatic gear shift, treated on Page 286.

OILING.—Put several drops of engine oil in each of starter oilers every month.

GENERATOR.—Type L-61, Model 832 or 1090, anti-clockwise rotation, commutator end. Generator current regulation is by third brush system. Maximum generator output is 12-16 amperes, reached at 20-25 miles per hour, or 1400-1600 R.P.M. of armature. Output is varied by shifting third brush. Third brush is secured to generator by two stud bolts, the nuts of which appear in a recess in the front head of generator. Loosen these nuts with a socket wrench and shift the brush by gently tapping the shank of the wrench. Shifting the brush in the direction of the armature rotation will increase the output. Shifting the brush in the opposite direction will decrease the output. Shifting the brush $\frac{1}{16}$ inch will vary the output 2 or 3 amperes. Tighten the nuts after adjusting the brush. Brush adjustment is made to give the desired rate with generator hot and charging a 3-cell battery, battery reading 1.250 or above. There is a 20 ampere fuse in the small aluminum cap on generator housing to protect the generator windings, should excessively high resistance occur in the charging circuit.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.

RELAY.—Relay closes at 10-12 miles per hour or 500-600 R.P.M. of armature. and opens at 8-10 miles per hour or 450-500 R.P.M. of armature. The charging current is 1-3 amperes at closing and the discharge current 0-1 ampere at opening of relay.

LAMPS.—Head lamps are 6-8 volt, 18 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash lamp is 6-8 volt, 3 cp. Tail lamp is 6-8 volt, 3 cp.

FUSES.—Fuses are 20 ampere.

AUTO-LITE MOTOR AND GENERATOR
DIXIE MAGNETO

Plate No. 112

OVERLAND

MODEL 86 (1916). BEFORE SERIAL NO. 2150 AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM DIXIE IGNITION

BATTERY.—Battery is 6 volt, 100 ampere-hour. The negative (—) terminal is grounded at the starting motor.

IGNITION.—Dixie Magneto. Breaker contacts separate .020 inch. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Fill the oil cups with light engine oil every month. Apply one drop of oil to the breaker bar bearing. If the car is driven more than 1000 miles in a month, the oiling must be done every 1000 miles.

TIMING.—Breaker contacts begin to separate when the top dead center mark on the fly-wheel is $1\frac{1}{4}$ inches past the indicator, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .020 inch.

STARTER.—Model MD. Starter is connected to the engine through a Bendix drive or by a pinion shifted by the operator.

OILING.—Put 4 or 5 drops of light engine oil in the starter oilers every month. Thoroughly clean out and repack bearings with soft cup or ball bearing grease every six months.

GENERATOR.—Model GA. Generator current regulation is by reverse series field. Maximum charging rate is 16-18 amperes, reached at 3000-3750 R.P.M. of the armature.

Amperes	Generator Data	R.P.M.
5	_____	550- 650
10	_____	980-1120
12.5	_____	1365-1520
15	_____	1850-2400
16-18	_____	3000-3750

Charging rate may be varied slightly by changing the pressure of the brushes on the commutator. Running freely as a motor, generator takes 2 amperes, armature revolving at 200 R.P.M. Shunt field winding takes 1.4 amperes.

OILING.—Put 5 or 6 drops of light engine oil in the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 310-380 R.P.M. or 8-10 miles per hour, and opens at 250-310 R.P.M. of the armature or 6-8 miles per hour. Charging current is .5 to 1.5 amperes at closing and the discharge current 0-1 ampere at the opening of the relay contacts. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 15 cp. Dash and tail lamps are connected in series and are each 3-4 volt, 2 cp.

FUSES.—Fuses are 20 ampere.

MODEL TF (1916-17) (SERIAL NOS. 11504 TO 19108) REMY GENERATING, STARTING AND LIGHTING SYSTEM

MEA MAGNETO IGNITION

BATTERY.—Battery is 6 volt, 80 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Breaker contacts separate .014 to .016 inch. When the condition of the points affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Put two or three drops of light machine oil in each of magneto oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

TIMING.—Breaker contacts begin to separate when piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 2, 4, 3.

SPARK PLUG GAPS.—Spark plug gaps are .015 to .020 inch.

STARTER.—Starter is connected to the engine through a Bendix drive.

Starter Data. Model No. 184A

Torque, Lb. Ft.	R. P. M.	Amperes	Volts
1	800-1000	55- 65	5.9-6.1
2	650- 900	65- 80	5.8-5.9
4	550- 675	95-115	5.6-5.8
6	450- 550	120-150	5.5-5.7
10	350- 400	175-200	5.3-5.5
13-16	Lock	580-620	4.0-4.2

GENERATOR.—Generator current regulation is by vibrating regulator.

Generator Data. Model 16A

Amperes	R. P. M.	Volts
0.0	370	6.0
7.0	490	6.5
14.2	2200	6.9

Maximum output is reached at 25 miles per hour. Operating freely as a motor, generator takes 4 to 4.5 amperes at 5.8 volts and runs at 430 R. P. M. Shunt field takes 3 to 3.5 amperes at 5.9 volts.

OILING.—Put 4 or 5 drops of light engine oil in generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY-REGULATOR.—Model No. 60A. Relay closes at 6-8 miles per hour and opens at 4 to 6 miles per hour. The air gap between relay armature (moving member) and coil core is .012 to .015 inch, contacts closed. Clean relay and regulator contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service. Increase spring tension on regulator armature to increase output, and decrease spring tension to decrease output.

LAMPS.—Head lamps are 6-8 volt, 15 cp. Dash and tail lamps are each 6-8 volt, 2 cp.

FUSES.—There is a 15 ampere fuse on relay-regulator base. Use commercial 15 ampere fuse in replacing it. Other fuses are 4 ampere.

Plate No. 114

Plate No. 115

Splitdorf

TWO UNIT GENERATING, STARTING AND LIGHTING SYSTEM

BATTERY.—Battery is 6 volt, 80-120 ampere-hour. The positive (+) terminal is grounded when the grounded system is used.

STARTER.—Starter is connected to engine through a Bendix drive.

OILING.—Put several drops of light engine oil in each of starter bearing oilers every month.

GENERATOR.—Generator current regulation is by a vibrating regulator. Internal circuits of generator and regulator are shown below. Maximum generator current is 15 amperes.

OILING.—Put several drops of light engine oil in each of generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY-REGULATOR.—Relay and regulator are combined in one unit. Relay closes at 7-9 and opens at 5-7 miles per hour. Charging current is 1-3 amperes at closing and the discharge current 0.1 ampere at opening of relay. Clean relay and regulator contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 15-21 cp. Dash lamp is 6-8 volt, 2-4 cp. Tail lamp is 6-8 volt, 2-4 cp.

FUSES.—Fuse is 15 ampere.

Plate No. 116

SPLITDORF-APELCO SINGLE UNIT 12-6 VOLT GENERATING, STARTING AND LIGHTING SYSTEM

BATTERY.—Battery is 12 volt, 35 to 70 ampere-hour. The negative (—) terminal of one set of three cells is grounded at the starting switch on cars using single wire lighting system.

STARTER.—Starter and generator are combined to form a single unit. Armature is permanently chain connected to engine crank shaft. Switch changes battery connections, connecting the two halves in series to supply 12 volts to starter and in parallel for charging at 6 volts. Internal connections of switch and generator are shown in diagram. When starting pedal is depressed, current flows from the terminal marked +A on the battery to +A on starting switch, through switch to +M and to +M on motor, through motor to —D on motor, to —B—D on switch, to —B on battery, through battery to +B on battery, then to +B on switch, through switch to —A, then to —A on battery and through battery, returning to +A, the starting point. Abnormal wear of brushes may be due to starting switch pedal sticking in hole in floor boards.

GENERATOR.—Generator current regulation is by reverse series field. Generator current is 15 amperes at 1500 R.P.M. When relay closes, current flows from +D (See diagram) on generator to +D on relay, through relay windings and contacts and out at +B on relay, then to +A on starting switch where it divides, one side leading to +A on battery, through battery to —A on starting switch. The other part of the current flows through a jumper in switch to +B on starting switch, through to +B on battery, on through battery to —B on starting switch. It will be noted that the common points of the current at the starting switch are —B—D, from which the current flows to —D on generator. If it is necessary to operate generator with battery disconnected, connect terminal —D and +D on generator to prevent burning out of windings and lamps.

RELAY.—Cutout relay closes at 7-9 miles per hour and opens at 5-7 miles per hour. Charging current is 1-3 amperes at closing and the discharge current 0 to 1 ampere at opening of relay. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 14-21 cp. Dash lamp is 6-8 volt, 2 cp. Tail lamp is 6-8 volt, 2 cp.

FUSES.—Fuse on back of relay-indicator is 20 ampere.

FUSES.—Fuse on back of relay is 15 ampere.

Plate No. 118

Pullman MODEL (1915)

SPLITDORF-APELCO GENERATING, STARTING AND LIGHTING SYSTEM CONNECTICUT IGNITION

BATTERY.—Battery is 12 volt, 50 ampere-hour. The middle connector is grounded to supply 6 volts to ignition and horn.

IGNITION.—Breaker contacts separate .023 inch. They are made of tungsten. When the condition of the points affects the ignition, renew the inner breaker mechanism. For temporary service, resurface with fine emery cloth.

OILING.—Refill the cup under the breaker head with pure vaseline and turn down every month. If car is driven more than 1000 miles in a month this must be done every 1000 miles. Do not put grease or oil in the cup.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 2, 4, 3.

SPARK PLUG GAPS.—Spark plug gaps are .025 to .030 inch.

STARTER-GENERATOR.—Starter and generator are combined into one unit. Armature is permanently chain connected to engine crank shaft.

GENERATOR.—Generator current regulation is by reverse series field. Maximum charging current is 8 amperes at 20-25 miles per hour.

OILING.—Put several drops of light engine oil in each of starter generator oilers every two weeks. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.

RELAY.—Cutout relay closes at 7-9 miles per hour and opens at 5-7 miles per hour. Charging current is 1-3 amperes at closing and the discharge current at 0 to 1 ampere at opening of relay. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 12-16 volt, 15 cp. Dimmer or side lamps are 12-16 volt, 4 cp. Dash lamp is 12-16 volt, 2 cp. Tail lamp is 12-16 volt, 2 cp.

FUSE.—Fuse is 15 ampere.

HOLLIER
"EIGHT"

ATWATER KENT IGNITION

Plate No. 119

HOLLIER

MODELS 158, 168, 178, 188 (1915, 16, 17, 18)

SPLITDORF-APELCO GENERATING, STARTING AND LIGHTING SYSTEM ATWATER KENT IGNITION

BATTERY.—Willard, 6-12 volt, 45 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Type K-2. Contacts separate .010 to .012 inch. They are made of tungsten. When the condition of the points affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

Oiling.—Put a drop of light machine oil on each of the wearing parts of breaker, and 4 or 5 drops of light machine oil in the oil hole beside the notched shaft, every two weeks. Put a very small amount of vaseline on the notched shaft, applying with a toothpick. If car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

Timing.—Contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—Cylinders are numbered from front to rear. Left hand bank (viewed from the drivers seat) are 1, 2, 3, 4, and the right hand bank are 5, 6, 7, 8. Firing order is 1, 6, 3, 5, 4, 7, 2, 8.

Spark Plug Gaps.—Spark plug gaps are .020 inch.

STARTER-GENERATOR.—Type A-25. Starter is chain connected to engine crank shaft. The starting switch changes battery connections, connecting the two halves in series for starting, and in parallel for charging.

GENERATOR.—Generator current regulation is by reverse series field. Generator delivers 15 amperes at 1500 R.P.M. If it is necessary to operate generator with battery disconnected, connect terminal —D and +D on generator to prevent burning out of windings and lamps.

Oiling.—Put several drops of light engine oil in each of the generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Cutout relay closes at 7-9 miles per hour and opens at 5-7 miles per hour. Charging current is 1-3 amperes at closing and the discharge current 0-1 ampere at opening of relay. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dash and tail are 3-4 volt, 2cp. They are in series.

FUSES.—Fuse on back of indicating automatic switch (relay) is 15 ampere.

Plate No. 121

HERFF BROOKS MODEL 4-35 AND H-6-50 (1916) SPLITDORF 6-12 VOLT GENERATING, STARTING AND LIGHTING SYSTEM DIXIE MAGNETO IGNITION

BATTERY:—Battery is 12 volt, 45 ampere hour. The negative (—) terminal is grounded

IGNITION:—Magneto breaker contacts separate .020 inch. When condition of contacts affects ignition, resurface with fine flat jeweler's file or worn No. 00 sandpaper.

OILING:—Fill the oil cups with light engine oil every month. Apply one drop of oil to the breaker bar bearing. If the car is driven more than 1000 miles in a month, the oiling must be done every 1000 miles.

TIMING:—Breaker contacts begin to separate when piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER:—The firing order is 1, 3, 4, 2.

SPARK PLUG GAPS:—Spark plug gaps are .025 to .028 inch.

STARTER:—Starter and generator are combined into one unit. Armature is permanently chain connected to engine crank shaft.

GENERATOR:—Generator current regulation is by reverse series field. Maximum charging current of 15 amperes is reached at 1500 R.P.M. of armature, or 20-25 miles per hour.

OILING:—Put several drops of light engine oil in each of starter-generator oilers every two weeks. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.

RELAY:—Cutout relay closes at 7-9 miles per hour and opens at 5-7 miles per hour. Charging current is 1-3 amperes at closing and the discharge current 0 to 1 ampere at opening of relay. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS:—Head lamps are 6-8 volt, 15 cp. Dash lamp is 3-4 volt, 2 cp. Tail lamp is 3-4 volt, 2 cp.

FUSE:—Fuse on back of indicating relay is 15 ampere.

MITCHELL-LEWIS

1916 MODEL

SPLITDORF-APELCO GENERATING, STARTING AND LIGHTING SYSTEM CONNECTICUT IGNITION

BATTERY.—Battery is 12 volt, 65 ampere-hour. The two-wire system is used.

IGNITION.—Breaker contacts separate .023 inch. They are made of tungsten. When the condition of the points affects the ignition, renew the inner breaker mechanism. For temporary service, resurface contacts with fine emery cloth.

OILING.—Refill the cup under the breaker head with pure vaseline and turn down every month. If car is driven more than 1000 miles in a month, oiling must be done every 1000 miles. Do not put grease or oil in the cup.

TIMING.—Breaker contacts begin to separate when piston entering power stroke is on top dead center, spark control lever and breaker assembly in fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .025 to .030 inch.

STARTER-GENERATOR.—Starter and generator are combined into one unit. Armature is permanently chain connected to engine crank shaft.

GENERATOR.—Generator current regulation is by reverse series field. Maximum charging current of 15 amperes is reached at 1500 R.P.M. of armature, or 20-25 miles per hour.

OILING.—Put several drops of light engine oil in each of starter-generator oilers every two weeks. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.

RELAY.—Cutout relay closes at 7-9 miles per hour and opens at 5-7 miles per hour. Charging current is 1-3 amperes at closing and the discharge current 0 to 1 ampere at opening of relay. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 15 cp. Dash lamp is 6-8 volt, 2 cp. Tail lamp is 6-8 volt, 2 cp.

FUSE.—Fuse on back of indicating relay is 15 ampere.

1916 MODEL

SPLITDORF GENERATING, STARTING AND LIGHTING SYSTEM

DELCO IGNITION

BATTERY.—Battery is 12 volt, 35 ampere-hour. The negative (—) terminal is grounded at the starting switch.

IGNITION.—Breaker contacts separate .018 to .023 inch. They are made of tungsten. When the condition of the points affects the ignition, remove and resurface with fine emery cloth or against the side of an emery wheel, finishing on a hard oil stone.

OILING.—Put 3 or 4 drops of light engine oil in timer bearing oilers every two weeks. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 3, 4, 2.

SPARK PLUG GAPS.—Spark plug gaps are .027 to .030 inch.

STARTER-GENERATOR.—Starter and generator are combined into one unit. Armature is permanently chain connected to engine crank shaft.

GENERATOR.—Generator current regulation is by reverse series field. Maximum charging rate of 15 amperes is reached at 1500 R.P.M. of armature, or 20-25 miles per hour.

OILING.—Put several drops of light engine oil in each of starter-generator oilers every two weeks. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.

RELAY.—Cutout relay closes at 7-9 miles per hour and opens at 5-7 miles per hour. Charging current is 1-3 amperes at closing and the discharge current 0 to 1 ampere at opening of relay. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No.00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 15 cp. Dash lamp is 6-8 volt, 2 cp. Tail lamp is 6-8 volt, 2 cp.

FUSE.—Fuse on back of indicator-relay is 15 ampere.

Plate No. 124 Briscoe, Model 4-38 (1916), Splitdorf-Apelco System, Connecticut Ignition
Internal circuits shown on Page 116.

Briscoe

MODEL 4-38 (1916)

SPLITDORF-APELCO GENERATING, STARTING AND LIGHTING SYSTEM CONNECTICUT IGNITION

BATTERY.—Battery is 12 volt, 60 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Breaker contacts separate .023 inch. They are made of tungsten. When the condition of the points affects the ignition, renew the inner breaker mechanism. For temporary service, resurface contacts with fine emery cloth.

OILING.—Refill the cup under the breaker head with pure vaseline and turn down every month. If car is driven more than 1000 miles in a month, this must be done every 1000 miles. Do not put grease or oil in the cup.

TIMING.—Breaker contacts begin to separate when the mark "1-4" on flywheel is at indicator, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 3, 4, 2.

SPARK PLUG GAPS.—Spark plug gaps are .027 to .030 inch.

STARTER-GENERATOR.—Starter and generator are combined into one unit. Armature is permanently chain connected to engine crank shaft.

GENERATOR.—Generator current regulation is by reverse series field. Maximum charging current of 15 amperes is reached at 1500 R.P.M. of armature, or 20-25 miles per hour.

OILING.—Put several drops of light engine oil in each of starter-generator oilers every two weeks. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.

RELAY.—Cutout relay closes at 7-9 miles per hour and opens at 5-7 miles per hour. Charging current is 1-3 amperes at closing and the discharge current 0 to 1 ampere at opening of relay. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 12 cp. Dash lamp is 6-8 volt, 2 cp. Tail lamp is 6-8 volt, 2 cp.

FUSE.—Fuse on back of indicating automatic relay is 15 ampere.

SERVICE ENGINEERING COMPANY, SAN FRANCISCO—COPYRIGHTED, 1926

DORT MODEL 6, 9, 9S AND 9T (LATE 1917)

MODEL 11 (1918) (SERIAL NOS. 24,369 AND UP) WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM CONNECTICUT IGNITION

BATTERY.—Battery is 6 volt, 80 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Breaker contacts separate .023 inch. They are made of tungsten. When the condition of the points affects the ignition, renew the inner breaker mechanism. For temporary service, resurface contacts with fine emery cloth.

OILING.—Refill the cup under breaker head with pure vaseline and turn down every month. If car is driven more than 1000 miles in a month, this must be done every 1000 miles. Do not put grease or oil in the cup.

TIMING.—Breaker contacts begin to separate when the mark "1 and 4DC" on flywheel is 1 inch past indicator, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 3, 4, 2.

SPARK PLUG GAPS.—Spark plug gaps are .025 inch.

STARTER.—Frame No. 100. Starter is connected to engine through a Bendix drive. Torque at 1500 R. P. M. of armature is 1 3/4 pound-feet. Lock torque, 12 pound-feet current 475 amperes.

OILING.—Put several drops of light engine oil in each of starter oilers every month.

GENERATOR.—Frame No. 760. Generator current regulation is by third brush system. Current output is varied by adjustment of third brush setting. Set the third brush so that at 1100-1500 R. P. M., the maximum output is 15 to 17 amperes at 7 1/2 volts. The cold test readings are obtained with the normal setting of third brush, and a generator temperature under 35° C. (95° F). The hot test readings are obtained after the generator has been operated one hour at 1800 R. P. M., charging a half-charged battery or its equivalent.

Generator Data

R. P. M.	Cold Test	
	Generator Output Amperes	Generator Voltage
500	0	6.5
1250	15-17	7.5
1250	12-14	6.5
2500	7-11	6.5-7.5

R. P. M.	Hot Test	
	Generator Output Amperes	Generator Voltage
1250	12-14	7.5
2500	7-11	6.5-7.5

Field current is 2.8 to 3.25 amperes, 6 volts. Field resistance is 1.9 to 2.25 ohms at 25° C (77° F.).

Field Test, Generator Operating

R. P. M.	Cold Test		Field Current
	Generator Output Amperes	Generator Voltage	
1250	12-15	7.5	1.55-2.2

Operating freely as a motor, current flow is 3.5 to 5 amperes, 6 to 6.6 volts.

OILING.—Put 5 or 6 drops of light engine oil in each of generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 8-10 miles per hour or 500-550 R. P. M. of armature, and opens at 6-8 miles per hour or 450-500 R. P. M. of armature. Charging current is 1 to 2 amperes at closing, and the discharge current 0 to 2 amperes at opening of relay. Air gap between relay armature (moving member) and coil core is .031 inch, contacts separated. Contacts separate .013 to .018 inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 15 cp. Dash lamp is 6-8 volt, 4 cp. Tail lamp is 6-8 volt, 2 cp. On 1917 cars, head lamps are 6-8 volt, 16 cp. Tail lamp is 6-8 volt, 4 cp.

FUSES.—Fuses are 10 ampere.

DORT

MODELS 4 AND 5 (1915)

SPLITDORF-APELCO 6-12 VOLT, GENERATING, STARTING AND LIGHTING SYSTEM

CONNECTICUT IGNITION

BATTERY.—Battery is 12 volt, 50 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Breaker contacts separate .023 inch. They are made of tungsten. When the condition of the points affects the ignition, renew the inner breaker mechanism. For temporary service, resurface contacts with fine emery cloth.

OILING.—Refill the cup under the breaker head with pure vaseline and turn down every month. If car is driven more than 1000 miles in a month, this must be done every 1000 miles. Do not put grease or oil in the cup.

TIMING.—Breaker contacts begin to separate when the mark "1-4 DC" on flywheel is at indicator, spark control advanced one inch on the quadrant.

FIRING ORDER.—The firing order is 1, 3, 4, 2.

SPARK PLUG GAPS.—Spark plug gaps are .027 to .030 inch.

STARTER.—Starter and generator are combined into one unit. Armature is permanently chain connected to engine crank shaft. Switch changes battery connections, connecting the two halves in series for cranking, and in parallel for charging. Lock torque is 30-40 pound-feet, current being 350 amperes at 9.4 volts.

GENERATOR.—Generator current regulation is by reverse series field. Generator current is 15 amperes at 1500 R.P.M. of the armature or 20 miles per hour.

RELAY.—Cutout relay closes at 7-9 miles per hour and opens at 5-7 miles per hour. Charging current is 1-3 amperes at closing and the discharge current 0 to 1 ampere at opening of relay. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 15 cp. Dash lamp is 6-8 volt, 2 cp. Tail lamp is 6-8 volt, 2 cp.

FUSE.—Fuse is 15 ampere.

Plate No. 126

Plate No.
Dort, Early 1915. Apelco Generator, No Starter

Plate No. 127

CUNNINGHAM **MODEL V, SERIES 1 (1916)** **SERIAL NOS. V-991 TO V-1297** **WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM** **WESTINGHOUSE IGNITION**

BATTERY.—Battery is 6 volt, 100 ampere-hour. The positive (+) terminal is grounded at the starting motor.

IGNITION.—Breaker contacts separate .008 inch. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper. Adjust the distributor brush springs so that the brushes extend 1/4 inch from their holders when the distributor cap is removed, but do not fall out. Brushes must move freely in their holders. See that the brushes on the top and bottom of the rotor are in place when installing rotor. Breaker lever arm spring tension should require a pull of 11.5 to 12.5 ounces applied to the contacts to open the contacts sufficiently to permit the cam to rotate freely.

OILING.—Put 2 or 3 drops of light engine oil in the oiler at the side of the ignition unit every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

BALLAST RESISTOR.—There is a ballast resistor in the ignition switch. A fuse must not be permanently substituted for this resistor. In case it is necessary to operate the car with the ballast defective, a 5 ampere fuse may be used temporarily, but the ballast must be replaced as soon as possible, as continued operation without it will result in serious burning of the breaker contacts. The resistor has a cold resistance of .43 to .47 ohm.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever 2 inches from the fully retarded position. (First see that the breaker assembly is fully retarded when the control lever is in the fully retarded position.) The breaker contacts are beginning to separate when the end of the distributor rotor is opposite the V notch on the rim of the case.

FIRING ORDER.—The firing order is 1R, 4L, 3R, 2L, 4R, 1L, 2R, 3L.

SPARK PLUG GAPS.—Spark plug are .023 to .027 inch.

STARTER.—Frame 502. Starter is connected to the engine through a set of reduction gears meshed by the operator. Lock torque is 16 pound-feet, current being 550 amperes. Torque at 1500 R.P.M. is 2 pound-feet.

OILING.—Put 5 or 6 drops of light engine oil in the starter oilers every month.

GENERATOR.—Frame 450-R. Generator voltage regulation is by vibrator regulator. Maximum output is 15 amperes at 6.8 volts, reached at 1200 R.P.M. of the armature or 20-25 miles per hour. Shunt field current is 2.75 to 3.5 amperes at 6 to 6.25 volts. Running freely as a motor, generator takes 4 to 5.5 amperes at 6 to 6.25 volts.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY-REGULATOR.—Relay and regulator are combined to form a single unit. Relay closes at 550-600 R.P.M. of the armature or 10-12 miles per hour and opens at 500-550 R.P.M. of the armature or 8-10 miles per hour. Relay closes when the voltage of the generator reaches 6.6 to 7 volts, and opens with a discharge current of 1 to 3 amperes. Regulator must be adjusted to limit the voltage to 6.5 volts with a 15 ampere resistance load at 1200 R.P.M. of the generator armature. Clean relay and regulator contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 24 cp. Side lamps are 6-8 volt, 5 cp. Dash and tail lamps are 6-8 volt, 2 cp. Dome and pillar lamps are 6-8 volt, 5 cp.

Plate No. 128

CUNNINGHAM

MODEL V, SERIES 2 (1917)

WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM

WESTINGHOUSE IGNITION

BATTERY.—Battery is 6 volt, 115 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Breaker contacts separate .006 inch. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper. Adjust the distributor brush springs so that the brushes extend $\frac{1}{4}$ inch from their holders when the distributor cap is removed but do not fall out. Brushes must move freely in their holders. See that the brushes on the top and bottom of the rotor are in place when installing the rotor.

OILING.—Put 3 or 4 drops of light engine oil in the oiler at the side of the ignition unit every month. If the car is driven more than 1000 miles in a month, the oiling must be done every 1000 miles.

BALLAST-RESISTOR.—There is a ballast resistor in the fuse box. A fuse must not be permanently substituted for this resistor. In case it is necessary to operate the car with the ballast defective, a 5 ampere fuse may be used temporarily, but the ballast must be replaced as soon as possible, as continued operation without it will result in serious burning of the breaker contacts. The resistor has a cold resistance of .43 to .47 ohms.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever 2 inches from the fully retarded position. (First see that the breaker assembly is fully retarded when the control lever is in the fully retarded position. The breaker contacts are beginning to separate when the end of the distributor rotor is directly opposite the V notch on the rim of the case.)

FIRING ORDER.—The firing order is 1R, 4L, 3R, 2L, 4R, 1L, 2R, 3L.

SPARK PLUG GAPS.—Spark plug gaps are .023 to .027 inch.

STARTER.—Frame No. 502. Starter is connected to the engine through a set of reduction gears meshed by the operator. Lock torque is 16 pound-feet, current being 550 amperes. Torque at 1500 R.P.M. is 2 pound-feet.

OILING.—Put 5 or 6 drops of light engine oil in the starter oilers every month.

GENERATOR.—Frame No. 256. Generator current regulation is by reverse series field. Maximum current output is 12-15 amperes, reached at 1500 R.P.M. of the armature or 20-25 miles per hour. Shunt field winding takes 1.5 to 2.5 amperes at 6 to 6.3 volts. Running freely as a motor, generator takes 2.5 to 3.5 amperes at 6.0 to 6.3 volts.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 380-430 R.P.M. of the armature or 7-9 miles per hour and opens at 330-380 R.P.M. of the armature or 5-7 miles per hour. Relay opens with a discharge current of 0.2 amperes. Relay closes when the voltage of the generator reaches 7.5 to 7.8 volts, battery disconnected.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Fender lamps are 6-8 volt, 5 cp. Dome and pillar lamps are 6-8 volt, 4 cp. Dash lamp is 6-8 volt, 3 cp. Tail lamp is 6-8 volt, 2 cp.

WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM

DELCO IGNITION

BATTERY.—Battery is 6 volt, 115 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Model No. 2162. Distributor Model No. 5178. Breaker contacts separate .018 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING.—Put 4 or 5 drops of light engine oil in each of the ignition unit oilers every two weeks. If the track of the rotor button in the distributor head is not well polished, apply a small amount of vaseline with a soft cloth. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever 2 inches from the fully retarded position. (First see that the breaker assembly is fully retarded when the control lever is in the fully retarded position. The breaker contacts are beginning to separate when the distributor rotor is directly opposite the V notch on the rim of the case.)

FIRING ORDER.—The firing order is 1R, 4L, 3R, 2L, 4R, 1L, 2R, 3L.

SPARK PLUG GAPS.—Spark plug gaps are .023 to .027 inch.

STARTER.—Frame No. 751. Starter is connected to the engine through a Bendix drive.

Starter Data		
Torque	R.P.M.	Amperes
2.5 lb. ft.	1450	140
5.0 lb. ft.	1150	200
10.0 lb. ft.	750	340
15.0 lb. ft.	560	460
17.5 lb. ft.	500	530
21.0 lb. ft.	Lock	650

OILING.—Put 5 or 6 drops of light engine oil in each of the starter oilers every month.

GENERATOR.—Frame No. 780-R. Generator voltage regulation is by combined magnetic and mechanical cam regulator. Maximum output of generator is 15 amperes at 6.5-7 volts, reached at 1800 R.P.M. of the armature or 25 miles per hour. On open circuit, generator voltage is 8.0 at 1800 R.P.M. To adjust the cam regulator, loosen the nut C and turn the screw D until the air gap between D and E is .003 inch, when the rider B is on the highest point of the cam A. Further adjustment to obtain the specified action is made by bending the stop F. Resistance of regulator winding is 10 ohms. Resistance of the part of the resistor which is in series with the regulator coil is 10 ohms. Resistance of the part of the resistor connected across the contacts is 30 ohms.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted in the generator frame. Relay closes at 400-450 R.P.M. of the armature or 6-8 miles per hour, and opens at 350-400 R.P.M. of the armature or 5-7 miles per hour. Adjust the armature stop so that relay contacts open when the discharge current is 0.3 amperes. Adjust spring tension so that relay closes when the voltage of the generator reaches 5.8 to 6.1 volts, battery disconnected. Air gap between relay armature and coil core is .005 inch, contacts closed. Contacts separate .012 to .018 inch. Resistance of the shunt coil with resistor is 56.5 ohms. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Fender lamps are 6-8 volt, 5 cp. Dome and pillar lamps are 6-8 volt, 4 cp. Dash lamp is 6-8 volt, 3 cp. Tail lamp is 6-volt, 2 cp.

FUSES.—Fuses are 20 ampere.

WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

CUNNINGHAM
MODEL V, SERIES 3 (1919)
WESTINGHOUSE STARTER AND GENERATOR
DELCO IGNITION

Plate No. 130

BATTERY.—Willard, Type SJR-5, 6 volt, 120 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Coil Model No. 2162. Distributor Model No. 5178. Breaker contacts separate .018 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oilstone.

OILING.—Put 4 or 5 drops of light engine oil in each of the ignition unit oilers every two weeks. If the track of the rotor button in the distributor head is not well polished, apply a small amount of vaseline with a soft cloth. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever 2 inches from the fully retarded position. (First see that the breaker assembly is fully retarded when the control lever is in the fully retarded position.)

FIRING ORDER.—The firing order is 1R, 4L, 3R, 2L, 4R, 1L, 2R, 3L.

SPARK PLUG GAPS.—Spark plug gaps are .030 inch.

STARTER.—Frame 751. Starter is connected to the engine through a set of reduction gears meshed by the operator. Starter cranks the engine at 85-90 R.P.M.

Starter Data

Torque	R.P.M.	Amperes
2.5 lb. ft.	1450	140
5.0 lb. ft.	1150	200
10.0 lb. ft.	750	340
15.0 lb. ft.	560	460
21.0 lb. ft.	Lock	650

OILING.—Put 4 or 5 drops of light engine oil in the starter oilers every month.

GENERATOR.—Frame 782-R. Generator current regulation is by vibrator regulator. Maximum current output is 20 amperes at 6.5 volts, reached at 725 R.P.M. of the armature or 25 miles per hour. Shunt field takes 1.25 to 1.75 amperes at 6 to 6.3 volts. Running freely as a motor, generator takes 5 amperes at 6 to 6.3 volts.

OILING.—Put 4 or 5 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY-REGULATOR.—Relay and regulator are combined to form a single unit. Relay closes at 10-12 miles per hour or 375-425 R.P.M. of the armature, and opens at 8-10 miles per hour or 325-375 R.P.M. of the armature. To adjust relay, regulate the spring tension until the relay opens with a discharge current of 1-2 amperes. Adjust the stop which determines the air gap between the armature and coil core until the relay closes with a generator voltage of 6.5 to 7 volts, battery disconnected. This air gap is .055 to .060 inch. To adjust the regulator, drive the generator at 1200 R.P.M. With a 20-ampere resistance load, the voltage must not exceed 6.5 volts. With no load, the voltage should be 8.5 volts. Adjust the regulator air gaps and spring tension until this action is obtained. Air gap between regulator armature and coil core is .045 to .055 inch. Clean relay and regulator contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Fender lamps are 6-8 volt, 5 cp. Dome and pillar lamps are 6-8 volt, 4 cp. Dash lamp is 6-8 volt, 3 cp. Tail lamp is 6-8 volt, 2 cp.

Plate No. 131

BRISCOE MODEL B-15 (1914-15) SPLITDORF GENERATING, STARTING AND LIGHTING SYSTEM SPLITDORF MAGNETO IGNITION

BATTERY.—Battery is 12 volt, 35 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Type EU-4-2. Breaker contacts separate .020 inch. When the condition of the points affects the ignition resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Put 2 or 3 drops of light engine oil in each of the magneto oilers every month. Put a small amount of vaseline on the cam, applying with a toothpick. If the car is driven more than 1000 miles in a month, these attentions must be given every 1000 miles.

TIMING.—Breaker contacts begin to separate when piston entering power stroke is on top dead center, spark control lever and breaker assembly in fully retarded position.

FIRING ORDER.—The firing order is 1, 3, 4, 2.

SPARK PLUG GAPS.—Spark plug gaps are .025 to .030 inch.

STARTER-GENERATOR.—Starter and generator are combined into one unit. The unit is connected to the engine by chain. Starter cranks the engine at 175 to 250 R.P.M. First inrush of current is 350 amperes, decreasing to 80 amperes as starter gains speed. Lock torque is 35-40 pound-feet, taking 350 amperes at 9.4 volts. Pressure of brushes on commutator is 8 to 14 ounces.

GENERATOR.—Generator current regulation is by reverse series field. Maximum current output is 12 to 15 amperes, reached at 1500 R.P.M. of the armature or 20 miles per hour. Shunt field current is $1\frac{1}{4}$ amperes at 12 volts.

OILING.—Put 5 or 6 drops of light engine oil in each of the starter-generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 10 miles per hour or 880 R.P.M. of the armature, and opens at 8 miles per hour or 770 R.P.M. of the armature. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamp is 6-8 volt, 20 cp. Side lamps are 12-16 volt, 4 cp. Tail lamp is 12-16 volt, 2 cp.

FUSES.—Fuse is 15 ampere.

Monroe

MODEL M-2 (1916) AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM CONNECTICUT IGNITION

BATTERY.—Battery is 6 volt, 70 ampere-hour. The negative (—) terminal is grounded through the motor frame.

IGNITION.—Breaker contacts separate .023 inch. When the condition of the points affects the ignition, renew the inner breaker mechanism. For temporary service resurface contacts with fine emery cloth.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 2, 4, 3.

SPARK PLUG GAPS.—Spark plug gaps are .027 inch.

OILING.—Refill the cup under the breaker head with pure vaseline and turn down every month. If car is driven more than 1000 miles in a month, this must be done every 1000 miles. Do not put grease or oil in the cup.

STARTER.—Starter is Model MF. Starter is connected to the engine through a Bendix drive. It takes 130-150 amperes when cranking the engine.

OILING.—Thoroughly clean out and repack starter bearings with soft cup or ball-bearing grease every six months. No oil is required.

GENERATOR.—Generator current regulation is by reverse series field.

Generator Data.. Model GB

2 Inch Diameter Armature		2½ Inch Diameter Armature	
Amperes	R. P. M.	Amperes	R. P. M.
5	1000-1250	5.0	985-1140
10	1950-2300	10.0	1625-1875
12	2500-3500	12.5	2125-2545
14-15	3500-4500	15.0	2725-3500

A variation of 1.5 amperes from these amounts is allowable. Output may be varied slightly by adjusting brush pressure. Brush pressure on commutator is 1 to 1¼ pounds. When operating freely as a motor, the generator with 2 inch armature takes 1.9 amperes, armature revolving at 450 R.P.M. The generator with 2½ inch armature, takes 1.7 amperes, armature revolving at 435 R. P. M. Shunt field of either machine should take 1 ampere.

OILING.—Put 4 or 5 drops of light engine oil in each of the generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done 500 miles.

RELAY.—Relay closes at 7 and opens at 5 miles per hour. Relay closes at 550-650 R.P.M., of 2 inch armature, or 525-625 R. P. M., of 2½ inch diameter armature. Charging current is .5 to 1.5 amperes at closing, and the discharge current 0 to 1 ampere at opening of relay. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

FUSE.—Fuse, on dash under cowl, is 20 amperes. ♂

Mercer, Series 22-72 (1916), U.S.L. Generating System, Bosch Ignition Plate No. 133
SERVICE ENGINEERING COMPANY, SAN FRANCISCO—COPYRIGHTED, 1926

Mercer

SERIES 22-72 (1916) (SERIAL NOS. 2550-3299)
U. S. L. GENERATING, STARTING AND LIGHTING SYSTEM
BOSCH IGNITION

BATTERY.—Battery is 12 volt, 80 ampere-hour. The negative (—) terminal is grounded.
IGNITION.—Bosch Type DU4. Breaker contacts separate .014 to .016 inch. When the condition of the points affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Put 2 or 3 drops of light machine oil in each of magneto oilers every month. If car is driven more than 1000 miles in a month, the oiling must be done every 1000 miles.

TIMING.—Breaker contacts begin to separate when piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 3, 4, 2.

SPARK PLUG GAPS.—Spark plug gaps are .018 to .023 inch.

STARTER-GENERATOR.—Starter and generator are combined into one unit. The armature is fastened direct to the crank shaft, taking the place of the flywheel. An electromagnetic starting switch is provided. When the button, marked "Start," on the dash is pressed in, the circuit through a solenoid is closed. The solenoid draws in an iron core which closes a sliding switch, thus completing the main motor circuit. The core of the solenoid is forced out by a spring when the "Start" button is released. The touring button must be pulled out to start. The three lower brushes are used when the unit is operating as a generator. The other five are used for the starter. Spring tension on the generator brushes is $1\frac{3}{4}$ pounds. Spring tension on the starter brushes is $1\frac{1}{4}$ pounds.

GENERATOR.—Generator current regulation is by reverse series field and a compensating field winding. Maximum current output is 18-20 amperes at 20-25 miles per hour. Charging rate may be varied by substituting a different resistance coil in the shunt field circuit. This resistance coil is mounted on the dash. The "Touring" button provides a means of cutting out the battery when it is fully charged. Pressing in the button opens the shunt field circuit and disconnects the battery from the generator.

RELAY.—Relay closes at 10 and opens at 8 miles per hour. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 12-16 volt, 24 cp. Dimmer lamps are 12-16 volt, 6 cp. Dash and tail lamps are each 12-16 volt, 6 cp.

FUSES.—There is a 30 ampere fuse in the charging circuit and a 5 ampere fuse in the field circuit. Lighting circuit fuses are 10 ampere.

Pierce-Arrow

1912

Bosch Magneto and Battery Ignition Systems

Battery.—Battery is 6 volt, 75 ampere-hour. The two wire system is used.

Magneto.—Bosch, Type D6. Breaker contacts separate .014 to .016 inch. When the condition of the points affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sand paper.

Battery Ignition.—The battery ignition system consists of a set of six high-tension coils, a master vibrator, a commutator for distributing the low tension current to the proper coil and a set of spark plugs. The master vibrator should be so adjusted that it takes the least possible current that will produce a satisfactory spark at high speed. Clean vibrator contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with worn No. 00 sand paper. Remove all grit. Adjust before again putting into service.

Oiling.—Put 2 or 3 drops of light machine oil in magneto oilers every two weeks. Lubricate the battery commutator and rotor with light engine oil. Refill the grease cup on the commutator shaft bearing and turn down two turns. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

Timing.—Magneto breaker contacts begin to separate when the top dead center mark on the flywheel is 4-13/16 inches before the indicator, spark control lever and breaker assembly in the fully advanced position. The timer rotor should just make contact with a segment when the top dead center mark on the flywheel is 10 1/2 inches past the indicator, spark control lever and timer housing in the fully retarded position. To time the battery spark turn the engine to the above position, spark lever fully retarded. Turn the ignition switch to the "Off" position and remove the high tension lead from the cylinder on power stroke and hold it about 1/8 inch from the cylinder. Then loosen the two set screws holding the rotor in place on the shaft and turn it so that it is making connection with the coil for cylinder on power stroke. Turn the ignition switch to the "B" position. If the system is in order a shower of sparks will pass across the gap between the high tension lead and the cylinder casting. Now turn the rotor so that if the spark lever is advanced the slightest bit or the rotor turned back, the spark will discontinue. Then tighten the set screws to hold the rotor firmly in place, and replace the spark plug lead.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—Spark plug gaps are .020 inch.

SERIES 1 (1913), 2 (1914) AND 3 (1915)

WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM BOSCH MAGNETO AND BATTERY IGNITION

BATTERY.—Exide, Type 3X-15-1, 6 volt, 120 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Bosch, Type ZR6. Breaker contacts separate .016 inch. When the condition of the points affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper. The battery ignition system consists of a set of six high tension coils, a master vibrator, a commutator for distributing the low tension current to the proper coil, and a set of spark plugs. The master vibrator should be so adjusted that it takes the least possible current that will produce a satisfactory spark at high speed. Clean vibrator contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

OILING.—Put 2 or 3 drops of light engine oil in magneto oilers every two weeks. Lubricate the battery commutator and rotor with light engine oil. Refill the grease cup on the commutator shaft bearing and turn down two turns. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

TIMING.—Magneto breaker contacts begin to separate when the top dead center mark on the flywheel is $4 \frac{13}{16}$ inches before the indicator, spark control lever and breaker assembly in the fully advanced position. The timer rotor should just make contact with a segment when the top dead center mark on the flywheel is $10 \frac{1}{2}$ inches past the indicator, spark control lever and timer housing in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUGS.—Spark plugs gaps are .020 inch.

STARTER.—Frame No. 501, Style 5W-164; or Frame No. 506, Style No. 196861. Starter is connected to engine through a magnetic pinion shift, controlled by a push button on the dash. When the starting button is pressed, the current flows from the positive terminal of the battery to the frame, through the ignition switch, the push button to the starting controller (or magnetic switch), through the winding of this switch to terminal "S" on the generator, through the armature and the series winding of the generator to terminal "B" on the generator, then to No. 1 connector on the junction box, then to the negative main terminal of the magnetic control switch and to the negative terminal of the battery, through the large lead, thus completing the circuit through the magnetic control switch, closing the contacts. This completes the circuit through the motor and the solenoid pinion shifting coil. When the circuit is completed, the current flows from the positive terminal of the battery to the ground, to the grounded terminal of the solenoid and to the positive terminal of the motor. The current through the solenoid attracts the iron plunger, drawing the pinion into mesh. Before the plunger has been attracted, the motor is in series with a resistance (Plate 202A) in the starting switch. As soon as the current is turned on, the motor is turned slowly, to aid the meshing of the gears. As the solenoid draws in the armature, the motor circuit is broken, the pinion is drawn into mesh and the motor circuit again completed, this time without the resistance in the circuit, thus applying the full pressure to the motor, cranking the engine. There is an overrunning clutch to prevent the engine driving the motor.

Diagram of Ignition System.

Plate No. 135

Pierce-Arrow SERIES 1 (1913), 2 (1914) AND 3 (1915) WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM BOSCH MAGNETO AND BATTERY IGNITION

Continued from preceding page.

STARTER—Continued.—The heavy winding shown in the solenoid, Plate No. 202A, is in series with the motor armature. As the speed of the motor increases, the current through the armature decreases, due to the back pressure produced by the motor increasing, thus cutting down the current in the heavy winding, reducing the magnetic pull of the solenoid and allowing the spring acting against the magnet to force the pinion out of mesh and opening the main cranking circuit. The starting button should be released as soon as the engine begins to run on its own power. As soon as the generator produces sufficient pressure to close the contacts, the terminal "S" of the generator is grounded through the relay. Should the starting button be pressed when the contacts are closed, the current flows from the grounded contact to the positive terminal of the battery, and tends to send current from terminal "S" of the generator to the battery through the starting switch button and the ignition switch. Hence if the button is pressed, the battery will be tending to send current in one direction and the generator in the opposite direction, over the same wire. Hence no current will flow, and should the button be pressed with the generator running at or above cut-in speed no harm can come, as the magnetic control switch will not operate. Should the apparatus fail to work when the starting button is depressed, relay contacts closed, see that the ignition switch key is inserted and turned and that the switch lever is on the "M-B" or "B" position, as the device is inoperative otherwise. If the ear is placed near the magnetic control switch, a sharp click will be heard when the starting button is pressed, if it is working properly. If no click is heard test for current at the terminals, starting button pressed in. If the terminals test O K, there is an open circuit in the windings or the switch is sticking. A sharp blow with a hammer on the side of the case will nearly always loosen it. Should there be any difficulty in meshing the gears, see that the distance between the pinion and the flywheel gear, when in the demeshed position, is correct. This distance should not vary any appreciable amount from 3/16 inch. Should the magnetic control switch close when the starting button is pressed, but the motor fail to operate, there may be an open circuit in either the motor or the pinion shifting switch, or the wires leading to them. To test the motor, run an insulated wire (No. 10 or larger) from the negative terminal of the battery to the main terminal on the motor. Should the motor spin rapidly, the pinion shift or switch is at fault. If the motor spins slowly, the battery is low, the terminals are defective, the commutator or brushes are defective, the bearings are tight or the armature winding may be grounded or short circuited.

STARTER DATA, FRAME NO. 501

Torque	R. P. M.	Amperes
2 lb. ft.	1000	80
4 lb. ft.	650	125
6 lb. ft.	450	165
8 lb. ft.	300	210
10 lb. ft.	200	250
13-14 lb. ft.	Lock	325

Oiling.—Put 5 or 6 drops of light engine oil in each of starter oilers every month.

Generator.—Frame No. 250, Style 171514-A on the Series 1 cars. Frame No. 251, Style 186757-A or Frame No. 520, Style 188196-A on the Series 2 and 3 cars. Generator current regulation is by reverse series field. Maximum current output is reached at 25 miles per hour.

GENERATOR DATA

Frame No. 251			Frame No. 520		
Charging Rate	Total Output	R. P. M.	Charging Rate	Total Output	R. P. M.
(No Lamps)			(No Lamps)		
3.6	8.0	500	4.4	7.6	500
7.6	13.8	1000	8.0	12.0	800
9.0	15.6	1500	10.0	13.6	1200
9.6	16.6	2000	11.0	14.4	1600
10.0	17.0	2500	11.2	14.8	2000

The current for the lights does not pass through the reverse series field, so when they are turned on the output automatically increases to supply the extra current used, keeping the charging rate practically constant. There is a switch mounted on the back of the junction box with "On" and "Off" positions. Place the switch in the "On" position when it is necessary to increase the charging rate.

Oiling.—Put 5 or 6 drops of light engine oil in each of generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Relay.—Relay closes at 360-400 R. P. M. of armature or 6-9 miles per hour, and opens at 320-360 R. P. M. of armature or 4-7 miles per hour. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sand paper. Remove all grit. Adjust before again putting into service.

Lamps.—Head lamps are 6-8 volt, 21 cp. Side lamps are 6-8 volt, 4 cp. Dash and trouble lamps are 6-8 volt, 4 cp. Tail lamp is 6-8 volt, 2 cp. Dome lamp is 6-8 volt, 6 cp. Pillar and tonneau lamps are 6-8 volt, 4 cp. Number illuminator is 6-8 volt, 2 cp.

PIERCE-ARROW

SERIES 4 (1916-17-18) AND SERIES 5 (1918)

WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM

BOSCH MAGNETO AND WESTINGHOUSE BATTERY IGNITION

BATTERY.—Battery is 6 volt, 120 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Bosch Type ZR6, Model 4. Magneto breaker contacts separate .014 to .016 inch. Battery breaker contacts separate .010 to .012 inch. When the condition of the points affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Put 2 or 3 drops of light machine oil in each of magneto oilers every two weeks. Put 3 or 4 drops of light engine oil in the oiler at the side of the generator and bracket on which the distributor is mounted. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

TIMING.—Magneto breaker contacts begin to separate when the "Magneto" mark on fly-wheel is at the indicator, spark control lever and breaker assembly in the fully retarded position. Battery breaker contacts begin to separate when the "Igniter" mark on fly-wheel is at indicator, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .025 to .030 inch.

STARTER.—Frame No. 775, Styles 238094 and 253100. Starter is connected to the engine through a magnetic pinion shift.

Starter Data.

Torque	R.P.M.	Amperes	Volts
4.0 lb. ft.	1000	160	5.6
8.0 lb. ft.	600	245	5.0
12.0 lb. ft.	490	320	4.8
16.0 lb. ft.	200	390	4.6
22.5 lb. ft.	Lock	500	4.5

OILING.—Put 5 or 6 drops of light engine oil in each of starter oilers every month.

GENERATOR.—Frame No. 246-R. Generator voltage regulation is by vibrator regulator. Maximum charging rate is 15-20 amperes at 1200 R.P.M. of armature or 24 miles per hour with discharged battery, decreasing to 4-9 amperes when battery becomes charged. Shunt field current is 1.5-2 amperes at 6-6.3 volts.

OILING.—Put 5 or 6 drops of light engine oil in each of generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY-REGULATOR.—Relay closes at 8-10 miles per hour and opens at 6-8 miles per hour. Clean relay and regulator contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Side lamps are 6-8 volt, 4 cp. Dash and trouble lamps are 6-8 volt, 4 cp. Tail lamp is 6-8 volt, 4 cp. Dome lamp is 6-8 volt, 6 cp. Pillar and tonneau lamps are 6-8 volt, 4 cp.

SERVICE ENGINEERING COMPANY, SAN FRANCISCO—COPYRIGHTED, 1926

Plate No. 139

NATIONAL SERIES AK (1917-18-19) BIJUR GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

BATTERY.—Battery is 6 volt, 100 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Breaker contacts separate .018 inch. They are made of tungsten. When the condition of the points affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard stone.

OILING.—Remove top cover and put 5 or 6 drops of light engine oil in each of the two oil holes exposed, and 5 or 6 drops in the top vertical bearing every two weeks. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles. Spiral gears and lower bearings are packed with soft cup or ball bearing grease. Repack every six months.

TIMING.—Contacts begin to separate when the piston entering power stroke is on top dead center, spark control one-third advanced.

FIRING ORDER.—The firing order is 1R, 6L, 5R, 2L, 3R, 4L, 6R, 1L, 2R, 5L, 4R, 3L.

SPARK PLUG GAPS.—Spark plug gaps are .030 inch.

STARTER.—Type E-68, M-727, or M-510. Clockwise rotation, commutator end. Starter is connected to the engine by a Bendix drive. When operating freely, starter takes 50 amperes, armature revolving at 2300 R.P.M. Lock torque is 36 pound-feet, current being 680 amperes at 3 volts. Pressure of motor brushes on commutator is 30 ounces.

OILING.—Put several drops of light engine oil in each of starter bearings every month.

GENERATOR.—Type L-61, M-768. Rotation is counter-clockwise, looking at commutator end. Generator current regulation is by third brush system. Maximum charging rate is 15 amperes, reached at 15 to 20 miles per hour. Charging rate reduces to 12 amperes at 30-40 miles per hour. Shunt field current is 6-8 amperes at 7.8 volts. Pressure of brushes on commutator is 14 ounces. Charging rate is varied by inserting a special toothed wrench in the adjusting hole in the commutator end plate and moving the third brush assembly. Turn the wrench in a clockwise direction to increase the charging rate, and in a counter-clockwise direction to decrease the charging rate. The 1917-18 cars used an M-768 generator in which the maximum charging rate of 12-16 amperes was reached at 1200-1600 R.P.M. of armature or 20-25 miles per hour. Third brush was adjusted by loosening two studs holding the third brush arm and tapping the arm.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted in generator frame. Relay closes at 8-9 miles per hour or 550-600 R.P.M. of the armature, and opens at 6-7 miles per hour or 500-550 R.P.M. of the armature. Relay contacts separate .045 inch. Air gap between the relay armature and coil core is .035 inch, contacts closed. To adjust relay, connect a voltmeter across the main brushes of the generator, and slowly speed up the engine. Insert the special socket wrench in the small adjusting hole in the commutator end plate and vary the spring tension on the relay armature until the contacts close when the voltmeter indicates 6.5 volts. Closing of relay will be indicated by the ammeter showing "Charge". Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 18 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash lamp is 6-8 volt, 2 cp. Tail lamp is 6-8 volt, 2 cp.

Detroit

MODEL 6-45 (1916)

AUTO-LITE STARTING AND LIGHTING SYSTEM CONNECTICUT IGNITION

BATTERY.—Battery is 6 volt, 80 ampere-hour. The negative (—) terminal is grounded at starting motor.

IGNITION.—Breaker contacts separate .020 inch. They are made of tungsten. When the condition of the points affects the ignition, renew the inner breaker mechanism. For temporary service, resurface contacts with fine emery cloth.

TIMING.—Breaker contacts begin to separate when top dead center mark on flywheel is $1\frac{1}{2}$ inches past indicator, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .027 inch to .030 inch.

OILING.—Refill the cup under the breaker head with pure vaseline and turn down every month. If car is driven more than 1000 miles in a month, this must be done every 1000 miles. Do not put grease or oil in the cup.

STARTER.—Starter Model M E is used. Starter is connected to engine through a Bendix drive.

OILING.—Thoroughly clean out and repack starter bearings with soft cup or ball bearing grease every six months.

GENERATOR.—Generator current regulation is by reverse series field. Maximum charging rate of 17-18 amperes is reached at 25-30 miles per hour, or 3200-3700 R.P.M., of armature.

Amperes	Generator Data. Model G	R.P.M.
5.00		750- 860
10.00		1225-1400
12.50		1600-1825
15.00		2125-2450
17-18		3200-3700

A variation of 1.5 amperes from these amounts is allowable. Output may be varied slightly by adjusting brush pressure on commutator. Brush pressure should be 1 to $1\frac{1}{4}$ pounds. Operating freely as a motor, generator takes 2.8 amperes, armature revolving at 350 R.P.M. Shunt field takes 1.1 amperes.

OILING.—Put several drops of light engine oil in each of generator oilers every two weeks. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.

RELAY.—Relay closes at 7-9 and opens at 5-7 miles per hour. Relay closes at 500-575 R.P.M., of armature. Charging current is .5 to 1.5 amperes at closing, and the discharge current 0 to 1 ampere at opening of relay. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 17 cp. Dash lamp is 6-8 volt, 2 cp. Tail lamp is 6-8 volt, 2 cp.

Plate No. 142

COMMONWEALTH (1919)

DYNETO GENERATING, STARTING AND LIGHTING SYSTEM ATWATER KENT IGNITION

BATTERY.—Battery is 6 volt, 80 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Type CC. Breaker contacts separate .006 inch. They are made of tungsten. When the condition of the points affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING.—Every two weeks remove the distributor cap and rotor and put 4 or 5 drops of light engine oil in the oil hole exposed. Put a small amount of vaseline on the cam, applying with a toothpick. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

TIMING.—Breaker contacts begin to separate when piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 3, 4, 2.

SPARK PLUG GAPS.—Spark plug gaps are .025 inch.

STARTER.—Model DA. Starter is connected to the engine through a Bendix drive.

Starter Data

Torque	R.P.M.	Amperes
0 lb. ft.	5600	25
5 lb. ft.	850	250
10 lb. ft.	250	420
14 lb. ft.	Lock	530

OILING.—Put 4 or 5 drops of light engine oil in rear starter bearing oiler every month. Every three months remove the cap at front end and saturate the felt packing with light engine oil.

GENERATOR.—Model CA. Generator current regulation is by third brush system. Maximum current output is 12-15 amperes, reached at 1200 R.P.M. of the armature or 24 miles per hour.

Generator Data

Cold Test Amperes	R.P.M.	Hot Test Ampere
6	600	5
13	900	10
15	1200	12
13.5	1600	11.5
11.5	2000	10

OILING.—Put 4 or 5 drops of light engine oil in each of generator bearing oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 8-10 miles per hour, or 450-500 R.P.M. of armature, and opens at 6-8 miles per hour or 400-450 R.P.M. of armature. Relay contacts separate 3/32 inch. Air gap between relay armature (moving member) and coil core is 1/8 inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 20 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp.

FUSES.—Fuse is 10 ampere.

Plate No. 143

KLINE-KAR

MODEL 6-42-H (1919). SERIAL NOS. 6000 TO 7000

WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM CONNECTICUT IGNITION

BATTERY—Battery is 6 volt, 80 ampere-hour. The positive (+) terminal is grounded.

IGNITION—Model 17 Igniter. Type M Coil. Type 96-Y Switch. Breaker contacts separate .020 to .025 inch. When the condition of the contacts affects the ignition, renew the inner breaker mechanism. For temporary service, resurface contacts with fine emery cloth.

OILING—Refill the cup under the breaker head with pure vaseline and turn down every month. If the car is driven more than 1000 miles in a month, this must be done every 1000 miles. Do not put grease or oil in the cup.

TIMING—Breaker contacts begin to separate when piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS—Spark plug gaps are .025 inch.

STARTER—Frame 710. Starter is connected to the engine through a Bendix drive.

Starter Data

Torque	R.P.M.	Amperes
0 lb. ft.	4000	40
2 lb. ft.	1400	120
4 lb. ft.	1000	180
8 lb. ft.	700	280
14 lb. ft.	Lock	450

OILING—Put 5 or 6 drops of light engine oil in each of the starter oilers every month.

GENERATOR—Frame 400-R. Generator voltage regulation is by vibrating regulator. Maximum generator output is 15 amperes at 6.8 volts, reached at 1400 R.P.M. of the armature or 25 miles per hour.

OILING—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY-REGULATOR—Relay and regulator are combined into one unit. Relay closes at 550-600 R.P.M. of armature or 8-10 miles per hour, and opens at 500-550 R.P.M. of armature or 6-8 miles per hour. Charging current is .5 to 1 ampere at closing and the discharge current 1-3 amperes at opening of relay contacts. Relay is adjusted by bending the two brass prongs at the end of the moving member. To adjust regulator, connect a voltmeter between the "A" generator terminal and ground. Operate the generator at 1400 R.P.M., charging a battery of 1.250 solution. Then adjust the regulator spring tension by means of the thumb screw, until the voltmeter indicates 7 volts. Air gap between regulator armature (moving member) and coil core is .045 to .055 inch. Air gap between relay armature and coil core is .055 to .060 inch. Clean relay and regulator contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS—Head lamps are 6-8 volt, 15 cp. Dash and tail lamps are 6-8 volt, 2 cp.

FUSES—Fuses are 15 ampere.

Chandler

Light Six (1917-18) (Serial Nos. 35,001 and up)
Gray and Davis Generating, Starting and Lighting
System

Bosch Magneto Ignition

Battery.—Battery is 6 volt, 80 ampere-hour. The positive (+) terminal is grounded.

Ignition.—Breaker contacts separate .014 inch to .016 inch. When the condition of the points affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sand paper.

Oiling.—Put 2 or 3 drops of light machine oil in magneto oilers every month. If car is driven more than 1000 miles in a month, the oiling must be done every 1000 miles.

Timing.—Breaker contacts separate when piston entering power stroke is on top dead center spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—Spark plug gaps are .026 inch.

Starter.—Starting motor is No. 126. It is connected to the engine through a Bendix drive.

Operating freely, starter takes 35 amperes at 3 volts, and runs at 2200 R. P. M. With the same current starter runs at 4500 R. P. M., with 5.5 volts, and at 5000 R. P. M., with 6 volts. The torque is 1.5 pound-feet at 1660 R. P. M., taking 100 amperes at 5.75 volts. Pressure of motor brushes on commutator is 2¼ pounds.

Oiling.—Put 4 or 5 drops of light engine oil in each of the starter bearing oilers every month.

Generator.—Generator current regulation is by third brush system.

GENERATOR DATA, TYPE No. 400

Amperes	R. P. M.	Miles per Hour
0.0	400	6
6.0	600	9
12.0	800	12
13.5	1000	15
14.4	1200	18
14.8	1400	21
14.4	1600	24
14.0	1800	27
12.0	2400	36
10.0	3000	45
8.0	3600	54

Generator is driven at 1½ times engine speed. Rotation is counter-clockwise, looking at commutator end. Position of third brush is adjustable by means of a rack and pinion movement operated by turning a screw, accessible through an opening in the end plate. Turn the screw to the right to increase the charging rate and to the left to decrease the charging rate.

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Relay.—Relay closes at 7 miles per hour and opens at 5 miles per hour. Charging current is 1 to 3 amperes at closing, and discharge current 0 to 2 amperes at opening of relay contacts. Contacts separate .015 inch. Minimum air gap between armature (moving member) and coil core is .020 inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sand paper. Remove all grit. Adjust before again putting into service.

Lamps.—Head lamps are 6-8 volt, 18 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash lamp is 6-8 volt, 4 cp. Tail lamp is 6-8 volt, 2 cp.

Fuses.—Fuses are 20 ampere.

Plate No. 144

Buick

MODELS D34 AND D35 (1917) DELCO GENERATING STARTING AND LIGHTING SYSTEM DELCO IGNITION

Plate No. 145

BATTERY—Battery is 6 volt, 90 ampere-hour. The negative (—) terminal is grounded.

IGNITION—Breaker contacts should separate .018 in. They are made of tungsten. Should they become badly burned or pitted, affecting the ignition, remove and resurface them by drawing across a piece of fine emery cloth laid on a flat surface, as on the bed of a drill press, finishing on a very hard oil stone. Clean all oil from contacts before again putting into service.

TIMING—Breaker cam should be set so that when the flywheel marking "SC" is in line with the indicator the contacts will just open when the slack in the distributor gears is rocked forward and will close when the unit is rocked backward, spark control lever and assembly in the fully retarded position.

FIRING ORDER—The firing order is 1, 3, 4, 2.

SPARK PLUG GAPS—The spark plug gaps should be .028 inch to .030 inch.

OILING—The distributor bearings are of the oilless type, and need no lubrication. If the rotor button and its track are not well polished, apply a very small amount of vaseline.

STARTER-GENERATOR—Motor and generator are combined into one unit, but are electrically separate. The motor is connected to the engine through a non-automatic mechanical shift. The raising and lowering of a motor brush serves as a starting switch. When the ignition switch is closed, the generator runs as a motor in order to facilitate the meshing of the gears. When the starter pedal is depressed the gears are drawn into mesh, the generator circuit is broken by the raising of the generator brush, and the motor brush is allowed to come into contact with the commutator, thus applying the full battery pressure to the motor and cranking the engine.

GENERATOR—Generator current regulation is by third brush method.

Generator Data. Model No. 94.			
Cold-Amperes	R.P.M.	Warm-Amperes	R.P.M.
Neutral	560 or less	Neutral	600
8 - 9.5	900	7.5 - 8.5	900
12.5-16	1500	11.5-15	1500

To adjust the charging rate loosen the two screws on the bottom of generator frame, and move the slotted plate which carries the third brush holder to the left (looking at commutator end) to increase charging rate, and to the right to decrease it. Generator should begin to supply current at 8 miles per hour and reach its normal maximum output of 15 amperes at 20-25 miles per hour.

OILING—The distributor gear housing is packed with soft cup grease, which should be renewed every six months. Put 4 or 5 drops of light engine oil in the oiler at the rear end of the armature shaft every week.

RELAY—There is no relay. The circuit between the generator and battery is controlled by the ignition switch.

CIRCUIT BREAKER—There is a vibrating circuit breaker on the combination switch to take the place of fuses in the lighting circuits. It requires a current of 25 amperes to start this device vibrating, but when vibrating a current of 3 to 5 amperes will cause it to continue.

LAMPS—Head lamps are 6-8 volt, 17 cp. Dimmer lamps are 6-8 volt, 5 cp. Dash and tail lamps are 6-8 volt, 2 cp.

MODEL NUMBERS—The motor-generator is No. 94. Motor clutch is No. 12,647. Ignition coil is No. 2138. Combination switch is No. 1075.

Buick

MODELS E-4-34 AND E-4-35 (1918)

DELCO GENERATING, STARTING AND LIGHTING SYSTEM

DELCO IGNITION

BATTERY.—Battery is 6 volt, 84 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 2157. Breaker contacts separate .018 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING.—A wick oiler is provided for lubricating the distributor shaft bearings. Fill the oil cup with light engine oil every two weeks. If the track of the rotor button in the distributor head is not well polished apply a small amount of vaseline with a soft cloth. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when the seven degree mark on the flywheel (one inch from the top dead center mark) is at the indicator, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 3, 4, 2.

SPARK PLUG GAPS.—Spark plug gaps are .028 to .030 inch.

STARTER-GENERATOR.—Model No. 121. Starter and generator are combined into one unit but are electrically separate. Starter is connected to the engine through a set of reduction gears meshed by the operator.

GENERATOR.—Generator current regulation is by third brush system. Generator begins to supply current at 560-600 R.P.M. of the armature or 7-9 miles per hour, and reaches its maximum current output of 12-16 amperes at 1500 R.P.M. of the armature or 20-25 miles per hour.

Cold Test		Generator Data		Hot Test	
Amperes	R.P.M.	Amperes	R.P.M.	Amperes	R.P.M.
Neutral	560	Neutral	600		
8.0-9.5	825	7.5-8.5	950		
12.5-16.0	1500	12.0-15.0	1500		
11.0-14.5	1800	11.5-14.5	1800		

To vary the charging rate loosen the two screws on the bottom of the generator frame and move the slotted plate, which carries the third brush holder, to the left (looking at commutator end) to increase the charging rate, and to the right to decrease it.

OILING.—Put 4 or 5 drops of light engine oil in each of the starter-generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles. The distributor gear housing is packed with soft cup grease which should be renewed every six months. In cold weather, add a few drops of light oil to keep the grease soft.

RELAY.—There is no relay. The circuit between the generator and the battery is controlled by the ignition switch.

LAMPS.—Head lamps are 6-8 volt, 17 cp. Dimmer lamps are 6-8 volt, 5 cp. Dash and tail lamps are each 6-8 volt, 2 cp.

CIRCUIT BREAKER.—A vibrating circuit breaker takes the place of fuses. It requires a current of 25 amperes to start this device vibrating. While vibrating, the current flow is 3-5 amperes.

Buick

MODELS D-6-44, D-6-45, D-6-46, D-6-47 (1916-17)

(SERIAL NOS. 144,717 TO 343,782)

DELCO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

BATTERY.—Battery is 6 volt, 84 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Breaker contacts separate .018 inch. They are made of tungsten. When the condition of the points affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING.—Put 4 or 5 drops of light engine oil in the distributor shaft oiler every two weeks. If the track of the rotor button inside distributor head is not well polished, apply a small amount of vaseline with a soft cloth. If car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker cam is set so that when engine is turned to the seven degree mark on flywheel (approximately one inch from dead center), contacts should just separate when breaker unit is rocked forward as far as the slack in the distributor gears will allow, and again close when the unit is rocked backward.

FIRING ORDER.—The firing order is 1, 4, 2, 6, 3, 5.

SPARK PLUG GAPS.—Spark plug gaps are .028 to .030 inch.

STARTER-GENERATOR.—Starter and generator are combined into one unit, but are electrically separate. Starter is connected to the engine through a set of reduction gears meshed by the operator. Two overrunning clutches are provided. In connection with the ignition switch, a circuit is closed allowing the current to flow through the generator windings, causing the armature to revolve slowly, aiding the meshing of the reduction gears. One clutch permits this rotation, and also permits a relatively high speed of the armature, necessary when operating as a starter. The second overrunning clutch prevents the engine from driving the armature through the reduction gears. Depressing the starting pedal meshes the reduction gears, opens the generator circuit, and allows the motor brushes to come in contact with the commutator, closing the starter circuit and cranking the engine. When the pedal is released, a spring reverses these operations.

GENERATOR.—Generator current regulation is by third brush system.

Generator Data.		Motor-Generator No. 70	
Cold—Amperes	R.P.M.	Warm—Amperes	R.P.M.
Neutral	560	Neutral	600
8.0- 9.5	825	7.5- 8.5	825
12.5-16.0	1500	12.0-15.0	1500
11.0-14.5	1800	11.5-14.5	1800

To adjust the charging rate, loosen the two screws on the bottom of generator frame and move the slotted plate which carries the third brush holder to the left (looking at commutator end), to increase charging rate, and to the right to decrease it. Generator begins to supply current at 7-8 miles per hour, and reaches its maximum output of 15-16 amperes at 20-25 miles per hour.

OILING.—Put 6 or 8 drops of light engine oil in the oiler on the rear end of armature shaft and turn down the grease cup two turns every two weeks. If car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles. The distributor gear housing is packed with soft cup grease which should be renewed every six months.

RELAY.—There is no relay. The circuit between the generator and the battery is controlled by the ignition switch. The overrunning clutch at the driving end allows generator to operate as a motor when battery's pressure is above that of generator. If engine is killed when stopping, the noise made by the clutch serves to attract the operator's attention to open the ignition switch. The opening and closing of the generator-battery circuit by the operator takes the place of the relay.

LAMPS.—Head lamps are 6-8 volt, 17 cp. Dimmer lamps are 6-8 volt, 5 cp. Dash and tail lamps are 6-8 volt, 2 cp.

CIRCUIT-BREAKER.—A vibrating circuit-breaker takes the place of fuses. It requires a current of 25 amperes to start this device vibrating. While vibrating, the current flow is 3 to 5 amperes.

MODEL NUMBERS.—Motor-Generator is No. 70. Motor Clutch is No. 12224. Ignition Coil is No. 2138. Combination Switch is No. 1066.

MODEL 34 (1916-17)

BOSCH-RUSHMORE GENERATING, STARTING AND LIGHTING SYSTEM BOSCH IGNITION

BATTERY.—Battery is 12 volt, 50 ampere-hour. The positive (+) terminal is grounded at the starting motor.

IGNITION.—Breaker contacts separate .014 to .016 inch. When the condition of the points affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Put 2 or 3 drops of light machine oil in each of magneto oilers every month. If the car is driven more than 1000 miles in a month, the oiling must be done every 1000 miles.

TIMING.—Breaker contacts separate when the top dead center mark on flywheel is one inch past the indicator, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .028 to .032 inch.

STARTER.—Starter is connected to the engine through a pinion and ring gear on the fly-wheel, meshed by the magnetic attraction of the field poles for the armature.

GENERATOR.—Generator current regulation is by reverse series field and a regulating resistance. This regulating resistance is connected in shunt with the reverse series field. When cold, this unit has a very small resistance, but when hot, it has a greatly increased resistance. When cold, it forms practically a short circuit across the series field terminals, allowing but little current to flow through the series field. As the current through the resistance increases, its temperature and resistance increases, causing more current to flow through the reverse winding, reducing the output. As the resistance of the regulating coil increases in proportion to the current through it, the output is held practically constant at speeds above that necessary to produce the maximum output. The output is varied by changing the regulating resistance unit. The maximum charging rate of 10 amperes is reached at 25 miles per hour.

OILING.—Put 4 or 5 drops of light engine oil in each of generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 8-10 miles per hour and opens at 6-8 miles per hour. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 12-16 volt, 30 cp. Dimmer lamps are 12-16 volt, 6 cp. Tail lamp is 12-16 volt, 6 cp. Dash and tonneau lamps are each 12-16 volt, 6 cp.

FUSES.—Fuses are 20 ampere.

MARMON
Model 34 (1916-17)
Bosch Ignition
Plate No. 151

BIJUR GENERATING, STARTING AND LIGHTING SYSTEM
BOSCH MAGNETO IGNITION

BATTERY.—Battery is 6 volt, 120 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Magnetto breaker contacts separate .014 to .016 inch. When the condition of the points affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Put 3 or 4 drops of light machine oil in magnetto bearing oilers every month. Put a very small amount of vaseline on the fiber bumper of contact arm, applying with a toothpick. If car is driven more than 1000 miles in a month, these attentions must be given every 1000 miles.

TIMING.—Contacts begin to separate when the top dead center mark on the flywheel is 1 inch before the indicator, spark control lever and breaker assembly fully retarded.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .028 to .032 inch.

STARTER.—Type AD 200 M 923. Anticlockwise rotation, commutator end. Starter is connected to engine through a special Bijur type, Bendix drive.

OILING.—Put several drops of light engine oil in each of starter bearing oilers every month.

GENERATOR.—Type K-643, M-363, M-792 or M-888. Anti-clockwise rotation, commutator end. Generator voltage regulation is by vibrator regulator. Maximum charging rate is 25 amperes, decreasing to about 5 amperes as battery becomes fully charged. Maximum voltage and charging current is reached at 15 miles per hour, or 1000-1400 R.P.M. of armature. Lights may be operated from generator, battery disconnected. It does not matter which generator terminal is connected to the battery, as the generator will automatically assume the right polarity to charge the battery.

OILING.—Put 4 or 5 drops of light engine oil in each of generator oilers every two weeks. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.

RELAY-REGULATOR.—Relay closes at 10 and opens at 7 miles per hour. Charging current is 1 to 3 amperes at closing, and the discharge current 0 to 1 ampere at opening of relay. Relay and regulator may be adjusted through two holes provided for this purpose in the cover. On the old type regulators, this hole is provided with a brass plug. The newer type regulators have brass plugs covered with a lead seal. Latest type regulators have brass plugs covered with a lead seal. Latest types have holes covered with lead seal, plug being omitted. Seal is to prevent incompetent parties tampering with the adjustment. In order to make adjustments, it is necessary to remove the lead seals and take out the brass plugs with a special spanner wrench. Then adjust regulator by a small socket wrench inserted in the left hole. The right hole is for adjusting relay. Turning the nut to the right (facing hole) increases the cut-in voltage. Turning it to the left decreases cut-in voltage. Generator voltage is about 6.5 volts when relay closes. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 30 cp. Dimmer lamps are 6-8 volt, 8 cp. Dash lamp is 6-8 volt, 4 cp. Tonneau lamp is 6-8 volt, 4 cp. Trouble lamp is 6-8 volt, 4 cp. Tail lamp is 6-8 volt, 4 cp.

MODELS S.D.-4 AND E.C.-6 (1915)

WAGNER GENERATING, STARTING AND LIGHTING SYSTEM

REMY IGNITION

BATTERY.—Willard, Type S-J-W-4. 6 volts, 100 ampere-hour. The two-wire system is used.

IGNITION.—Breaker contacts separate .015 inch. When the condition of the points affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Put 4 or 5 drops of light engine oil in the oiler behind the distributor housing, every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

TIMING.—Breaker contacts begin to separate when the flywheel marking "U.D.C. No. 1" is $\frac{5}{8}$ inch past the indicator, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order of the 4 cylinder cars is 1, 3, 4, 2. The firing order of the 6 cylinder cars is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .025 inch.

STARTER.—Model E.M.-113, Type 53-T-3. Starter is connected to the engine through a chain drive and an overrunning clutch.

OILING.—Put 5 or 6 drops of light engine oil in each of starter bearing oilers every month. At the same time remove the plug from the reduction gear case and inject Gredag grease.

GENERATOR.—E.M.-114, Type 51-X. Generator current regulation is by third brush system. Rotation is counter-clockwise, viewed from commutator end. Maximum current output of 18 amperes is reached at 18-20 miles per hour.

Amperes	Generator Data	R.P.M.
10		700
16		900
18		1100
14		1500
9		2000

LAMPS.—Head lamps are 6-8 volt, 17 cp. Dash and tail lamps are each 6-8 volt, 2 cp.

FUSES.—Fuses are 15 ampere.

SERIES 16, 17 AND 18 (1916-17-18)
WAGNER GENERATING, STARTING AND LIGHTING SYSTEM
REMY IGNITION

BATTERY.—Willard Type S-T-W-4, 6 volts, 100 ampere hour. The positive (+) terminal is grounded.

IGNITION.—Breaker contacts separate .015 inch. When the condition of the points affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Refill the cup under the distributor head with soft cup grease and turn down two turns every two weeks. Put a small amount of vaseline on the fiber bumper of the contact arm, using a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when the flywheel marking "UP-D-C-1" is 4 inches before the indicator on the 4 cylinder cars, and 5 1/8 inches before the indicator on the 6 cylinder cars, spark control lever and breaker assembly fully advanced.

FIRING ORDER.—The firing order of the 4 cylinder cars is 1, 3, 4, 2. The firing order of the 6 cylinder cars is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .025 inch.

STARTER.—Model E.M.-154, Type 36-T. Starter is connected to the engine through a set of reduction gears, a chain drive and an overrunning clutch.

OILING.—Put 5 or 6 drops of light engine oil in the starter oilers every month. At the same time remove the plug from the reduction gear case and inject Gredag grease.

GENERATOR.—Model E.M.-126, Type 45-W. Generator current regulation is by third brush system. Rotation is counter-clockwise, viewed from commutator end. Maximum current output of 19 amperes is reached at 20 miles per hour.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator bearing oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 8-10 miles per hour and opens at 6-8 miles per hour. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 12 cp. Dash and tail lamps are each 6-8 volt, 2 cp. Tonneau lamp is 6-8 volt, 5 cp.

FUSES.—Fuses are 15 ampere.

APPERSON

ANNIVERSARY MODEL (1918-19)

BIJUR GENERATING, STARTING AND LIGHTING SYSTEM

REMY IGNITION

BATTERY.—Willard, Type SJWN-3, 6 volt, 102.8 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Breaker contacts separate .022 inch. When the condition of the points affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper. Ignition current is 4½-5 amperes, engine idle, breaker contacts and ignition switch closed.

OILING.—Refill the cup under the distributor head with soft cup grease and turn down two turns every two weeks. Put a small amount of vaseline on the fiber bumper of the contact arm, applying with a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when the top dead center mark on the fly-wheel is ½ inch past the indicator, spark control lever and breaker assembly in the fully retarded position.

SPARK PLUG GAPS.—Spark plug gaps are .025 inch.

FIRING ORDER.—The firing order is 1R, 4L, 3R, 2L, 4R, 1L, 2R, 3L.

STARTER.—Type E.D-160, M1114. Rotation is counter clockwise, looking at commutator end. Lock torque is 16.5 pound-feet, current 665 amperes, 3.6 volts. Pressure of brushes on commutator is 25 ounces.

OILING.—Put 5 or 6 drops of light engine oil in each of the starter oilers every month.

GENERATOR.—Type L-61, M-1193. Rotation is counter-clockwise, looking at commutator end. Generator current regulation is by third brush system. Maximum charging rate is 15 amperes, reached at 20 miles per hour, or 1400 R.P.M. of armature. Charging rate is varied by inserting a special toothed wrench in the adjusting hole in the commutator end plate and shifting the third brush assembly through a ratchet engagement. Turn the adjusting wrench to the right (facing commutator end) to increase the charging rate, and to the left to decrease the charging rate. Maximum current output must not exceed 15 amperes at 1400-1600 R.P.M. Pressure of brushes on commutator is 14 ounces.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted in generator frame. Relay closes at 8-9 miles per hour or 550-600 R.P.M. of armature, and opens at 6-7 miles per hour or 500-550 R.P.M. of armature. Relay contacts separate .045 inch. Air gap between armature (moving member) and coil core is .035 inch, contacts closed. To adjust relay, connect a voltmeter across the main brushes of the generator. Then insert a special socket wrench in the small adjusting hole in commutator end plate and adjust relay spring tension until the contacts close when the voltage reaches 6.5 volts. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 18 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash, tail and tonneau lamps are 6-8 volt, 2 cp.

FUSES.—Fuses are 10 ampere.

EMPIRE
MODELS 40, 45, AND 60 (1916-17)
MODELS 50, 51, 70, 70A (1916-18-19)
AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM
CONNECTICUT IGNITION

BATTERY.—Battery is 6 volt, 85 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Breaker contacts separate .020 inch. They are made of tungsten. When the condition of the points affects the ignition, renew the inner breaker mechanism. For temporary service, resurface contacts with fine emery cloth.

OILING.—Refill the cup under the breaker head with pure vaseline and turn down every month. If car is driven more than 1000 miles in a month, this must be done every 1000 miles. Do not put grease or oil in the cup.

TIMING.—Breaker contacts separate when piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order of Models 50 and 51 is 1, 3, 4, 2. The firing order of Models 70 and 70A is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .027 inch.

STARTER.—Model ME or MC. Starter is connected to the engine through a Bendix drive.

OILING.—Clean and repack starter bearings with soft cup grease every six months. Put in 1 or 2 drops of oil every month to keep grease soft.

GENERATOR.—Models GF and GG. Generator current regulation is by reverse series field.

Generator Data

Model GF		Model GG	
Used on 4 Cylinder Cars		Used on 6 Cylinder Cars	
Amperes	R.P.M.	Amperes	R.P.M.
5.00_____	430- 490	5.00_____	750- 860
10.00_____	730- 870	10.00_____	1225-1400
12.50_____	945-1180	12.50_____	1600-1825
15.00_____	1225-1660	15.00_____	2125-2450
16-19_____	2200-2800	17-19_____	3200-3700

The brush pressure is 1 to 1¼ pounds. When Model GF is operating freely as a motor, the current is 1.8 amperes, speed 200 R.P.M. When Model GG is operating freely as a motor, the current is 2.8 amperes, speed 350 R.P.M. The shunt field current of Model GF is 1 ampere. The shunt field current of Model GG is 1.1 amperes.

OILING.—Put 5 or 6 drops of light engine oil in each of generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 6 to 8 miles per hour and opens at 4 to 6 miles per hour. Model GF Generator closes relay at 230-265 R.P.M. Model GG Generator closes relay at 500-575 R.P.M. Charging current at closing is .5 to 1.5 amperes, and the discharge current 0 to 1 ampere at opening of relay contacts.

LAMPS.—Head lamps are 6-8 volt, 17 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are in series and are each 3-4 volt, 2 cp. Tonneau lamp is 6-8 volt, 2 cp.

FUSES.—Fuses are 20 ampere.

Plate No. 158

BATTERY.—Battery is 12 volt, 50 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Breaker contacts separate .018 to .020 inch. When the condition of the points affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Refill the cup under the distributor head with soft cup grease and turn down two turns every two weeks. Put a small amount of vaseline on the fiber bumper of the contact arm using a toothpick. If the car is driven more than 500 miles in two weeks, these attentions should be given every 500 miles.

TIMING.—Breaker contacts begin to separate when piston entering stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 2, 4, 3.

SPARK PLUG GAPS.—Spark plug gaps are .028 to .030 inch.

STARTER-GENERATOR.—Starter and generator are combined into one unit, but are electrically separate. Starter is connected to the engine through a set of reduction gears.

Starter Data. Motor-Generator No. 129-A

Torque	R.P.M.	Amperes	Volts
0 lb. ft.	1100-1200	6-10	12.0-13.0
2 lb. ft.	900-1000	20-30	11.4-11.3
3 lb. ft.	800-900	30-40	11.3-11.5
5 lb. ft.	600-700	40-50	10.5-10.6
7 lb. ft.	500-600	70-80	10.0-10.5
8 lb. ft.	Lock	300-350	10.0

GENERATOR.—Generator current regulation is by reverse series field and vibrator regulator. Maximum output is reached at 15 miles per hour.

Generator Data. Motor-Generator No. 129-A

Amperes	R. P. M.	Volts
0.0	1050-1140	13.0-13.5
5.0	1200-1350	14.0-14.5
7.5	1250-1450	14.5-15.0
6.5	6000	14.0-15.0

OILING.—Put 5 or 6 drops of light engine oil in each of starter-generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY-REGULATOR.—Relay closes at 8-10 miles per hour and opens at 6-8 miles per hour. Air gap between relay armature (moving member) and coil core is .012 to .015 inch. Contacts separate .012 to .015 inch. Clean relay and regulator contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service. Increasing spring tension on regulator armature will increase the output, and decreasing spring tension will decrease the output.

LAMPS.—Head lamps are 12-16 volt, 16 cp. Dimmer lamps are 12-16 volt, 6 cp. Dash and tail lamps are connected in series and are each 6-8 volt, 3 cp.

FUSES.—There is a 15 ampere fuse on relay-regulator base. Other fuses are 4 ampere.

MODEL NUMBERS.—Motor-Generator is No. 129-A. Relay-Regulator is No. 262-A. Ignition Coil is No. 49-A. Combination Switch is No. 145-A.

JEFFERY

MODEL 671 (1917)

BIJUR GENERATING, STARTING AND LIGHTING SYSTEM SPLITDORF IGNITION

BATTERY.—Battery is 6 volt, 85 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Dixie Magneto. Breaker contacts separate .020 inch. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Fill magneto oil cups with light engine oil every month. If the car is driven more than 1000 miles in a month, the oiling must be done every 1000 miles.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .020 to .025 inch.

STARTER.—Type F-65, M-664. Rotation is clockwise, looking at the commutator end. Starter is connected to the engine through a Bijur automatic pinion shift.

OILING.—Put 5 or 6 drops of light engine oil in each of the starter oilers every month.

GENERATOR.—Type L-61, M-399, 467, 677, 767. Rotation is counter-clockwise, looking at commutator end. Generator current regulation is by third brush system. Maximum current output of generator is 12-15 amperes at 1400-1600 R.P.M. of the armature or 25 miles per hour. Output is varied by shifting third brush. The third brush is secured to the generator by two stud bolts, the nuts of which appear in a recess in the front head of the generator. Loosen these nuts with a socket wrench and shift the brush by gently tapping the shank of the wrench. Moving the brush in a counter-clockwise direction will increase the output. Moving the brush in a clockwise direction will decrease the output. A movement of 1/16 inch will vary the current output 2-3 amperes. Tighten the nuts after adjusting the brush position. Brush adjustment is made to give the desired rate with the generator hot, charging a battery of 1250 solution, or higher. There is a 10 ampere fuse mounted on generator to protect the field windings should excessively high resistance occur in the charging circuit.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted in the generator frame. Relay closes at 8-10 miles per hour or 500-600 R.P.M. of the armature and opens at 6-8 miles per hour or 450-500 R.P.M. of the armature. The charging current is 1-3 amperes at closing, and the discharge current is 0-2 amperes at the opening of the relay contacts. Clean contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 20 cp. Dimmer lamps are 6-8 volt, 5 cp. Dash lamp is 6-8 volt, 2 cp. Tail lamp is 6-8 volt, 2 cp. Trouble lamp is 6-8 volt, 2 cp. Dome lamp is 6-8 volt, 5 cp.

FUSES.—Fuses are 20 ampere.

NOTE.—Plate 235 applies to cars having Serial Nos. 1 to 87686. On cars numbered above 87687 the lead "A" is connected to post marked "Dyn" instead of post marked "Bat" and the ammeter indicates charge and discharge instead of indicating the generator's output only.

MODELS 6-40 (1915), 4-38 AND 6-38 (1916) REMY GENERATING, STARTING AND LIGHTING SYSTEM REMY IGNITION

BATTERY.—Battery is 6 volt, 80 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Breaker contacts separate .020 to .025 inch. If burned or pitted, affecting the ignition, resurface with a fine flat jeweler's file or worn No. 00 sandpaper.

TIMING.—Contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position on Models 6-38 and 6-40 and with lever about 1½ inches from the fully retarded position on Model 4-38 cars. (First see that breaker assembly is in the fully retarded position when lever is fully retarded.)

FIRING ORDER.—The firing order of Model 4-38 is 1, 3, 4, 2. The firing order of Models 6-38 and 6-40 is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .025 to .030 inch.

OILING.—Refill the cup under the distributor head with soft cup grease and turn down two turns every two weeks. Put a small amount of vaseline on the fiber bumper of the contact arm, using a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

STARTER.—Model 118-A. Starter is connected to the engine through a Bendix drive. When operating freely, it should take 32-40 amperes at 6 volts, armature revolving at 3750-4200 R.P.M.

Starter Data

Torque	R.P.M.	Amperes	Volts
0.0 lb. ft.	3750-4200	32- 40	6.0
1.5 lb. ft.	1500-1540	88- 98	5.7-5.8
2.2 lb. ft.	1200-1400	110-120	5.5-5.7
3.0 lb. ft.	1020-1150	130-145	5.4-5.5
4.0 lb. ft.	800-1000	158-175	5.3-5.4

OILING.—Put 4 or 5 drops of light engine oil in each of the starter oilers every month.

GENERATOR.—Model No. 168-A. Generator current regulation is by a vibrating regulator.

Generator Data

Amperes	R.P.M.	Volts
0.0	600- 650	6.0
7.0	780- 850	6.4
14.5	2500-3000	7.2

When operated freely as a motor, generator takes 5.5 amperes at 5.7 volts, armature revolving at 420 R.P.M.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY-REGULATOR.—Relay closes at 600-650 R.P.M. of the armature or 8-10 miles per hour and opens at 550-600 R.P.M. of the armature or 6-8 miles per hour. The air gap between relay armature (moving member) and coil core is .012 to .015 inch, contacts closed. Contacts separate .012 to .015 inch. Clean relay and regulator contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service. Increasing spring tension on regulator armature will increase the output. Decreasing the spring tension will decrease the output.

LAMPS.—Head lamps are 6-8 volts, 15 cp. Dimmer lamps are 6-8 volts, 4 cp. Dash lamp is 6-8 volts, 2 cp. Tail lamp is 6-8 volts, 2 cp.

FUSES.—Generator fuse is 15 ampere. Lighting fuses are 4 ampere.

AUBURN

MODEL 6-39 (1917-18)

REMY GENERATING, STARTING AND LIGHTING SYSTEM

REMY IGNITION

BATTERY.—Battery is 6 volt, 80 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Breaker contacts separate .020 to .025 inch. If burned or pitted, affecting the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

TIMING.—Contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 4, 2, 6, 3, 5.

SPARK PLUG GAPS.—Spark plug gaps are .025 to .030 inch.

OILING.—Refill the cup under the distributor head with soft cup grease and turn down two turns every two weeks. Put a small amount of vaseline on the fiber bumper of the contact arm, using a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

STARTER.—Model No. 292A. Starter is connected to the engine through a Bendix drive.

Starter Data

Torque	R.P.M.	Amperes	Volts
0 lb. ft.	3300	60	6.0
1 lb. ft.	2400	110	5.7
4 lb. ft.	1000	270	4.65
7 lb. ft.	225	395	3.7
9 lb. ft.	50	435	3.6
10-11 lb. ft.	Lock Torque	450	3.6

OILING.—Put several drops of light engine oil in each of the starter oilers every month.

GENERATOR.—Generator current regulation is by a vibrating regulator.

Model 240-A			Generator Data			Model 245-A		
Amperes	R.P.M.	Volts	Amperes	R.P.M.	Volts	Amperes	R.P.M.	Volts
0.0	360	6.0-6.4	0.0	600-650	6.0			
7.0	500	6.3-6.7	7.0	700-750	6.5			
11.0	800	6.5-6.9	13-14	1500	6.9			
12.1	1000	6.5-6.7	13-14	3000	6.9			
12.5	1500	6.5-6.7						

When operating freely as a motor, Generator No. 240-A should take 3 to 4 amperes at 5.8 volts, armature revolving at 240 R.P.M. Generator No. 245-A should take 6 to 6.5 amperes at 5.8 volts, armature revolving at 470 R.P.M. Shunt field of Generator 240-A should take 2 amperes, and that of Generator 245-A, 3.5 to 4 amperes at 5.9 volts.

OILING.—Put 4 or 5 drops of light engine oil in each of the generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every two weeks.

RELAY-REGULATOR.—Relay closes at 8-10 and opens at 6-8 miles per hour. The air gap between relay armature and coil core is .012 to .015 inch, contacts closed. Contacts separate .012 to .015 inch. Increasing spring tension on regulator armature will increase the output. Decreasing the spring tension will decrease the output. Clean relay and regulator contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6.8 volt, 17 cp. Dimmer lamps are 6-8 volt, 5 cp. Dash and tail lamps are 6-8 volt, 2 cp.

FUSES.—Fuse on relay-regulator base is 15 ampere. Use commercial 15 ampere fuse wire in replacing it. Lighting circuit fuse is 25 ampere.

Plate No. 164

KING

MODEL E (1916) SERIAL NOS. 12,000 TO 14,950

WARD-LEONARD GENERATING, STARTING AND LIGHTING SYSTEM

ATWATER-KENT IGNITION

BATTERY.—Battery is 6 volt, 80 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Breaker contacts separate .010 to .012 inch. They are made of tungsten. When condition of contacts affects ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING.—Put a drop of light machine oil on each of the wearing parts of breaker and 4 or 5 drops in the hole beside notched shaft every two weeks. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.

TIMING.—Breaker contacts separate when piston entering power stroke is on top dead center, spark control in the fully retarded position.

FIRING ORDER.—The firing order is 1R, 4L, 3R, 2L, 4R, 1L, 2R, 3L.

SPARK PLUG GAPS.—Spark plug gaps are .027 to .031 inch.

STARTER.—Starter is connected to engine through a Bendix drive.

OILING.—Put 3 or 4 drops of light engine oil in oil hole on top of rear starter bearing every month. Every three months remove cup under bearing and repack with vaseline.

GENERATOR.—Generator current regulation is by a vibrating regulator. Relay is combined with regulator. Maximum generator output of 10 amperes is reached at 15 miles per hour.

OILING.—Put 2 or 3 drops of light engine oil in rear generator bearing oiler every month. If car is driven more than 1000 miles in a month, oiling must be done every 1000 miles. Thoroughly clean out bearing and repack with soft cup or ball bearing grease every six months.

RELAY-REGULATOR.—Relay closes at 9-10 and opens at 8-9 miles per hour. Charging current is 1-3 amperes at closing and the discharge current 0-1 ampere at opening of relay. Clean relay and regulator contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service. Increasing spring tension on regulator armature increases output. Decreasing spring tension decreases output.

LAMPS.—Head lamps are 6-8 volt, 15 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash lamp is 6-8 volt, 2 cp. Tail lamp is 6-8 volt, 2 cp.

Mitchell

Model B-48 Eight Cylinder (1916) Westinghouse Starting and Lighting System Connecticut Ignition

Plate No. 165

Battery.—Battery is 6 volt, 142 ampere-hour. The positive (+) terminal is grounded.

Ignition.—Breaker contacts should separate .023 inch. They are made of tungsten. They will operate properly even though quite rough. Should they become badly worn, affecting the ignition, the inner breaker mechanism should be renewed as directed on Page 50. In an emergency, contacts may be resurfaced enough to give service for 300 or 400 miles by drawing a piece of fine emery cloth between them.

Timing.—Breaker contacts should just begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly being in the fully retarded position.

Firing Order.—The firing order is 1R, 4L, 3R, 2L, 4R, 1L, 2R, 3L.

Spark Plug Gaps.—Spark plug gaps should be .027 inch.

Oiling.—Refill the cup under the breaker head with pure vaseline and turn down every month. If car is driven more than 1000 miles in a month, this must be done every 1000 miles. Do not put grease or oil in the cup.

Starter.—Starter is connected to the engine by a Bendix drive. It should deliver 2.5 pound-feet torque when running at 1200 R. P. M. It should deliver 12.5 pound-feet lock torque, taking about 400 amperes. Cold engine, heavy oil, tight bearings or other obstructions, or damp, grounded or short circuited windings will cause high current and low speed during the cranking operation. Discharged, dry or sulphated battery, defective battery connections, defective switch contacts, defective starter connections, dirty commutator, high mica, dirty or sticking brushes, defective connections between armature coils and commutator bars or open circuits are the chief causes of low speed and low current.

Oiling.—Put several drops of light engine oil in each of the starter oilers every month.

Generator.—Generator charging current regulation is by reverse series field. Current taken by the lamps does not pass through the series winding, hence has but little effect on the charging rate. Generator should deliver 14 amperes at 7.4 volts.

Relay.—Relay should close at about 8 miles per hour car speed. Charging current should be 1 to 1.5 amperes at closing and discharge current .75 to 1.25 amperes at opening of contacts. Air gap between relay armature (moving member) and coil core should be .027 inch to .030 inch. Contacts should separate .013 inch to .017 inch. Adjust by bending the brass prongs. Clean contacts by drawing a piece of unglazed paper between them. If badly burned or pitted, resurface with a piece of well worn No. 00 sand paper, drawing a piece of unglazed paper between them, to remove all grit, before again putting into service.

Oiling.—Put several drops of light engine or machine oil in each of the generator bearing oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling should be done every 500 miles.

Lamps.—Head lamps are 6-8 volt, 15 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash lamp is 6-8 volt, 2 cp. Tail lamp is 6-8 volt, 2 cp. Double contact base is used on all lamps.

Fuses.—Fuses are 20 amperes.

Model Numbers.—Starter is No. 700. Generator is No. 208. Storage battery is Willard, type SM7.

Plate No. 166

Mitchell-Lewis

REMY GENERATING, STARTING AND LIGHTING SYSTEM

1914-15 (SERIAL NOS. 40,000 TO 50,000)

REMY MAGNETO IGNITION

BATTERY.—Battery is 6 volt, 130 ampere-hour. The two-wire system is used.

IGNITION.—Breaker contacts separate .014 to .016 inch. When the condition of the points affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Put 3 or 4 drops of light engine oil in each of the magneto oilers every month. If car is driven more than 1000 miles in a month, the oiling must be done every 1000 miles.

TIMING.—Breaker contacts begin to separate when piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 3, 4, 2.

SPARK PLUG GAPS.—Spark plug gaps are .020 to .030 inch.

STARTER.—Starter is connected to the engine through a Bendix drive.

Starter Data. Model No. 6-A

R.P.M.	Amperes	Volts
4300-5500	50-60	5.6-6
2600	100	
1900	140	
1700	160	
1500	180	

The torque at 1000-1800 R.P.M., with 150 amperes at 5.4 volts, is 2 pound-feet.

OILING.—Put 4 or 5 drops of light engine oil in each of the starter oilers every month.

GENERATOR.—Generator current regulation is by third brush system.

Amperes	Generator Data. Model 0	R.P.M.
0.00		300 or less
7.50		500 or less
14-18		1000-1300
12.00		2050

Shunt field winding takes 1.3 amperes at 6.5 volts. Armature takes 12 amperes at 6.5 volts, battery pressure applied across main brushes with field disconnected. On earlier generators, before No. 30,000, the field takes 1.7 amperes, and the armature 4 amperes, when tested as above. Air gap between armature and pole pieces is .018 to 0.22 inch. Move third brush in a clockwise direction (looking at commutator end), to decrease charging rate and a counter-clockwise direction to increase it.

OILING.—Put 4 or 5 drops of light engine oil in each of generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 7-10 miles per hour and opens at 5-8 miles per hour. Air gap between relay armature (moving member) and coil core is .040 inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 17 cp. Side lamps are 6-8 volt, 5 cp. Tail lamp is 6-8 volt, 2 cp.

FUSES.—Fuses are 15 ampere.

MODEL NUMBERS.—Magneto is Model P-4. Generator is Model O. Starter is No. 6-A. Lighting switch is No. 25-A.

CHALMERS

MODEL 35B (1916-17). SERIAL NOS. 82,001-90,000

WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM
REMY IGNITION

Plate N . 167

BATTERY.—Battery is 6 volt, 80 ampere-hour. The positive (+) terminal is grounded at the starting motor.

IGNITION.—Breaker contacts separate .015 to .018 inch. When the condition of the points affects the ignition, resurface with a fine, flat jeweler's file or well worn No. 00 sandpaper.

OILING.—Refill the cup under the distributor head with soft cup grease and turn down two turns every two weeks. Put a small amount of vaseline on the fiber bumper of the contact arm, using a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when mark "1 and 6 DC" on flywheel is 1 5/16 inches past indicator, spark control lever and breaker assembly in the fully retarded position. There is a countersunk hole in the rim of the flywheel to aid finding the dead center mark. On early cars this mark is at dead center line, but on later cars it is 1 5/16 inches past dead center, or at the firing point.

FIRING ORDER.—The firing order is 1, 4, 2, 6, 3, 5.

SPARK PLUG GAPS.—Spark plug gaps are .022 to .025 inch.

STARTER.—Frame No. 710. Starter is connected to the engine through a Bendix drive. Starter cranks the engine at 125 R.P.M., taking 275 amperes.

Starter Data		
Torque	R.P.M.	Amperes
0 lb. ft.	4000	40
4 lb. ft.	1000	180
8 lb. ft.	700	280
14 lb. ft.	Lock	450

OILING.—Put 5 or 6 drops of light engine oil in each of the starter oilers every month

GENERATOR.—Frame No. 760. Generator current regulation is by the third brush system. Maximum current output is 15-17 amperes, reached at 1250 R.P.M. of the armature or 16-20 miles per hour.

Generator Data					
Amperes	Cold Test	R.P.M.	Amperes	Hot Test	R.P.M.
0		450	0		500
8		675	6		725
12		840	9		850
15-17		1250	12-14		1250
10		2000	7-8		2000

The cold test readings are obtained with a generator temperature under 95°F. The hot test readings are obtained after the generator has been operated one hour at 1800 R.P.M., charging a half-charged battery. Shunt field current is 2.8 to 3.25 amperes when 6 volts pressure is applied to its terminals. When the generator is operating freely as a motor, current is 3.5 to 5 amperes at 6 to 6.6 volts.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted in the generator frame. Relay closes at 500-550 R.P.M. of the armature or 8-10 miles per hour and opens at 450-500 R.P.M. of the armature or 6-8 miles per hour. Adjust the spring tension on the relay armature so that the contacts open with a discharge current of 0-3 amperes. Adjust the air gap between the relay armature and coil core so that the contacts close when the voltage of the generator reaches 6.2 to 6.5 volts. Air gap between relay armature and coil core is .005 inch, contacts closed. Contacts separate .030 to .035 inch. Resistance of the shunt coil is 68 ohms. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 15 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamp is 6-8 volt, 2 cp.

FUSES.—Large fuse is 30 ampere. Small fuses are 15 ampere.

MITCHELL
Models D-40 and C-42 (1916-17-18)
Remy System
Plate No. 168

Mitchell

D-40 AND C-42 (1916-17-18) REMY GENERATING, STARTING AND LIGHTING SYSTEM REMY IGNITION

BATTERY.—Battery is 6 volt, 110 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Breaker contacts separate .018 to .020 inch. When the condition of the points affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Refill the cup under the distributor head with soft cup grease and turn down two turns every two weeks. At the same time put a small amount of vaseline on the fiber bumper of the contact arm, using a toothpick. If the car is driven more than 500 miles in two weeks, these attentions should be given every 500 miles.

TIMING.—Breaker contacts begin to separate when piston entering power stroke is on top center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .025 to .030 inch.

STARTER.—Starter is connected to the engine through a Bendix drive.

Starter Data. Model No. 304-A			
Torque, lb. ft.	R.P.M.	Amperes	Volts
1	2000	110-130	5.4-5.6
2	1500	165-175	5.1-5.4
4	1000	215-225	4.8-5.2
5	850	265-275	4.6-4.9
6	600	325-335	4.3-4.5
15	Lock	540-560	3.5-3.65

OILING.—Put 5 or 6 drops of light engine oil in each of the starter oilers every month.

GENERATOR.—Generator current regulation is by third brush system. A thermostat, located in the brush rigging of the generator, cuts in a resistance at a temperature of 175°F., reducing the maximum charging rate 6 amperes. Resistance also acts as a shunt field fuse. The thermostat is intended to change the charging rate as demand of seasons or car operation requires. Never touch the thermostat points.

Generator Data. Model 232-A			
Amperes	R.P.M.		Volts
0	515		6.4
7	745		7.1
14	1000		7.9
22	1800		8.6
17	2500		8.2
10	3500		7.4

Above tests made with relay in circuit and thermostat points closed. Position of third brush is adjustable by means of a rack and pinion movement operated by turning a screw exposed at commutator end of generator. Turn screw in a clockwise direction (looking at commutator end), to increase the charging rate, and in a counter-clockwise direction to decrease the charging rate. Brush tension on main brushes is 17 to 20 ounces. Brush tension on third brush is 13 to 17 ounces. Field winding takes 5 amperes at 6.4 volts.

OILING.—Put 4 or 5 drops of light engine oil in each of the generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 7-9 miles per hour and opens at 5-7 miles per hour. Gap between relay contacts is .012 inch to .015 inch. Air gap between armature (moving member) and coil core is .012 inch to .015 inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 17 cp. Tail lamp is 6-8 volt, 2 cp.

MODEL NUMBERS.—Starter is No. 304-A. Generator is No. 232-A. Ignition Coil is No. 284-B. Relay is No. 264-A. Combination Switch is No. 403-A.

LEXINGTON

MODEL 6-0, 600 (1916-17)

WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM CONNECTICUT IGNITION

BATTERY.—Willard Type LBA., No. 5-6, 6 volt, 80 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Breaker contacts separate .023 inch. They are made of tungsten. When the condition of the points affects the ignition, renew the inner breaker mechanism. For temporary service, resurface contacts with fine emery cloth.

OILING.—Refill the cup under the breaker head with pure vaseline and turn down every month. If car is driven more than 1000 miles in a month, this must be done every 1000 miles. Do not put grease or oil in the cup.

TIMING.—Breaker contacts begin to separate when mark "DC 1-6" on flywheel is at indicator, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .027 to .030 inch.

STARTER.—Starter is connected to engine through a Bendix drive. Torque is 2 pound-feet, armature revolving at 1500 R.P.M. Lock torque is 11.5 pound-feet, current being 400 amperes.

OILING.—Refill starter oil wells with light engine oil once a month.

GENERATOR.—Frame No. 400-R. Generator voltage regulation is by vibrating regulator. Maximum charging rate is 16-20 amperes, decreasing to 5-6 amperes as battery becomes fully charged. Maximum voltage is reached at 15 miles per hour.

Generator Data. Frame No. 400

Battery Charging Current Without Lamp Load			Battery Charging Current With 7 Ampere Lamp Load		
Volts	Amperes	M.P.H.	Volts	Amperes	M.P.H.
6.5	2	10	6.3	0	12
6.5	8	15	6.5	4	15
7.0	12	20	6.6	6	20
7.0	12	25	6.7	7	25
			6.7	7	30

Above rates are with battery solution of 1.250.

OILING.—Put several drops of light engine oil in each of generator oilers every two weeks. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.

RELAY-REGULATOR.—Relay and regulator are combined into one unit. Relay closes at 7-10 and opens at 5-7 miles per hour. Charging current is 1 to 3 amperes at closing, and the discharge current is 0 to 1 ampere at opening of relay. Clean relay contacts by drawing unglazed paper between them. If badly worn or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 cp., gas filled. Dimmer lamps are 6-8 volt, 8 cp. Dash lamp is 6-8 volt, 4 cp. Tail lamp is 6-8 volt, 4 cp.

FUSES—Head lamp fuses are 15 ampere. Tail lamp fuse is 5 ampere.

Plate No. 170

National

SERIES AA (1915) (SERIAL NOS. 10,000 TO 10,250) REMY GENERATING, STARTING AND LIGHTING SYSTEM EISEMANN IGNITION

BATTERY.—Battery is 6 volt, 100 ampere-hour. The two-wire system is used.

IGNITION.—Breaker contacts separate .016 inch. When the condition of the points affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Put 2 or 3 drops of light engine oil in each of magneto oilers every month. If car is driven more than 1000 miles in a month, the oiling must be done every 1000 miles.

TIMING.—Breaker contacts begin to separate when the dead center mark on flywheel is $1\frac{1}{4}$ inches before the indicator, spark control lever and breaker assembly in the fully advanced position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .030 inch.

STARTER-GENERATOR.—Starter and generator are combined into one frame but are electrically separate. Starter is connected to the engine through an overrunning clutch and Oldham coupling.

Starter Data. Motor-Generator No. 150A

Torque	R.P.M.	Amperes	Volts
0 lb. ft.	300	40-50	6.0
8 lb. ft.	175	80-90	5.9
16 lb. ft.	125	110-120	5.8
24 lb. ft.	100	135-140	5.7
32 lb. ft.	90	150-170	5.6

GENERATOR.—Generator current regulation is by vibrating regulator

Generator Data. Motor-Generator No. 150-A

Amperes	R.P.M.	Volts
0.0	525-600	6.2-6.4
7.5	750-825	6.8-7.0
13.5	950-1050	7.2-7.4

OILING.—Put 5 or 6 drops of light engine oil in starter generator oilers every two weeks. Lubricate the gears and overrunning clutch with heavy oil or light grease. If car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

RELAY-REGULATOR.—Relay closes at 8-10 miles per hour and opens at 6-8 miles per hour. The air gap between relay armature (moving member) and coil core is .012 to .015 inch, contacts closed. Contacts separate .012 to .015 inch. Clean relay and regulator contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service. Increasing spring tension on regulator armature will increase the output. Decreasing the spring tension will decrease the output.

LAMPS.—Head lamps are 6-8 volt, 15 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are each 6-8 volt, 2 cp.

FUSES.—There is a 15 ampere fuse on relay regulator base. Use commercial 15 ampere fuse wire in replacing it.

MODEL NUMBERS.—Starter-Generator is No. 150-A. Relay-Regulator is No. 60-A. Lighting Switch is No. 142-A. Magneto is Model G-N.6.

Plate No. 171

LEXINGTON MODELS 4-K AND 6-L (1915) WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM WESTINGHOUSE IGNITION

BATTERY.—Battery is 6 volt, 100-ampere-hour. The positive (+) terminal is grounded at the starting motor.

IGNITION.—The ignition system and generator are combined into one unit. The breaker is operated directly from the armature shaft. The centrifugal weights perform the double duty of closing the breaker contacts and automatically advancing and retarding the spark in relation to the engine speed. When the engine is not running and one of these weights is depressing the fiber bumper, the air gap between the bumper lever and stop is $\frac{3}{64}$ inch. This distance must be correct before the contact gap is adjusted. Breaker contacts separate .005 to .006 inch when the contact arm or bumper lever is resting on the stop. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

TIMING.—To time the generator to the engine, first turn the engine until the piston in No. 1 cylinder is on top dead center entering power stroke. Then remove the distributor plate and turn the generator armature back until the mark on the distributor brush holder lines up with the mark on the end bracket. Connect to engine in this position and wire spark plugs to distributor in accordance with the firing order.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .020 to .025 inch.

STARTER.—Frame 300 or 310. Starter is connected to the engine through a Bendix drive. Running freely, starter takes 30-40 amperes at 5.25 volts, armature revolving at 8000 R.P.M. Frame 300 starter delivers $1\frac{1}{4}$ pound-feet torque at 2000-2350 R.P.M., taking 110 amperes at 5.25 volts. Frame 310 starter delivers 2 pound-feet torque at 2100-2425 R.P.M., taking 160 amperes at 5.25 volts. Lock torque of Frame 300 is 4 pound-feet, current being 250 amperes. Lock torque of Frame 310 is 6 pound-feet, current being 375 amperes.

OILERS.—Put 4 or 5 drops of light engine oil in each of the starter oilers every month.

GENERATOR.—Frame 230 or 240. Generator current regulation is by reverse series field. The current taken by the lamps flows through the series field and automatically increases the generator output.

Generator Data			
Frame 230		Frame 240	
Amperes	R.P.M.	Amperes	R.P.M.
0	400	0	425
8	625	8	650
13-16.5	1500	10-13.5	1500
Hot Test			
12-15.0	1500	8.5-11.5	1500

OILING.—Put 4 or 5 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 400-450 R.P.M. of the armature or 8-10 miles per hour and opens at 350-400 R.P.M. of the armature or 6-8 miles per hour. Relay closes when the voltage of the generator reaches 7-7.5 volts, with the battery disconnected. Relay opens with a discharge current of 0-2 amperes. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 15-17 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 4 cp.

FUSES.—Lighting fuses are 15 ampere.

MICHIGAN, PULLMAN AND WARREN CARS

Plate No. 172

Maxwell (1915)

Gray and Davis Starting and Lighting System Simms Magneto Ignition

Battery.—Battery is 6 volt, 100-ampere-hour. The positive (+) terminal is grounded at starting switch. There is an auxiliary set of four dry cells to aid in starting.

Ignition.—Magneto breaker contacts should open .014 inch to .016 inch.

Timing.—Magneto should be so timed that when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position, the contacts will be just beginning to separate.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plug Gaps.—The spark plug gap is .020 inch to .023 inch.

Oiling.—Once every month put 3 or 4 drops of light machine oil in each of the magneto oilers. If the machine is driven more than 1000 miles in a month, the oiling must be done every 1000 miles. When the starting switch is moved to the starting position, the dry cells are connected into the magneto primary circuit, to aid starting.

Starter.—The starter is connected to the flywheel through a mechanical pinion shift, as described on Page No. 198. Every two weeks put 8-10 drops of light engine oil in each of the motor oilers. The starter gear case should receive one tablespoonful of heavy engine oil once every two months. Oil sliding surfaces frequently.

Generator.—Generator voltage regulation is by a vibrating regulator. The relay is combined with the regulator.

Care.—Clean regulator contacts by drawing a piece of soft paper between them. Should they become badly burned or corroded, they may be resurfaced with a piece of well worn No. 00 sand paper. Do not use this latter method unless it is necessary, as it will change the output.

Adjustment.—To adjust regulator, hold upper contacts open and adjust the lower contacts until the desired output is attained. Then open the lower contacts and adjust the upper set, until the desired output is reached. Then allow both sets of contacts to operate. The output should be the desired amount.

Charging Rate.—The maximum charging rate should be about 10-12 amperes at 12-14 miles per hour. When the lights are turned on, the frequency at which the regulator contacts operate is automatically decreased, as described on Page No. 199, thus increasing the output, maintaining practically a constant charging rate at a given speed, whether lights are "On" or "Off." Dirty contacts will cause a low output. The charging rate will vary with the state of charge of the battery.

Oiling.—Once every two weeks put 8 or 10 drops of light engine oil in each of the generator oilers. If the machine is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Lamps.—Head lamps are 6-8 volts, 15 cp. Tail lamp is 6-8 volts, 2 cp.

Plate No. 173

Maxwell

(1914-15)

Simms-Huff Starting and Lighting System Simms Magneto Ignition

Battery.—Battery is 12 volt, 85 ampere-hour. The negative (—) terminal of one set of three cells is permanently grounded. The negative (—) terminal of the other set of three cells is grounded when the starting switch is in the normal generating position.

Ignition.—Two different types of magnetos were supplied; an independent type (1914) and a dual type (1915). The connections of these magnetos are shown below. Internal circuits of the dual magnetos are shown on the next page. Contacts should separate .015 inch.

Care.—Clean them with gasoline frequently. Should they become badly burned or pitted, resurface them with a fine, flat jeweler's file, or a small strip of worn No. 00 sand paper.

Timing.—Contacts should begin to separate when top dead center mark on the flywheel is $1\frac{1}{4}$ inches past the indicator, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plug Gaps.—The spark plug gap should be .020 inch to .023 inch.

Oiling.—Put 3 or 4 drops of light machine oil in each of the magneto oilers every month. If the car is driven more than 1000 miles in a month, oiling must be done every 1000 miles.

Starter.—The starter and generator are combined into one unit. The starter is connected to the engine by a set of gears shifted by the operator. When operating as a generator the armature is driven by the fan belt. Belt should be loose enough to allow the pulley to slip when armature is running as a motor, yet tight enough to drive it definitely as a generator. Motor should develop 24 foot pounds lock torque.

Generator.—Generator output regulation is by combined vibrating regulator, mounted on the dash, and reverse series field.

Charging Rate.—The maximum charging rate should be 10-15 amperes, reached at 16-18 miles per hour.

Care.—Should the regulator contacts stick or fail to operate properly, the ammeter will indicate a high charging rate. Should the ammeter indicate the limit on the discharge side when engine is stopped, relay contacts are sticking. Further instructions for the testing and repair of the motor-generator are given on the next two pages.

Oiling.—Put several drops of light engine oil in each of the motor-generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.

Lamps.—Head lamps are 6-8 volts, 15 cp. Tail lamp is 6-8 volts, 2 cp.

Fuses.—Lighting fuses are 20 ampere.

Maxwell (1916-17), Simms-Huff Starter, Simms Magneto Ignition

Plate No. 174

Maxwell

(1916-17)

Simms-Huff Starting and Lighting System Simms Magneto Ignition

Battery.—Battery is 12 volt, 35 ampere-hour. The negative (—) terminal of one set of three cells is permanently grounded. The negative (—) terminal of the other half of the battery is grounded when the starting switch is in the generating position.

Ignition.—Magneto breaker contacts should open .015 inch.

Care.—Clean contacts with gasoline frequently. Should contacts become badly burned or pitted, they should be resurfaced with a very fine, flat jeweler's file or a small strip of worn No. 00 sand paper.

Timing.—The breaker contacts should begin to separate when the upper dead center mark on the flywheel is $1\frac{1}{4}$ inches past the indicator, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plug Gaps.—The proper spark plug gap is .020 inch to .023 inch, no wider.

Oiling.—Put 3 or 4 drops of light machine oil in each of the magneto oilers every month. If the machine is driven more than 1000 miles per month, the oiling must be done every 1000 miles.

Starter.—The motor and generator are combined into one unit. When the starting pedal is depressed the pinion on the rear end of the motor-generator shaft is drawn into mesh with the flywheel gear and the two halves of the battery connected in series and to the motor windings of the unit. The motor-generator then runs as a motor, cranking the engine. When the starting pedal is released, a spring draws the pinion out of mesh and the armature is driven as a generator by the fan belt. The motor should develop 24 foot pounds lock torque. The starting switch is also provided with two terminals to connect the dry cells into the magneto circuit to aid starting. The machine acts as a cumulative-compound wound motor, that is the current flows through both the shunt and the series windings, producing increased torque. There are three series coils, wound on alternate poles. Each coil is grounded to the frame at its inner end.

When the starting pedal is released, the switch automatically connects the two halves of the battery in parallel, thus forming a 6 volt battery. Generator operates at 6.5-7 volts pressure.

Generator.—The voltage regulation is by a combined vibrating regulator and reverse series field. The regulator is mounted on the dash. The maximum charging rate should be 10-15 amperes, charging the two halves of the battery in parallel. This rate should be reached at 16-18 miles per hour. If the regulator contacts stick, or fail to operate properly, a very high charging rate will be indicated on the ammeter. Should the ammeter indicate the limit on the "Discharge" side of the scale when the engine is stopped, the relay contacts are probably sticking.

Plate No. 175

Murray Eight

1917-18

Westinghouse Starting and Lighting System Dixie Magneto Ignition

Battery.—Battery is 6 volt, 100 ampere-hour. The positive (+) terminal is grounded.

Ignition.—Magneto breaker contacts should open .018 inch to .022 inch. Clean contact with gasoline whenever necessary. Should contacts become badly burned or pitted, they must be resurfaced with a fine, flat jeweler's file or a piece of worn No. 00 sand paper. Full directions for the care and adjustment of the magneto are given on Page 189.

Timing.—Breaker contacts should begin to separate when the top dead center mark on the flywheel is 1 inch past the indicator, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1R, 1L, 3R, 3L, 4R, 4L, 2R, 2L.

Spark Plug Gaps.—Spark plug gaps should be .020 inch to .025 inch.

Oiling.—Fill oil cup every month. If car is driven more than 1000 miles in a month, the oiling must be done every 1000 miles.

Starter.—Starter is connected to the engine through a Bendix drive. The motor should develop about 14 foot pounds lock torque.

Oiling.—Put 3 or 4 drops of light engine oil in each of the motor oilers every month.

Generator.—Generator voltage regulation is by a vibrating regulator. Relay should close at 8-10 miles per hour and open 6-8 miles per hour. The maximum generator output should be reached at 25-30 miles per hour. It should remain practically constant at all higher speeds. As the regulator holds the generator voltage constant at these speeds, the generator output will vary with the state of charge of the battery. When the battery is nearly discharged the output will be as high as 15-20 amperes, but this rate will be gradually reduced to 5-8 amperes when the battery is fully or nearly fully charged.

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Lamps.—Head lamps are 6-8 volts, 17-20 cp. Dimmer lamps (when supplied) are 6-8 volts, 5-7 cp. Dash and tail lamps are 6-8 volts, 2 cp. Tonneau lamp is 6-8 volts, 2-4 cp.

Fuses.—Fuses are 15 amperes.

Austin

1917-18. 12 Cylinder Model. D Ico Starting-Lighting System. Delco Ignition

Battery.—Battery is 6 volt, 115 ampere-hour. The negative (—) is grounded.

Ignition.—There are two distributors, ignition coils and breakers, thus forming two separate ignition systems, one for each cylinder block.

Timing.—Breaker contacts should open .018 inch to .020 inch. If they become badly burned or pitted, resurface them with a very fine flat jeweler's file or a piece of worn No. 00 sand paper. Contacts should begin to separate when the piston entering power stroke is on top dead center spark control lever within one inch of the fully retarded position.

Firing Order.—The firing order is 1R, 1L, 4R, 4L, 3R, 3L, 6R, 6L, 2R, 2L, 5R, 5L.

Oiling.—Put 4 or 5 drops of light engine oil in each of the oil holes beneath the cover on top of the distributor every two weeks. If the car is driven more than 500 miles in two weeks, oil every 500 miles. Clean out and repack lower distributor ball bearing with light cup grease three times each season. Put a little vaseline on the breaker cam every month.

Spark Plug Gaps.—The spark plug gap should be .028 to inch to .030 inch.

Starter.—Starter No. 86 is connected to the engine through a Bendix drive. Put two or three drops of light engine oil in the motor oilers every month. When running free, the motor should not take more than 40 amperes. It should deliver at least 16 foot pounds lock torque. These ratings are assumed at a terminal voltage of not less than 3.5 volts or over 3.8 volts, motor in operation.

Generator.—Generator voltage regulation is by third brush system. The negative (—) generator brush is grounded. Relay should close at 8-10 M. P. H., or about 500 R. P. M., of the generator. The following is the test schedule of the Model No. 87 generator:

Windings Cold—R.P.M.	Amp.	Windings Hot—R.P.M.	Amp.
500 or less	0	500	0
900	11.5-13.5	900	11-13
1400	16.5-19.5	1400	16-18
1800	15.5-18.5	1800	15-17
2000	15 18	2000	14-16

Charging Rate.—Charging rate should be 14-15 amperes at 20-22 miles per hour. This rate reduces to about 9 amperes at 45 miles per hour. Once every two weeks put 4 or 5 drops of light engine oil in each generator oilers. If car is driven more than 500 miles in two weeks, oil every two weeks. The generator is disconnected from the battery when the ignition switch is in the "Off" position. A relay is also supplied.

Lamps.—Large head lamps are 6-9 volts, 17 cp. Dimmer lamps are 6-8 volts, 5-6 cp. The small head lights are 6-8 volts, 2 cp. Dash and tail lights are 6-8 volts, 2-4 cp.

Circuit Breaker.—A circuit breaker in the lighting and ignition switch takes the place of fuses in the lighting circuits. Vibrating of this device indicates a ground in the lighting circuits.

Model Numbers.—Generator is No. 87; motor is No. 86; starting switch is No. 1965; combination lighting and ignition switch is No. 1085; cutout relay is No. 5715; a meter is No. 6064; ignition coil is No. 2123; distributor is No. 5156.

Austin, 12-Cylinder Model (1917-18). Delco System
Plate No. 176

MERCER

U. S. L. GENERATING, STARTING AND LIGHTING SYSTEM

SERIES 22-70 (1915)

BOSCH IGNITION

Mercer, Series 22-70 (1915), U.S.L. Generator, Bosch Ignition
Plate No. 177

Battery.—Battery is 12 volt, 85 ampere-hour. The negative (—) terminal is grounded by the wire leading from the starter terminal block, to circuit breaker and then to ground through fuse.

Ignition.—Magnet breaker contacts should open .014 inch to .016 inch. Should they become badly burned or pitted, resurface them with a fine flat jeweler's file, or a small strip of worn No. 00 sand paper. Clean them with gasoline whenever necessary. Further directions for the care of the magneto are given on Page No. 184.

Timing.—Magnet should be set so that the fiber bumper is on the highest part of the cam when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plug Gaps.—Spark plug gaps should be .018 inch to .023 inch.

Oiling.—Put 3 or 4 drops of light machine oil in each of the magneto oilers every two weeks. At the same time put a very small amount of vaseline on the fiber bumper of contact arm. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Motor-Generator.—The motor-generator is located at the rear of the engine, the armature being fastened to the crankshaft, taking the place of the flywheel.

Generator.—Generator current regulation is by reverse series field and compensating field. There is only one adjustment on the generator, that is the spring tension on the brushes. The top and two of the lower brushes are used for the generator. Five bottom brushes are used when motoring. The two brushes located, one on either side of the top brush, are field brushes. Spring tension on the generator brushes should be 1 3/4 pounds. Spring tension on the other brushes should be 1 1/4 pounds. This pressure can be measured with a common hand scale, of the spring type. Relay should close at about 10 miles per hour. The maximum charging rate should never exceed 18 amperes at the highest engine speed.

Lamps.—Head lamps are 12-16 volts, 18 cp. Dash lamp is 12-16 volts, 4 cp. Tail lamp is 12-16 volts, 2-4 cp.

Fuses.—There are two fuses on the relay base. The larger, 30 ampere fuse, is in the charging circuit. The smaller 5 ampere fuse, is in the shunt field circuit. There is also a 30 ampere fuse in the light return or ground circuit.

Plate No. 178

MERCER

SERIES 4 (1918)

WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM BERLING IGNITION

BATTERY.—Willard, Type SJR-6, 6 volt, 163 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Berling Magneto, Type F-41. Breaker contacts separate .016 to .020 inch. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Put 10 drops of light engine oil in each oil cup every month. Put a small amount of vaseline on the cam and rubbing surface of the fiber lever, applying with a toothpick. If the car is driven more than 1000 miles in a month, these attentions must be given every 1000 miles.

TIMING.—Magneto breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 3, 4, 2.

SPARK PLUG GAPS.—Spark plug gaps are .016 to .020 inch.

STARTER.—Frame 700. Starter is connected to the engine through a magnetically shifted pinion. The starting switch is of the magnetic type, controlled by a push button on the dash. Lock torque developed by the starter is 12.5 pound-feet, current being 400 amperes. Torque at 1200 R.P.M. is 2.5 pound-feet.

OILING.—Put 5 or 6 drops of light engine oil in each of the starter oilers every month.

GENERATOR.—Frame 760-R, Style 287,842. Generator voltage regulation is by combined magnetic and mechanical cam regulator. Maximum output of generator is 12 amperes at 6.5-7 volts, reached at 1800 R.P.M. of the armature or 25 miles per hour. On open circuit, generator voltage is 8.0 at 1800 R.P.M. To adjust the cam regulator, loosen the nut C and turn the screw D until the air gap between D and E is .003 inch, when the rider B is on the highest point of the cam A. Further adjustment to obtain the specified action is made by bending the stop F. Resistance of regulator winding is 10 ohms. Resistance of the part of the resistor which is in series with the regulator coil is 10 ohms. Resistance of the part of the resistor connected across the contacts is the armature or 6-8 miles per hour, and opens at 425-475 R.P.M. of the armature or 5-7 miles per hour. Adjust the armature stop so that the relay contacts open when the discharge current is 0-3 amperes. Adjust the spring tension so that relay closes when the voltage of the generator reaches 5.8 to 6.1 volts, battery disconnected. Air gap between relay armature and coil core is .005 inch, contacts closed. Contacts separate .012 to .018 inch. Resistance of the shunt coil with resistor is 56.5 ohms. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dimmer lamps are 6-8 volt, 5 cp. Dome and pillar lamps are 6-8 volt, 4 cp. Dash lamp is 6-8 volt, 3 cp. Tail lamp is 6-8 volt, 5 cp.

FUSES.—Fuses are 20 ampere.

Plate No. 179

HAYNES MODELS 30, 33, 34 AND 35 (1915-16) LEECE-NEVILLE GENERATING, STARTING AND LIGHTING SYSTEM REMY IGNITION

BATTERY.—Battery is 6 volt, 100 ampere-hour. There is also a set of 6 dry cells for auxiliary ignition purposes. The negative (—) terminal of storage battery and dry cells is grounded.

IGNITION.—Breaker contacts separate .018 to .020 inch. When the condition of the contacts affects the ignition, resurface with well worn No. 00 sandpaper or a fine, flat jeweler's file.

OILING.—Refill the grease cup under the breaker head with soft cup grease and turn down two turns every two weeks. If the car is driven more than 500 miles in two weeks this must be done every 500 miles.

TIMING.—Breaker contacts begin to separate when piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 4, 2, 6, 3, 5.

SPARK PLUG GAPS.—Spark plug gaps are .020 to .025 inch.

STARTER.—Type B-300. Starter is connected to the engine through a pinion shifted by the operator. Starter cranks the engine at 125-150 R.P.M., taking 200 amperes.

OILING.—Put 4 or 5 drops of light engine oil in each of the starter oilers every month.

GENERATOR.—Type B-400. Generator current regulation is by third brush system. Maximum charging rate is 16 amperes, reached at 1200 R.P.M. of the armature or 20 miles per hour. Move the third brush in the direction of armature rotation to increase charging rate and in the opposite direction to decrease the charging rate. Reseat the brush after adjusting position.

OILING.—Put 4 or 5 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 8-10 miles per hour or 450-500 R.P.M. of the armature and opens at 6-8 miles per hour or 400-450 R.P.M. of the armature. Relay contacts separate 3/64 inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 16 cp. Dimmer lamps, when supplied, are 6-8 volt, 4 cp. All other lamps are 6-8 volt, 2 cp.

FUSES.—There is a 5 ampere fuse on the relay base to protect the generator field windings.

CIRCUIT BREAKER.—A locking circuit breaker takes the place of fuses in the lighting and ignition circuits. A current of 25 amperes will cause the circuit breaker to operate.

Model 38, 39, 39R, 39S. (1918)

Leece-Neville Starting and Lighting System. Remy Ignition
Battery.—Battery is 6 volt, 100 ampere-hour. The two wire system is used.

Ignition.—Breaker contacts should open .018 inch to .020 inch.

Care.—If they become badly burned or pitted, resurface them with a fine, flat jeweler's file or a small strip of worn No. 00 sand paper. Every month put a small trace of vaseline on the fiber bumper.

Timing.—Contacts should begin to separate when the top dead center mark on the fly-wheel is 1 inch past the indicator, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 4, 2, 6, 3, 5.

Spark Plug Gaps.—The proper spark plug gap is .020 inch to .025 inch.

Oiling.—Use soft cup grease in the grease cup under the distributor head and turn down two turns every two weeks. If the car is driven more than 500 miles in two weeks, screw down the grease cup every 500 miles.

Starter.—The starter is connected to the engine through a Bendix drive. Put several drops of light engine oil in each of the motor oilers every month. The starter should crank the engine at a speed of 125 to 150 R. P. M. Although the motor may take as large a current as 550 amperes when starting to turn the engine over, the current during full cranking speed should not exceed 200-225 amperes.

Generator.—Voltage regulation is by third brush system. The third brush is adjusted by turning the thumb nut, on the commutator end of the generator, with a pair of pliers. Relay is mounted on the generator. Relay should close at 6-8 and open at 5-7 miles per hour, high gear car speed.

Charging Rates.—The maximum charging rate should not exceed 16 amperes. The maximum rate should be reached at 18-20 miles per hour.

Fuse.—There is a 5 ampere fuse in shunt field circuit, on relay base. Should this fuse burn out, look first for open circuits or defective connections in the charging circuit.

Trouble Shooting.—To test the field windings, lift the third brush and impress 6 volts on the field terminals. If the current flow is more than 4 amperes a short or ground exists. If less than 4 amperes flow look for broken wires or poor connections. Before replacing a burned fuse, always locate the fault which caused it to melt. Brushes which do not move freely in their holder will cause this fuse to burn out.

Lamps.—Head lamps are 6-8 volts, 16 cp. Dimmer lamps are 6-8 volts, 12 cp. Dash lamp is 6-8 volts, 2 cp. Tail lamp is 6-8 volts, 2 cp. Dome lamp is 6-8 volts, 4 cp. Tonneau lamp is 6-8 volts, 2-4 cp.

Circuit Breaker.—Circuit breaker takes the place of fuses in the lighting and ignition circuits.

APPERSON
MODEL 4-40 AND 6-45 (1914-15)
BIJUR STARTING AND LIGHTING SYSTEM
EISEMANN IGNITION

Plate No. 181

Battery.—Battery is 6 volt, 85 ampere-hour. The two wire system is used.

Ignition.—Magneto breaker contacts should open .014 inch to .018 inch.

Care.—Clean them with gasoline frequently. Should the contacts become badly burned or pitted, they should be resurfaced with a very fine, flat jeweler's file or a strip of worn No. 00 sand paper.

Timing.—Contacts should be just beginning to separate when the top dead center mark on the flywheel is $\frac{1}{2}$ inch to 1 inch past the indicator, spark control lever and breaker assembly in the fully retarded position.

Spark Plug Gaps.—The proper spark plug gap is .025 inch to .030 inch.

Oiling.—Put 3 or 4 drops of light machine oil in each of the magneto oilers every two weeks. If the machine is run more than 500 miles in two weeks, the oiling must be done every 500 miles.

Firing Order.—The firing order of the 1914-15 four cylinder cars is 1, 3, 4, 2. The firing order of the six cylinder cars is 1, 5, 3, 6, 2, 4.

Starter.—The starter is connected to the engine by a Bendix drive or what is known as the non-automatic mechanical pinion shift. In the non-automatic mechanical pinion shift type the pinion is carried on a square shaft. When the starting handle is pulled out, the pinion is moved along the square shaft, and the battery is connected to the motor in series with a resistance, causing it to turn slowly, to facilitate the meshing of the gears. After the pinion is meshed with the flywheel gear, the resistance is cut out of the circuit by the moving contact, thus applying full battery pressure to the motor, cranking the engine. When the handle is released a spring demeshes the gears.

Oiling.—Every two weeks put 2 or 3 drops of light engine oil in each of the motor oilers and at the same time put a little thin grease on the square shaft. Do not oil the Bendix drive, but clean it with gasoline if the pinion does not work freely.

Generator.—Generator voltage regulation is by third brush system. Relay should close at 10-12 miles per hour.

Output.—The maximum generator output of 14-15 amperes is reached at 17-20 miles per hour. This rate gradually reduces at higher speeds. There is a 20 ampere fuse in the small aluminum cap mounted on the generator.

Fuse.—This fuse is in the shunt field circuit, and will burn out, opening the circuit and rendering the generator inoperative if it is run with the battery disconnected or with a certain amount of resistance in the charging circuit due to loose connections, etc. This fuse should be removed if it is necessary to run the generator with the battery disconnected.

Oiling.—Every two weeks put three or four drops of light engine oil in each of the generator oilers. If the machine is run more than 500 miles in two weeks, the oiling must be done every 500 miles.

Lamps.—On the 1914 cars, head lamps are 6-8 volt, 15 cp. Dash lamp is 6-8 volt, 2 cp. Tonneau lamp (when supplied) is 7 volts, 2-4cp. Tail lamp is 6-8 volt, 2 cp. Side lamp is 6-8 volts, 4 cp. On the 1915 cars, head lamps are 6-8 volts, 18-20 cp. Dash lamp is 6-8 volts, 2 cp. Tail lamp is 6-8 volts, 2cp.

Plate No. 182

BIDDLE

1919

WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM EISEMANN OR SIMMS IGNITION

BATTERY.—Battery is 6 volt, 90 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Breaker contacts separate .015 to .018 inch. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sand paper.

OILING.—Put 4 or 5 drops of light engine oil in the magneto oilers every month. If the car is driven more than 1000 miles in a month, the oiling must be done every 1000 miles.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is at top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 3, 4, 2.

SPARK PLUG GAPS.—Spark plug gaps are .025 inch.

STARTER.—Frame No. 318. Starter is connected to the engine through a Bendix drive. Lock torque is 11.5 pound-feet, current being 400 amperes at 4.25 volts. Torque at 1400 R.P.M. is 2 pound-feet, current being 125 amperes at 5.5 volts. Pressure of brushes on the commutator is 1 1/4 to 1 1/2 pounds.

OILING.—Put 5 or 6 drops of light engine oil in the starter oilers every month.

GENERATOR.—Frame No. 208. Generator current regulation is by reverse series field. Maximum charging rate is 11-15 amperes, reached at 1500 R.P.M. of the armature or 25 miles per hour.

Amperes	Generator Data	R.P.M.
0		425
8		650
11-15		1500

Shunt field current is 1.5-2.5 amperes at 6 to 6.3 volts. Operating freely as a motor, generator takes 2.5-3.5 amperes at 6-6.3 volts. The current taken by the lamps does not pass through the reverse series field, and hence has but little effect on the charging rate.

OILING.—Put 5 or 6 drops of light engine oil in the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted in the generator frame. Relay closes at 425-475 R.P.M. of the armature or 8 miles per hour, and opens at 375-425 R.P.M. of the armature or 6 miles per hour. Adjust relay to open with a discharge current of 0-2 amperes and close when the voltage of the generator reaches 7 to 7.5 volts, battery disconnected. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 15 cp. Dimmer lamps are 6-8 volt, 4 cp. Tail and dash lamps are 6-8 volt, 2 cp.

FUSES.—Fuses are 10 ampere.

Plate No. 183

Apperson

Models 6-48 and 8-58 (1916) Westinghouse Starting and Lighting System Remy Ignition

Battery.—Battery is 6 volt, 80 ampere-hour. The positive (+) terminal is grounded.

Ignition.—Breaker contacts should separate .020 inch to .025 inch. Should they become badly burned or pitted, resurface them with a fine, flat jeweler's file or a small strip of worn No. 00 sand paper.

Timing.—Contacts should begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order of the six cylinder car is 1, 5, 3, 6, 2, 4. The firing order of the eight cylinder car is 1, 6, 3, 5, 4, 7, 2, 8, number one cylinder being the one nearest the radiator on the left hand block and number five cylinder being the one nearest the radiator on the right hand block.

Spark Plug Gaps.—Spark plug gaps should be .028 inch to .030 inch.

Oiling.—Refill the cup under the distributor head with soft cup grease and turn down two turns every two weeks. At the same time put a small amount of vaseline on the fiber bumper of the contact arm, using a toothpick. If the car is driven more than 500 miles in two weeks, these attentions should be given every 500 miles.

The brass base of the ignition coil must be well grounded as it acts as one terminal of the primary ignition circuit.

Starter.—Starter is connected to the engine through a Bendix drive. It should crank the engine about 125 R. P. M. It should deliver 2.5 pound-feet torque when running at 1200 R. P. M. It should deliver 12.5 pound-feet lock torque, taking about 400 amperes.

Oiling.—Once every month put several drops of light engine oil in each of the starter oilers.

Generator.—Generator voltage regulation is by a vibrating regulator. Relay is combined with the regulator. Relay should close at 10-12 miles per hour and open at about 4 miles per hour. Relay contacts should open .013 inch to .018 inch. Clean relay and regulator contacts by drawing a piece of soft paper between them. If they are badly burned or pitted, they may be resurfaced with a strip of worn No. 00 sand paper. The maximum generator output should be reached at about 25 miles per hour. The charging rate will vary with the state of charge of the battery. It may reach as high as 16-20 amperes when battery is in a badly discharged condition. This rate will gradually decrease to 4 or 5 amperes when the battery is nearly fully charged.

Oiling.—Put 3 or 4 drops of light engine oil in each oil the generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Lamps.—Head lamps are 6-8 volts, 18 cp. Dash lamp is 6-8 volts, 2 cp. Tail lamp is 6-8 volts, 2 cp.

Fuses.—Lighting fuses are 10 ampere.

Grant

Models 4 and 6 T (1915-16), V (1916) Allis-Chalmers Starting and Lighting System Atwater-Kent Ignition

Plate No. 184

Battery.—Battery is 6 volt, 80 ampere-hour. The two wire system is used.

Ignition.—Breaker contacts should open .010 inch to .012 inch. To lessen the gap, remove the screw and take off one or more of the thin washers under the head, as required. If tungsten contacts become badly corroded they may be resurfaced by drawing across a piece of fine emery cloth laid on a flat surface as on the bed of a drill press. The polarity switch reverses the current across the breaker contacts every time it is turned on. This tends to keep the contacts true.

Timing.—Spark should occur when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position on the four cylinder car and when the mark "1 and 6 DC" on the flywheel is at the indicator, spark control lever and breaker assembly in the fully retarded position on the six cylinder cars.

Firing Order.—The firing order of the "Four" is 1, 3, 4, 2. The firing order of the "Six" is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—Spark plug gaps should be .025 inch to .030 inch.

Oiling.—Put one drop of light machine oil on the latch and latch lifter bearings and put three or four drops in the main bearings every month. At the same time put a small amount of vaseline on the latch, latch lifter and other moving parts. Care must be taken that no vaseline or oil reaches the tungsten contacts as it will cause them to burn and corrode. If the car is driven more than 1000 miles in a month, the oiling must be done every 1000 miles.

Motor-Generator.—The motor and generator are combined in one frame, forming what is known as the single unit system. Generator current regulation is by reverse series field and vibrating regulator. The relay should close at about 600 R. P. M., of the engine or 10 to 12 miles per hour.

Trouble Shooting.—Should the motor operate properly yet the generator fail to keep the battery charged, the lights may be too large or used excessively, starter used excessively, there is an unintentional ground or a short circuit in the wiring, shunt field is open, relay is not closing, relay contacts are dirty or corroded or the main fuse is burned out or is not making good contact with the clip. Examine particularly the small wire connected to the positive terminal of the battery, the two small wires connected to the motor-generator and the small wire connected to the starting switch. **T test the shunt field** stop engine, remove large fuse and connect the terminal marked "Field" to either end of the small fuse. The ammeter will show a discharge of 3 or 4 amperes if the shunt field is O. K. If the shunt field tests O. K., replace the large fuse, start engine and speed it up to 600-650 R. P. M., then connect the two terminals on the instrument panel marked "Field and Dyn. +"; if this produces no charge, leave them connected together, and also connect the lower clip of the small fuse to the large fuse. These two connections cut the regulator out of the circuit entirely, so this test must not be made with engine running over 650 R. P. M., or under 600 R. P. M. If it is running faster there will be a very large charging current and if running slower there will be a very large discharge current which may damage the ammeter, wiring or other apparatus. If the meter did not indicate charge on any of the other tests but now indicates charge, the regulator is at fault.

Lamps.—Head lamps are 6-8 volts, 14 cp. on the 1915 cars. They take about 2 amperes each. On the 1916 cars the head lamps are 6-8 volts, 17 cp. Dash and tail lamps are both 6-8 volts, 2 cp., and take about .42 ampere each.

Fuses.—The large fuse is 45 ampere. The small fuse is 20 ampere.

WINTON

MODELS 20 AND 21 (1914-15)

GRAY & DAVIS GENERATING, STARTING AND LIGHTING SYSTEM BOSCH OR MEA IGNITION

Plate No. 185

BATTERY.—Battery is 6 volt, 80 ampere-hour on the Model 20 cars, and 6 volt, 120 ampere-hour on the Model 21 cars. The positive (+) terminal is grounded at the cutout relay on the Model 20 cars having no electric starter. On Model 21 cars, equipped with electric starter, the positive (+) terminal is grounded at the motor or starting switch.

IGNITION.—Breaker contacts separate .014 to .016 inch. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper. Bosch Dual Ignition system is fully treated on Page 182 and the Mea system on Page 176.

OILING.—Put 2 or 3 drops of light machine oil in each of the magneto oilers every two weeks. Put a small amount of vaseline on the fiber bumper on the contact arm, applying with a toothpick. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

TIMING.—Contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .015 to .020 inch.

STARTER.—Model H1. Starter is connected to the engine through a pinion shifted by the operator. There is an overrunning clutch to prevent the engine driving the starter. Starter takes 150 amperes at 6 volts, armature revolving at 1500 R.P.M.

OILING.—Lubricate the sliding parts and bearings with light engine oil every two weeks. Thoroughly clean out and repack the starter bearings with soft cup grease every six months.

GENERATOR.—Model E. Generator output regulation is by mechanical speed control. The governor is of the shoe-and-shell type, and should be so adjusted that the armature will be driven at 1000 R.P.M. at all speeds above ten miles per hour. Generator output is 9 amperes at 6.5 volts when driven at 1000 R.P.M. At a speed of 12 miles per hour, with all lights on, ammeter indicates .5 to 2 amperes "Charge" and with lights off, from 3 to 8 amperes. The governor is adjustable by means of a screw which is accessible through openings in the shoes and shell. These openings must first be brought into alignment with each other. A narrow screw driver is then inserted. Turn the adjusting screw to the right to increase the output of the generator and to the left to decrease the output. The generator operates as a simple shunt-wound machine except when supplying current to the lights, when it is compounded to increase the output. In case the governor mechanism is worn out, the generator's connections may be altered to give reverse series field regulation. To make this change follow instructions given on Page 188.

OILING.—Put 6 or 8 drops of light engine oil in the three bearing oilers every two weeks. On machines still using the governor clutch, the governor arm bearings must be oiled with light engine oil at the same time. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 10 miles per hour and opens at 8 miles per hour. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 15 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp. All other lamps are 6-8 volt, 4-6 cp.

FUSES.—Fuses are 10 ampere.

Bijur Starting and Lighting System
Bosch Magneto Ignition

WINTON
MODELS 22 AND 22-A (1916-17)
BIJUR STARTING AND LIGHTING SYSTEM
BOSCH MAGNETO IGNITION

Plate No. 186

Battery.—Battery is 6 volt, 100 ampere-hour. The positive (+) terminal is grounded at the starting motor.

Ignition.—Magneto breaker contacts should open .014 inch to .016 inch.

Care.—Should they become badly burned or pitted, resurface them with a very fine, flat jeweler's file or a small strip of worn No. 00 sand paper. Duplex ignition is fully described on Page No. 185.

Timing.—Breaker contacts should begin to separate when the piston entering power stroke is on top dead center, spark control lever about $\frac{1}{2}$ inch from the fully retarded position. (See that breaker assembly is nearly fully retarded when lever is in this position.)

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—Spark plug gaps should be about .018 inch to .020 inch.

Oiling.—Every two weeks put 2 or 3 drops of light machine oil in magneto oilers. If the machine is driven more than 500 miles in two weeks, the oiling should be done every 500 miles.

Starter.—On the Model 22 cars, the starter is connected to the engine by a pinion shifted by the operator. This device is described on Page No. 8. On the Model 22-A cars, the power is transmitted through a Bendix drive.

Oiling.—Every two weeks put 2 or 3 drops of light machine oil in each of the motor oilers and also grease the shaft on the Model 22 cars.

Repairs.—If it is desired to remove the motor for repairs and keep the car in service, first disconnect one cable from the battery, to avoid accidental shorts, then remove wires A and B (Plate 271) from the motor, connect them together and tape well, finally remove the wire D from the motor and tape its end. Fasten all wires securely.

Generator.—Generator voltage regulation is by a vibrating regulator mounted on top of the generator. Relay is combined in the same case as the regulator. Relay should close at 10-12 miles per hour and open at 8-10 miles per hour.

Charging Rate.—When the battery is nearly discharged the charging rate may reach as high as 15 to 25 amperes. As battery is charged, this rate will gradually reduce to 4 or 5 amperes. The maximum charging rate should be reached at 12-15 miles per hour and remain practically constant at all higher speeds. Maximum generator voltage should be 7.3 to 7.4 volts, reached at 14 or 15 miles per hour.

Care.—Directions for the removing of the regulator are given on Page 8. Once every month the disconnecting plug on the rear of the regulator box should be pushed in to unlock it and turned half a turn, until it springs forward and locks. This reverses the current across the regulator contacts, which tends to keep them true.

Oiling.—Once every two weeks put 4 or 5 drops of light machine oil in each of the generator oilers. If the machine is run more than 500 miles in two weeks, the oiling must be done every 500 miles.

Lamps.—Head lamps are 7-7½ volts, 15-24 cp. Dimmer lamps are 7½-8 volts, 8-12 cp. All other lamps are 7½-8 volts, 2-4 cp.

Fuses.—Light and horn circuits are independently fused. Fuses are 15 amperes.

Winton, Model 21-A

Winton, Model 22, Limousine

Regal

Models D and R (1915) Rushmore Starting and Lighting System Atwater-Kent Ignition

Plate No. 188

Battery.—Battery is 6 volt, 85-ampere-hour. The negative (—) terminal is grounded.

Ignition.—Breaker contacts should open .010 inch to .012 inch.

Care.—Should contacts become badly burned or pitted, remove them and resurface by drawing across a piece of fine emery cloth laid on a very flat surface, as on the bed of a drill press, finishing on an oil stone. To lessen the gap, remove contact screw and take off one or more as required of the thin washers under the head. The contact opening must never be less than .010 inch.

Timing.—Contacts should begin to separate when the top dead center mark on the flywheel is at the indicator, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 2, 4, 3.

Spark Plug Gaps.—The spark plug gap should be about .025 inch.

Oiling.—Put a very small trace of vaseline on all rubbing parts of the latch, latch lifter, guide and notched shaft every month; also put a drop of light machine oil on the latch pivot and several drops in the oil hole at the side of the shaft and if there is a cup provided under the breaker head, fill with pure vaseline and turn down one or two turns. If the car is driven more than 1000 miles in a month, the oiling must be done every 1000 miles.

Starter.—The starter pinion is meshed with the flywheel gear by moving of the armature. The armature is constructed so that it has considerable end play. A spring at the commutator end normally holds the armature in such a position that the gears are demeshed. When the starting switch is moved so as to connect the first and second contacts a large current is allowed to flow through the motor field and a small current through the armature. This causes a strong attraction between the armature and field with the result that the armature is drawn further into the frame, meshing the gears. The current through the armature causes it to turn slowly, facilitating meshing of the gears. When the engine starts, the current taken by the starter decreases sufficiently to allow the spring to force the armature out, demeshing the gears.

Oiling.—Put 3 or 4 drops of light engine oil in each of the starter oilers every two weeks.

Generator.—Generator current regulation is by reverse series field and a regulating resistance. This regulating resistance is connected in shunt with the reverse series field. When cold, this unit has a very small resistance, but when hot it has a greatly increased resistance. When cold it forms practically a short circuit across the series field terminals, allowing but little current to flow through the series field. As the current through the resistance increases, the temperature and resistance increases, causing more current to flow through the reverse winding, reducing the voltage. As the resistance of the regulating coil increases in proportion to the current through it, the current is held practically constant at speeds above that necessary to produce the maximum charging rate. The charging rate is changed by changing the regulating resistance unit.

Oiling.—Put several drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Lamps.—Head lamps are 6-8 volts, 21 cp. Dash lamp is 6-8 volts, 2 cp. Tail lamp is 6-8 volts, 2 cp.

Fuses.—The main fuse is 30 ampere. The field fuse is 5 ampere.

MODELS D, E, F AND R (1915-16-17) DYNETO GENERATING, STARTING AND LIGHTING SYSTEM CONNECTICUT IGNITION

BATTERY.—Battery is 12 volt, 35 ampere hour. The negative (—) terminal is grounded.

IGNITION.—Breaker contacts separate .018 to .020 inch. When the condition of the contacts affects the ignition, renew the inner breaker mechanism. For temporary service resurface contacts with fine emery cloth.

OILING.—Refill the grease cup under the breaker head with pure vaseline and turn down every month. If the car is driven more than 1000 miles in a month, this must be done every 1000 miles.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order of the 1915-16 four-cylinder cars is 1, 3, 4, 2. The firing order of the 1917 four-cylinder cars is 1, 2, 4, 3. The firing order of the eight cylinder cars is 1R, 4L, 3R, 2L, 4R, 1L, 2R, 3L.

SPARK PLUG GAPS.—Spark plug gaps are .028 to .030 inch.

STARTER-GENERATOR.—Starter and generator are combined into one unit. The unit is permanently chain connected to the engine crankshaft. Starter delivers 1.5 pound-feet torque at 400 R.P.M., and 10 pound-feet lock torque.

GENERATOR.—Generator current regulation is by a reverse series field. Generator begins to supply current at 1100 R.P.M., and reaches the maximum charging rate of 10 amperes at 1700 R.P.M. of the armature or 18 miles per hour.

Generator Data	
Amperes	R.P.M.
2	1100
5	1400
10	1700

OILING.—Put 4 or 5 drops of light engine oil in the starter-generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

LAMPS.—Head lamps are 12-16 volt, 20-24 cp. Dash and tail lamps are 12-16 volt, 2 cp.

Plate No. 190

PAN-AMERICAN 1919

GRAY & DAVIS GENERATING, STARTING AND LIGHTING SYSTEM REMY OR GRAY & DAVIS IGNITION

BATTERY.—Battery is 6 volt, 100 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Breaker contacts separate .020 inch. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Refill the grease cup under the breaker head with soft cup grease and turn down two turns every two weeks. Put a small amount of vaseline on the fiber bumper of the contact arm, applying with a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when the top dead center mark on the fly-wheel is 1 inch past the indicator, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—The spark plug gaps are .025 inch.

STARTER.—Model No. 515. Starter cranks the engine at 100-150 R.P.M. Lock torque is 15 pound-feet at 3.5 volts.

Starter Data

Torque	R.P.M.	Amperes
1 lb. ft.	2100	100
2 lb. ft.	1600	135
4 lb. ft.	1200	195
8 lb. ft.	650	320

OILING.—Put 4 or 5 drops of light engine oil in each of the starter oilers every month.

GENERATOR.—Model No. 619. Generator current regulation is by the third brush system. Maximum charging rate is 15 amperes, reached at 1400 R.P.M. of the armature or 25 miles per hour.

Generator Data

Amperes	R.P.M.
0	460
4	580
8	720
12	940
15	1400
12	2600

Shunt field winding takes 2.6 amperes at 6 volts. Charging rate is varied by adjustment of the third brush setting. Adjustment is made by turning the pinion screw located at the bottom of the rear cover plate, between the fuse and the relay. Turn this screw to the right to increase the charging rate and to the left to decrease the charging rate.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 460-500 R.P.M. of the armature or 8-10 miles per hour, and opens at 420-460 R.P.M. of the armature or 6-8 miles per hour. Relay contacts separate .015 to .018 inch. Air gap between coil core and moving member is .010 to .012 inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 15 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp. All lamps have single contact base.

FUSES.—Fuses are 10 ampere.

Heinze-Springfield Starting and Lighting System

Heinze-Springfield Ignition

Used on First 1500 Cars Only

Battery.—Battery is 6 volt, 80 ampere-hour. The negative (—) terminal is grounded.

Ignition.—Magneto breaker contacts should separate about .020 inch. Should they become badly burned or pitted, affecting the ignition, resurface them with a fine, flat jeweler's file or a strip of worn No. 00 sand paper.

Timing.—Contacts should begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 2, 4, 3.

Spark Plug Gaps.—Spark plug gaps should be .020 inch to .025 inch.

Oiling.—Put 2 or 3 drops of light machine oil in each of the magneto oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Starter.—Starter is connected to the engine through a Bendix drive. Internal circuits are shown on the diagram. On motors having Serial Nos. below 5471, the grounded end of the series field coils are soldered to the pole pieces. On machines above this number the ends are joined to a ground lead which is secured to the bottom of the motor brush head by a hexagonal nut and lock washer.

Oiling.—Put several drops of light engine oil in each of the starter oilers every month. Do not oil the Bendix drive. Should pinion stick, clean shaft with gasoline.

Generator.—Generator current regulation is by a vibrating regulator. Relay is combined with the regulator. Relay should close at about 6 miles per hour. Clean relay and regulator contacts by drawing a piece of worn No. 00 sand paper between them. If badly burned or pitted, resurface them with a piece of worn No. 00 sand paper, drawing a piece of unglazed paper between them, to remove all grit, and adjust, before again putting into service. The maximum generator output should be 10 to 12 amperes.

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Lamps.—Head lamps are 6-8 volts, 20 cp. Dash lamp is 6-8 volts, 2 cp. Tail lamp is 6-8 volts, 4 cp. Trouble lamp is 6-8 volts, 2 cp.

Plate No. 192

Regal

Model J (1917-18)
Auto-Lite Starting and Lighting System
Atwater-Kent Ignition
Used After First 1500 Cars

Battery.—Battery is 6 volt, 80 ampere-hour. The negative (—) terminal is grounded at the starting motor.

Ignition.—Breaker contacts should open not less than .005 inch nor more than .008 inch. The standard setting is .006 inch.

Timing.—Contacts should begin to separate when the top dead center mark on the flywheel is at the indicator, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 2, 4, 3.

The distributor rotor should just clear the high tension distributor points, but not quite touch them. The frame of the breaker is grounded.

Oiling.—Put a very small amount of vaseline on the breaker cam every month. At the same time put several drops of light machine oil in each of the oil cups. If car is driven more than 1000 miles in a month, oiling must be done every 1000 miles.

Care.—Should the tungsten contacts become badly burned or corroded, affecting the ignition, remove them and resurface by drawing across a piece of fine emery cloth laid on a flat surface as on the bed of a drill press, finishing on an oil stone. They will operate properly even though quite irregular.

Spark Plug Gaps.—Spark plug gap should be about .023 inch.

Starter.—The starter is connected to the engine through a Bendix drive. The bearings are packed with soft cup grease which should be renewed once a season.

Generator.—Generator current regulation is by third brush. Relay should close at 8-10 miles per hour.

The maximum charging rate should not exceed 14-16 amperes at 18-20 miles per hour.

Care.—If it is necessary to run the car with the battery disconnected, the generator terminals must be short circuited. Use only the special copper-carbon composition type of brushes supplied, as ordinary carbon brushes will cause trouble.

Oiling.—Put 5 to 8 drops of light engine oil in each of the generator oilers every month. If the car is driven more than 1000 miles in a month, oiling must be done every 1000 miles.

Lamps.—Head lamps are 6-8 volts, 20 cp. Dash lamp is 6-8 volts, 2 cp. Tail lamp is 6-8 volts, 2 cp. Trouble lamp is 6-8 volts, 2-4 cp.

Peerless, Models 54 and 55 (1915), 56 and 57FF (1916), Gray and Davis Generator Atwater Kent Ignition

Plate No. 193

PEERLESS MODELS 54 AND 55 (1915)

Gray and Davis Starting and Lighting System
Atwater-Kent Ignition

Battery.—A 6 volt, 85 ampere-hour capacity battery is used on the 1915 cars. On the 1916 cars a 6 volt, 115 ampere-hour capacity battery is used. The positive (+) terminal is grounded at the starting motor.

The Models 56 and 57FF are the same as the 54 and 55 except for the starter switch and starter transmission. On the Models 56 and 57FF cars, the switch is under the floor boards. Its only function is to open and close the starting circuit. On these models the dash fuse is connected to the negative (—) terminal of the starter switch and the positive (+) terminal of the battery is grounded to the car frame instead of being led to the motor first.

Ignition.—Breaker contacts should open .010 inch to .012 inch. They are made of tungsten metal. If it is desired to adjust or work on the breaker or distributor, the unit may be removed as directed on Plate No. 15 and taken to a convenient place to work.

Timing.—Spark should occur when the piston entering power stroke is on top dead center, spark control lever on the steering gear midway between the fully retarded and the fully advanced position.

Firing Order.—On the 1915 type 5K cars, the firing order is 1, 4, 2, 6, 3, 5. Since that time, the firing order of all six cylinder cars is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—The spark plug gap is .030 inch to .034 inch.

Oiling.—Clean thoroughly and put a small amount of light machine oil on the wearing parts of the breaker, every month. This oil must reach the lifter guide, the latch pivot and the notched shaft, but the contact points must be kept free from oil and all foreign matter. If the machine is driven more than 1000 miles per month the oiling must be done every 1000 miles. Do not test the circuit across the contacts with a screw driver or other conducting material as the resulting current flow will injure the parts.

Starter.—The starter is connected to the engine by a set of reduction gears and sliding pinion which meshes with the flywheel gear. When the starting pedal is depressed, the pinion is moved along the keyed shaft. If it is in the proper position to mesh with the flywheel gear when it reaches it, they are meshed immediately. If not, the spring is compressed, which forces the pinion into mesh as soon as the starter switch is closed and the armature begins to turn. There is an overrunning clutch to prevent the engine driving the starter.

Oiling.—Every two weeks put 8-10 drops of light engine oil in each of the motor oilers. If the machine is driven more than 500 miles in two weeks, the oiling must be done every 500 miles. The gears and sliding surfaces must be kept well oiled. The starter gear case should receive at least one tablespoonful of heavy engine oil every month.

Generator.—Generator voltage regulation is by a vibrating regulator, combined with the relay and mounted on the generator case. When relay or regulator contacts become dirty, they should be cleaned by drawing a piece of soft paper between them.

Care.—If they are corroded or burned, due to operating when oily or under other adverse conditions, they should be resurfaced with a very fine, flat jeweler's file or a worn piece of No. 00 sand paper.

Output.—The maximum output of the generator is reached at 10-12 miles per hour.

Charging Rate.—The charging rate will vary with the state of charge of the battery. When the battery is nearly discharged, the charging current may reach as high as 14-16 amperes. This rate will gradually reduce to 4 or 5 amperes when the battery is nearly charged. When the lights are turned on, the frequency at which the regulator operates is reduced, thus increasing the output of the generator and holding the charging rate practically constant at a given speed, whether lights are "On" or "Off." The generator terminals are marked "B" and "L," (marked "11" and "12" on diagram.) Both of these terminals are negative. The frame serves as a positive terminal. The center terminal is grounded. It is the end of the shunt winding of the relay-regulator. Terminal "B" is the end of the series winding and is connected to the battery through the ammeter and fuse. Terminal "L" is the tap taken off the series winding at a point near the end. This terminal is to be connected to the lighting switch, and supplies the lighting circuits.

Oiling.—Once every two weeks put 8-10 drops of light engine oil in each of the generator oilers. If the machine is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Lamps.—Head lamps are 6-8 volts, 17 cp. Side or dimmer lamps are 6-8 volts, 5 cp. Dash and tail lights are each 6-8 volts, 2 cp.

Fuse.—The main fuse on the dash is of 30 amperes capacity. All other fuses are of 10 amperes capacity.

OVERLAND

MODELS 80, 81 AND 82 (1915) AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM SPLITDORF MAGNETO IGNITION

Plate No. 194

BATTERY.—Battery is 6 volt, 100 ampere-hour. The negative (—) terminal is grounded at the starting motor.

IGNITION.—Dixie Magneto. Breaker contacts separate .020 inch. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Fill the magneto oil cups with light engine oil every month. Apply one drop of oil to the breaker bar bearing. If the car is driven more than 1000 miles in a month, the oiling must be done every 1000 miles.

TIMING.—Breaker contacts begin to separate when the top dead center mark "U. P. 1 & 4" or "U. P. 1 & 6" is 1 1/4 inches past the indicator, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order of Models 80 and 81 is 1, 3, 4, 2. The firing order of Model 82 is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .020 inch.

STARTER.—Model MC or MD. Starter is connected to the engine through a pinion shifted 80 and 81 there is a device mounted on top of the gear housing, to prevent the gears being accidentally meshed when the engine is running, or the starter being used when being accidentally meshed when the engine is running, or the starter being used when the lighting switch is locked. This device is shown on next page. When the "Start" button in the lighting switch is pressed, the current flowing through the solenoid produces an electro-magnet, which draws up the iron plunger permitting the depressing of the starting switch on the floor of the car, which in turn meshes the pinion with the fly-wheel gear and closes the switch contacts. When the "Start" button in the lighting switch is released, the iron plunger is allowed to drop down, locking the main starting switch in the off position. The brown wire coming out of the switch leads to the solenoid. A ground in this wire will cause the solenoid to fail to release the switch. On Model 82 cars, equipped with the Bendix drive, there is a similar device to lock the starting switch "Off." It operates the same as the one described above. The switch will not operate if the "Start" button is not pressed.

OILING.—The rear motor bearing is packed with grease. This grease should be renewed every season. Use soft cup grease in the cup at the gear end. Tighten this cup a turn every week. Do not lubricate the Bendix drive. Keep spiral clean with gasoline. The manually operated, sliding gear, and the flywheel gear on this type, should be cleaned with kerosene and lubricated with a mixture of graphite and oil every month.

GENERATOR.—Model GC or GA. Generator current regulation is by reverse series field.

Generator Data

Model GA (6 Cylinder Cars)		Model GC (4 Cylinder Cars)	
Amperes	R.P.M.	Amperes	R.P.M.
5	550-650	5	800-1000
10	980-1120	10	1350-1575
12.5	1365-1520	12.5	1700-2050
15	1850-2400	15	2250-3300
17-19	3000-3750	15-18	3300-3700

Current output may be varied slightly by adjustment of the brush tension. Brush tension should be 1 to 1 1/4 pounds. Generator Model GA takes 2 amperes when operating freely as a motor, armature revolving at 200 R.P.M. Model GC takes 2.25 amperes, armature revolving at 450 R.P.M. Shunt field winding of Model GA takes 1.4 amperes. Shunt field winding of Model GC takes .8 ampere.

OILING.—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles. Thoroughly clean out and repack the bearings with soft cup grease every six months.

RELAY.—On Models 80 and 81 the relay closes at 575-650 R.P.M. of the armature or 8-10 miles per hour, and opens at 525-575 R.P.M. of the armature or 6-8 miles per hour. On Model 82, the relay closes at 310-380 R.P.M. of the armature or 8-10 miles per hour and opens at 250-310 R.P.M. of the armature or 6-8 miles per hour. Charging current is .5 to 1.5 amperes at closing and the discharge current 0-1 ampere at opening of relay contacts. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 15 cp. Dash and tail lamps are connected in series and are each 3-4 volt, 2 cp. Other lamps are 6-8 volt, 4 cp.

Auto-Lite Starting and Lighting System

Connecticut Ignition

Overland, Model 85-4 (1917), Auto-Lite Starter and Generator, Connecticut Ignition

Plate No. 196

Battery.—Battery is 6 volt, 80 ampere-hour. The negative (—) terminal is grounded to the starting motor.

Ignition.—Breaker contacts should separate .016 inch to .018 inch. They are made of tungsten. They will operate properly even though quite rough. Should they become badly worn, affecting the ignition, the inner breaker mechanism should be renewed as directed on Page 50. In an emergency, contacts may be resurfaced enough to give service for 300 or 400 miles by drawing a piece of fine emery cloth between them.

Timing.—Contacts should begin to separate when the mark "1-4 U.P." on the flywheel is 1-1/4 to 1-7/16 inches past the indicator, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plug Gaps.—Spark plug gaps should be about .023 inch.

Ignition Cutout.—There is a thermostat in the combination switch to prevent discharging of battery through ignition should the switch be left "On" with engine idle and contacts closed. This device is fully described on Page 41.

Oiling.—Refill the cup under the breaker head with pure vaseline and turn down every month. If car is driven more than 1000 miles in a month, this must be done every 1000 miles. Do not put grease or oil in the cup.

Starter.—Starter is connected to engine through a Bendix drive. When running free, armature should revolve at about 4200 R. P. M., taking 50-55 amperes. Greater speed indicates grounded, short circuited or damp field windings. Greater current or vibrating of the ammeter needle indicates grounded or short circuited armature coils or commutator. Damp armature windings will cause high current or slow speed.

STARTER DATA, MODEL MC

Torque	R. P. M.	Amperes
1 lb. ft.	2650	100
2 lb. ft.	1900	145-150
3 lb. ft.	1000	185-190
4 lb. ft.	1400	225
5 lb. ft.	1250	250-255
6 lb. ft.	1000	290-300

Starter should develop 16 pound-feet lock torque, taking 450-460 amperes at 3.8 to 4.2 volts.

Oiling.—Clean and repack starter bearings with soft cup grease every six months. Put in one or two drops of oil every month to keep grease soft.

Generator.—Generator current regulation is by reverse series field. Relay should close at 8-10 miles per hour or 575-650 R. P. M., of generator armature. Charging current should be .6 to 1.5 amperes at closing and discharge current 0-1 at opening.

Amperes	GENERATOR DATA, MODEL GD	R. P. M.
5.0		800-1000
10.0		1350-1575
12.5		1700-2050
15.0		2250-3300
15-18		3300-3700

A variation of 1.5 amperes from these amounts is allowable. Generator output may be varied slightly by adjusting the brush pressure on commutator. The pressure should be 1-1/4 pounds. Shunt field should take about .8 ampere. If operated freely as a motor, armature should revolve at 450 R. P. M., taking 1.75 amperes. Much higher speed indicates damp, grounded or short circuited field coils. Greater current or lower speed indicates tight bearings, or damp, grounded or short circuited armature windings or commutator. Periodic swinging of ammeter needle indicates grounded or short circuited armature coils or commutator bars.

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Lamps.—Head lamps are 6-7 volts, 16 cp. Dash and tail lamps are in series. They are each 3-3 1/2 volts, 2 cp.

Fuses.—Fuses are 20 ampere.

Model Numbers.—Generator is Model GD. Starter is Model MC. On early models battery is Willard OHSLB or Prestolite 613 WO2. On the later models U. S. L. type AD-313 battery is used.

Overland

Model 85-6 (1917)

Auto-Lite Starting and Lighting System. Connecticut Ignition

Battery.—Battery is 6 volt, 80 ampere-hour. The negative (—) terminal is grounded at the starting motor.

Ignition.—Breaker contacts should separate .018 inch to .020 inch. They are made of tungsten. They will operate properly even though quite rough. Should they become badly worn, affecting the ignition, the inner breaker mechanism should be renewed as directed on Page 50. In an emergency, contacts may be resurfaced enough to give service for 300 or 400 miles by drawing a piece of fine emery cloth between them.

Timing.—Contacts should begin to separate when the mark "1-6 D-C" on the flywheel is $1\frac{1}{8}$ inches past the indicator, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—Spark plug gaps should be about .023 inch.

Ignition Thermostat.—There is a thermostat in the lighting-ignition switch case to open the ignition circuit, should the switch be left "On" with engine idle, contacts closed. This device is treated on Page 50.

Oiling.—Refill the cup under the breaker head with pure vaseline and turn down every month. If car is driven more than 1000 miles in a month, this must be done every 1000 miles. Do not put grease or oil in the cup.

Starter.—Starter is connected to engine by a Bendix drive. Cold engine, tight bearings, heavy oil or other obstructions will cause slow cranking speed and high current.

Oiling.—Clean and repack starter bearings with soft cup grease every six months. Put in one or two drops of oil every month to keep grease soft.

Generator.—Generator current regulation is by reverse series field in the type GG generator and by third brush system in the GH type generator. Relay should close at 500-575 R. P. M., of generator armature on the GG generator and at 550-600 R. P. M. on GH type generator. Charging current should be .5 to 1.5 ampere at closing and the discharge current 0 to 1 at opening.

GENERATOR DATA.

Model GG (Reverse Series Type).		Model GH (Third Brush Type).	
Amperes	R. P. M.	Amperes.	R. P. M.
5.0	750-860	5.0	760-820
10.0	1225-1400	10.0	1020-1100
12.5	1600-1825	12.5	1200-1300
15.0	2175-2450	15.0	1460-1675
17-18	3200-3700	15-17	1950-2250

A variation of 1.5 amperes from these amounts is allowable. Output may be varied somewhat by adjusting brush pressure on commutator on GG type or third brush on GH type. The pressure should be 1 to $1\frac{1}{4}$ pounds. If operated freely as a motor, type GG generator should take 2.8 amperes, armature revolving at 350 R. P. M. Model GH generator should take 2.7 amperes, armature turning at 450 R. P. M. Greater speed indicates damp, grounded or short circuited field coils. Greater current or lower speed indicates tight bearings or damp, grounded or short circuited armature windings or commutator. Periodic swinging of ammeter needle indicates grounded or short circuited armature coils or commutator bars. Shunt field should take approximately 1.1 amperes on model GG and 1.7 amperes on model GH.

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Lamps.—Head lamps are 6-7 volts, 16 cp. Dash and tail lamps are in series. They are each 3-3.5 volts, 2 cp.

Fuses.—Fuses are 20 ampere.

Model Numbers.—Generator Model GG 1064 is used on cars having Serial Number up to 13,000. On cars above this number, type GH 1006 generator is used. Starter is Model ME 1021 on cars up to Serial Number 1179. After this number type ME 1026 is used. A USL AD 313 battery is used on late cars. On early cars battery is Wilhard OHSLB or Prestolite 613 W 02.

Overland, Model 85-6 (1917), Auto-Lite Starter and Generator, Connecticut Ignition

Plate No. 197

Overland, Model 90 (1918), Auto-Lite Starter, Connecticut Ignition
Plate No. 198

Overland

Model 90 (1918) Auto-Lite Starting and Lighting System Connecticut Ignition

Battery.—Battery is 6 volt, 80 ampere-hour. The negative (—) terminal is grounded at the starting motor.

Ignition.—Breaker contacts should separate .016 inch to .018 inch. They are made of tungsten. They will operate properly even though quite rough. Should they become badly worn, affecting the ignition, the inner breaker mechanism should be renewed as directed on Page 50. In an emergency, contacts may be resurfaced enough to give service for 300 or 400 miles by drawing a piece of fine emery cloth between them.

Timing.—Contacts should begin to separate when the top dead center mark "1-4 U-P" on the flywheel is $1\frac{1}{4}$ inch past the indicator, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plug Gaps.—Spark plug gaps should be about .023 inch.

Ignition Thermostat.—There is a thermostat or automatic overload release in the ignition switch. If the ignition switch is left on, with the engine idle, the thermostat will open the circuit after a short time. Cars having serial number below 107,706 are equipped with the device described on Page 41. Cars above this number have the new type switch. In this device, the current flowing through the heavy winding heats the blade sufficiently to cause it to bend, separating the contacts. This causes the current to flow through the other, fine coil, heating it. This causes the blade to bend away, releasing the latch which holds the ignition switch "On". The device should operate within 3 minutes after engine is stopped, contacts closed. With proper adjustment it will act in 10-15 seconds.

Starter.—Starter is connected to the engine through a Bendix drive. Cold engine, heavy oil, tight bearings or other obstructions or damp, grounded or short circuited motor windings or commutator bars will cause low speed and excessive current during the cranking operation.

Oiling.—Clean and repack starter bearings with soft cup grease every six months. Put in one or two drops of oil every month to keep grease soft.

Generator.—Generator current regulation is by third brush system. Relay contacts should close at 550-600 R. P. M., of generator armature. Charging current should be .5 to 1.5 amperes at closing and 0 to 1 ampere at opening of relay contacts.

GENERATOR DATA, MODEL GH

Amperes	R. P. M.
5	760-820
10	1020-1100
12.5	1200-1300
15	1460-1675
15-17	1950-2250

If operated freely as a motor, generator should take 2.7 amperes, armature revolving at 450 R. P. M. Much higher speed indicates damp, grounded or short circuited field coils. Greater current or lower speed indicates tight bearings or damp, grounded or short circuited armature windings or commutator. Periodic swinging of the ammeter needle indicates grounded or short circuited armature coils or commutator bars. Shunt field should take about 1.7 amperes.

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Lamps.—Head lamps are 6-7 volts, 16 cp. Dash and tail lamps are in series. They are each 3-3.5 volts, 2 cp.

Fuses.—Fuse is 20 ampere.

Model Numbers.—Generator is Model GH 1006. Starter is Model MF 1086. Battery is USL CD 311. On some of the early cars, Gould B 7675 or Willard OLBA battery was used.

Plate No. 199

Jeffery

Models 462 and 661 (1916)

Bijur Starting and Lighting System

Bosch Magneto Ignition

Battery.—Battery is 6 volt, 80 ampere-hour. The positive (+) terminal is grounded at the starting switch.

Ignition.—Breaker contacts should open .014 inch to .016 inch. Clean contacts with gasoline frequently. If they are burned or pitted, resurface them with a fine flat jeweler's file or a strip of worn No. 00 sand paper.

Timing.—Contacts should begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order of Model 462 is 1, 3, 4, 2. The firing order of Model 661 is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—Spark plug gaps should be .018 inch to .020 inch.

Oiling.—Put 3 or 4 drops of light machine oil in each of the magneto oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Starter.—Starter is connected to the engine by a pinion shifted by the operator. When the starting pedal is depressed part way, the motor is connected to the battery, in series with a resistance. This action causes it to rotate slowly to facilitate meshing of the gears. Further depressing the switch opens the circuit and meshes the pinion with the flywheel gear finally connecting the motor winding direct to the battery, causing it to operate at full power, cranking the engine.

Oiling.—Put several drops of light engine oil in each of the motor oilers every two weeks.

Generator.—Generator current regulation is by third brush system. Relay is in the generator frame. Relay should close at about 10 and open at about 8 miles per hour.

Fuse.—There is a 10 ampere fuse in the small aluminum cap mounted on the generator head. This fuse is in the shunt field circuit. It will burn out, rendering generator inoperative, if generator is run with excessive resistance in the charging circuit. Remove this fuse if it is necessary to operate generator with battery disconnected.

Output.—The normal generator output should be about 14 amperes at 20-25 miles per hour car speed or about 1400 R. P. M., of generator, specific gravity of the battery reading 1.250 or above.

Oiling.—Put 4 or 5 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Lamps.—Head lamps are 7.5 volts, 18 cp. Dimmer lamps are 7.5 volts, 4 cp. Tail lamp is 7.5-8 volts, 3 cp. Dash lamp is 7.5-8 volts, 3 cp.

Fuses.—Lighting fuses are 20 ampere.

Plate No. 200

Briscoe

Model 8-38 (1916)

Splitdorf-Apelco Starting and Lighting System

Remy Ignition

Battery.—Battery is 12 volt, 35 ampere-hour. The negative (—) terminal of one-half of the battery is grounded at the switch.

Ignition.—Breaker contacts should open .020 inch to .025 inch. They are made of tungsten so should not be filed or sand papered.

Care.—Should they become badly burned or pitted, resurface them by drawing across a piece of fine emery cloth laid on a very flat surface, as on the bed of a drill press.

Timing.—Contacts should begin to separate when piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1R, 1L, 3R, 3L, 4R, 4L, 2R, 2L.

Spark Plug Gaps.—The spark plug gap should be .027 inch to .030 inch.

Oiling.—The oiler under the breaker should be kept full of medium cup grease and tightened two turns every 500 miles. In case the oiler is provided with a wick, use pure vaseline instead of cup grease.

Starter.—The motor-generator circuits are fully traced on Page No. 161. Directions for the care of the system are also given on this page.

Output.—The maximum generator output should be 7-8 amperes, reached at 20 miles per hour, high gear car speed. Relay should close at about 8 miles per hour.

Fuse.—There is a 10 ampere, strip fuse, on the back of the relay. This fuse is in the lighting circuit. Put 5 or 6 drops of light engine oil in each of the generator oilers every month or 1000 miles.

Lamps.—Head lamps are 6-8 volts, 17 cp. Tail lamp is 6-8 volts, 2 cp.

Plate No. 201

Briscoe

Model 4-24 (1917-18)

Splitdorf-Apelco Starting and Lighting System Connecticut Ignition

Battery.—Battery is 6 volt, 85 ampere-hour. The positive (+) terminal is grounded.

Ignition.—Contacts should open .014 inch to .015 inch. Breaker contacts are made of tungsten metal.

Care.—Should they become so badly worn as to impair the proper operation of the engine, the inner breaker mechanism should be renewed as directed on Page No. 50.

Spark Plug Gaps.—The spark plug gap is .028 to .031 inch, about the thickness of a smooth dime.

Timing.—Spark should occur when the top dead center mark on the flywheel is just past the indicator, spark control lever and breaker assembly in the fully retarded position. A simple test for the breaker setting is as follows: With spark control lever fully retarded, turn engine until the mark "1 and 4" on the flywheel is at the indicator. Ammeter should indicate discharge, all lights off. Advancing the spark control lever $\frac{1}{2}$ inch should cause the ammeter to indicate zero, due to the opening of the breaker contacts.

Firing Order.—The firing order is 1, 3, 4, 2.

Care.—Use only pure vaseline in the cup under the breaker head. Ignition should take about 5 amperes, engine idle and contacts closed, and about 3 amperes when engine is running.

Starter.—The starter is connected to the engine by a Bendix drive. Every month put several drops of light engine oil in each of the motor oilers.

Generator.—Generator voltage regulation is by a vibrating regulator. Relay should close at about 8 and open at 6-7 miles per hour. The maximum generator output should be 12-14 amperes, reached at about 20 miles per hour.

Care.—The output is decreased by decreasing the spring tension on the vibrator and increased by increasing the spring tension. Internal circuits of and directions for the care of the generator are given on Page 160.

Lamps.—Head lamps are 6-8 volts, 17 cp., on the 1917 cars and 6-8 volts, 20 cp., on the 1918 cars. Dash lamp is 6-8 volts, 2 cp. Tail lamp is 6-8 volts, 2 cp. Tonneau, dome and trouble lamps are 6-8 volts, 2 cp.

Fuses.—Lighting fuses are 10 ampere.

Stevens-Duryea, Model D-6 (1915), Delco Starter-Generator, Eisemann Ignition

Plate No. 202

Stevens-Duryea

Model D-6 (1915)

Delco Starting and Lighting System

Eisemann Magneto Ignition

Battery.—Battery is 6 volt, 150 ampere-hour. The positive (+) terminal is grounded.

Ignition.—Magneto breaker contacts should open .015 inch to .018 inch.

Care.—Keep clean, by using gasoline. If badly burned or pitted, resurface them with a fine, flat jeweler's file or a small strip of worn No. 00 sand paper.

Timing.—Magneto should be set so that the contacts will begin to separate when the top dead center mark on the flywheel is $1\frac{1}{2}$ inches past the indicator, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 4, 2, 6, 3, 5.

Spark Plug Gaps.—The spark plug gap should be .028 inch to .031 inch.

Starter.—Motor-generator No. 35 consists of motor and generator combined into one frame, but electrically separate. There are two separate armature and two separate field windings. When the "Start" button is pressed, a current flow of 4.5 amperes causes the generator to run slowly as a motor, facilitating the meshing of the starting gears. Depressing the starting pedal draws the gears into mesh and allows the motor brush to come in contact with the commutator, applying full battery pressure to motor and cranking engine.

Relay should close at 8-10 miles per hour. The generator should reach the neutral point, that is the point at which it neither receives current from or delivers current to the battery, when being driven at about 400 R. P. M. It should deliver 5 amperes at 500, 12 amperes at 1000, and 16-20 amperes at 1500 R. P. M.

Generator.—Generator voltage regulation is by a mercury regulator. This device is fully described on Page Nos. 65 and 65A.

Lamps.—Head lamps are 6-8 volts, 15 cp. Side lamps are 6-8 volts, 4-6 cp. Dash lamp is 6-8 volts, 2 cp. Tail lamp is 6-8 volts, 2 cp. Tonneau and pillar lamps are 6-8 2 cp.

Circuit Breaker.—There is a circuit breaker to take the place of fuses in the light circuits.

Plate No. 203

Willys-Knight

Model 84 (1916)

Auto-Lite Starting and Lighting System. Dixie Magneto Ignition.

Battery.—Battery is 6 volt, 115 ampere-hour. The positive (+) terminal is grounded at the starting motor.

Ignition.—Instructions for the care of the magneto are given on Page No. 189.

Timing.—Contacts should open .020 inch. Magneto should be timed so that when the mark $\frac{1+4}{T.C.}$ on the flywheel is $2\frac{1}{4}$ inches past the indicator, spark control lever and breaker assembly in the fully retarded position, breaker contacts will be just beginning to separate.

Care.—Should they become badly burned or pitted, resurface them with a very fine flat jeweler's file, or a small strip of worn No. 00 sand paper.

Spark Plug Gaps.—Spark plug gap should be .020 inch.

Firing Order.—The firing order is 1, 3, 4, 2.

Oiling.—Put 3 or 4 drops of light machine oil in each of the magneto oilers once every two weeks or 500 miles. Put one or two drops of oil on the contact lever pivot at the same time. Apply this oil with a toothpick so as not to get on too much.

Starter.—The starter is connected to the engine through a Bendix drive. Motor bearings are packed with a soft cup grease. The bearings should be cleaned and repacked with grease once every season. Should the pinion jam and remain meshed with the flywheel gear, close starting switch for an instant and then turn engine quickly by hand crank. This method will nearly always loosen pinion after several trials. Use only the special copper-carbon composition brushes furnished by the manufacturers. Ordinary carbon brushes will cause trouble.

Generator.—Generator voltage regulation is by reverse series winding. Relay should close at $7\frac{1}{2}$ miles per hour.

Output.—The maximum generator output should be about 14 amperes reached at 20 miles per hour. The output should be about 10 amperes at 15 miles per hour.

Oiling.—Generator bearings are packed with soft cup grease. The bearings should be thoroughly cleaned and repacked with grease at least once a season. Every two weeks or 1000 miles put a drop of oil in each of the bearings to keep the grease soft. Use only the special copper-carbon composition brushes furnished by the manufacturer. Ordinary carbon brushes will cause trouble. Spring should have just enough tension on brushes to ensure a good contact with the commutator. Generator terminals must be connected if generator is to be operated with battery disconnected.

Lamps.—Head lamps are 6-8 volts, 15 cp. Side lamps are 6-8 volts, 4 cp. Dash and tail lamps are in series. They are each 3-4 volts, 2 cp. All other lamps are 6-8 volts, 4 cp.

Fuses.—Fuses are of 20 amperes capacity.

Willys-Knight, Model 88-4 (1916-17), Auto-Lite Starter and Generator
Connecticut Ignition

Plate No. 204

Willys-Knight

Model 88-4 (1916-17)

Auto-Lite Starting and Lighting System Connecticut Ignition

Battery.—Battery is 6 volt, 120 ampere-hour. The negative (—) terminal is grounded at the starting motor.

Ignition.—Breaker contacts should separate .016 inch to .018 inch. They are made of tungsten. They will operate properly even though quite rough. Should they become badly worn, affecting the ignition, the inner breaker mechanism must be renewed as directed on Page 50. In an emergency, contacts may be resurfaced enough to give service for 300 or 400 miles by drawing a piece of fine emery cloth between them.

Timing.—Contacts should begin to separate when the mark "1-4 U-P" on the flywheel is $2\frac{1}{2}$ inches past the indicator, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plug Gaps.—Spark plug gaps should be about .023 inch.

Ignition Thermostat.—There is a thermostat in the switch case to open the ignition, preventing battery discharging through the ignition apparatus should ignition switch be left "On" with engine idle, contacts closed. This device is fully described on Page 41.

Oiling.—Refill the cup under the breaker head with pure vaseline and turn down every month. If car is driven more than 1000 miles in a month, this must be done every 1000 miles. Do not put grease or oil in the cup.

Starter.—Starter is connected to the engine through a Bendix drive. Cold engine, tight bearings, heavy oil or other obstructions will cause a high current flow and low speed during cranking operation. When running free, armature should revolve at about 4200 R. P. M., taking 50-55 amperes. Greater speed indicates grounded, short circuited or damp field windings. Greater current or vibrating of the ammeter needle indicates grounded or short circuited armature coils or commutator. Damp armature windings will cause high current or slow speed.

Oiling.—Clean and repack starter bearings with soft cup grease every six months. Put in one or two drops of oil every month to keep grease soft. Do not oil the Bendix drive. Should pinion stick, clean shaft with gasoline.

Generator.—Generator current regulation is by reverse series field. Relay should close at 7-10 M. P. H., or 230-265 R. P. M., of generator armature. Charging current should be .5 to 1.5 amperes at closing and discharge current 0 to 1 at opening.

Amperes	GENERATOR DATA, MODEL GF	R. P. M.
5		430- 490
10		730- 870
12.5		945-1180
15		1225-1660
16-19		2200-2800

A variation of 1.5 amperes from these amounts is allowable. Output may be varied slightly by adjusting brush pressure on commutator. The pressure should be 1 to $1\frac{1}{4}$ pounds. If operated freely as a motor, armature should revolve at 200 R. P. M., taking 1.8 amperes. Much higher speed indicates damp, grounded or short circuited field coils. Greater current or lower speed indicates tight bearings or damp, grounded or short circuited armature windings or commutator. Periodic swinging of ammeter needle indicates grounded or short circuited armature coils or commutator bars. Shunt field should take about 1 ampere.

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Lamps.—Head lamps are 6-7 volts, 16 cp. Dimmer lamps are 6-7 volts, 4 cp. Dash and tail lamps are in series. They are each 3-4 volts, 2 cp.

Fuses.—Fuses are 20 ampere.

Model Numbers.—Generator is Model GF 1176. Starter is Model MC 1019 on the first 2400 cars and MC 1126 on later cars. On early cars a Willard OLBA battery was used. On later cars a USL CD 315 D battery is used.

Model 88-8 (1916-17-18)

Auto-Lite Starting and Lighting System. Remy Ignition

Battery.—Battery is 6 volt, 120 ampere-hour. The negative (—) terminal is grounded at the starting motor.

Ignition.—Breaker contacts should separate .020 inch to .025 inch.

Should they become badly burned or pitted, resurface with a fine, flat jeweler's file or a piece of worn No. 00 sand paper.

Timing.—Contacts should begin to separate when the mark "1-4 T-C R" on the flywheel is $1\frac{1}{2}$ inches past the indicator, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1R, 1L, 3R, 3L, 4R, 4L, 2R, 2L.

Spark Plug Gaps.—Spark plug gaps should be .027 inch to .030 inch.

Oiling.—Refill the cup under the distributor head with soft cup grease and turn down two turns every two weeks. At the same time put a small amount of vaseline on the fiber bumper of the contact arm, using a toothpick. If the car is driven more than 500 miles in two weeks, these attentions should be given every 500 miles.

Starter.—Starter is connected to the engine through a Bendix drive. When running free, armature should revolve at about 4200 R. P. M., taking 50-55 amperes. Greater speed indicates grounded, short circuited or damp field windings. Greater current or vibrating of the ammeter needle indicates grounded or short circuited armature coils or commutator, Damp armature windings will cause high current or slow speed.

STARTER DATA, MODEL MC

Torque	R. P. M.	Amperes
1 lb. ft.	2650	100
2 lb. ft.	1900	145-150
3 lb. ft.	1600	185-190
4 lb. ft.	1400	225-230
5 lb. ft.	1250	250-255
6 lb. ft.	1000	290-300

Starter should develop 16 pound-feet lock torque, taking 450-460 amperes at 3.8-4.2 volts.

Oiling.—Clean and repack starter bearings with soft cup grease every six months. Put in one or two drops of oil every month to keep grease soft.

Generator.—Generator current regulation is by reverse series field (GG) on early cars and by third brush system on later models (GH). Relay should close at 8-10 miles per hour or 500-575 R. P. M. of armature on Model GG generator and at 550-600 R. P. M., on Model GH. Charging current should be .6 to 1.5 amperes at closing and discharge current 0 to 1 at opening.

GENERATOR DATA

Model GG		Model GH (Three Brush Type).	
Amperes	R. P. M.	Amperes	R. P. M.
5.0	750-860	5.0	760-820
10	1225-1400	10	1020-1100
12.5	1600-1825	12.5	1200-1300
15	2175-2450	15	1460-1675
17-19	3200-3700	15-17	1950-2250

A variation of 1.5 amperes from these amounts is allowable. Generator output may be varied slightly by adjusting third brush on Model GH or brush pressure on Model GG. The pressure should be 1 to $1\frac{1}{4}$ pounds. When operating freely as a motor, GG generator should take 2.8 amperes, armature turning at 350 R. P. M. Model GH should take 2.7 amperes, armature turning at 450 R.P.M. Much higher speed indicates damp, grounded or short circuited field coils. Greater current or lower speed indicates tight bearings or damp, grounded or short circuited armature windings or commutator. Periodic swinging of ammeter needle indicates grounded or short circuited armature coils or commutator bars. Shunt field should take 1.1 amperes on Model GG and 1.7 amperes on Model GH.

Oiling.—Put 5 or 6 drops of light engine oil in each of generator oilers every two weeks. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.

Lamps.—Head lamps are 6-7 volts, 16 cp. Dimmer lamps are 6-7 volts, 4 cp. Dash and tail lamps are in series. They are each 3-3½ volts, 2 cp.

Fuses.—Fuses are 20 ampere.

Model Numbers.—Starter is Model MC 1126. Generator is Model GG 1046 on cars before Serial No. 3000. After this number, generator is Model GH. Battery is USL CD 315 D. Some of the early cars were equipped with a Willard OLBA type battery.

PACKARD
 Models 1-38 and 3-38 (1914)
 Delco Starting and Lighting System
 Plate No. 206

Packard

Models 1-38, 3-48 (1914)

Delco Starting and Lighting System

Bosch Dual Ignition

Battery.—Battery is 6 volt, 100 ampere-hour. The two-wire system is used. There is a separate 6 volt, 40 ampere hour battery to supply ignition current.

Ignition.—Magneto breaker contacts should open .014 inch to .015 inch. Battery breaker contacts should open .020 inch. Complete directions for the care of and connections of the magneto are given on Page 182. If it is desired to run the car with the coil out, remove wires from magneto terminals 1, 2, 3 and 4 (Page 182). Then connect terminals 3 and 4 with a short piece of high tension cable.

Timing.—Spark should occur when the piston entering power stroke is on top dead center spark control lever within one inch of the fully retarded position. The marks "O" on the magneto couplings should both line up when putting magneto in place. The leather washer which fits between the couplings has holes slightly off center to facilitate alignment. The magneto chain gears should line up with the "O" marks on the chain links when the "O" on the upper gear is on top and the "O" on the lower gear is on the bottom. These marks so line up every 40 revolutions. Care should be taken when removing or replacing either the magneto driving shaft flange or magneto, not to move the magneto shaft or gear shaft, as one complete turn will throw out magneto timing, although the marks and holes line up. These marks should be lined up when the exhaust valve of No. 1 cylinder, is open.

Firing Order.—The firing order is 1, 4, 2, 6, 3, 5.

Spark Plug Gap.—Spark plug gap should be .020 inch to .023 inch.

Motor-Generator.—The motor and generator are combined into one unit, although they are electrically separate, there being two separate armature windings, two commutators and two separate field windings.

Starter.—In the following explanation, all numbers and letters refer to Plate 295. When the "Starting Button" (21) is pressed, the current flows from battery positive (+) through knife switch (2 and 12 now connected) and through ammeter (which should indicate 10 amperes but immediately drop back to 3-5 amperes, discharge) into the generator at 14, through armature, (causing it to rotate at about 100 R. P. M., to facilitate meshing of the gears) out at 15, being divided at 16, a portion flowing through the shunt winding (6 and 7) to the voltage regulator at 39. The remainder of the current flows along wire 17 to 18, through the magnetic latch coil to the button (21) and back to the battery negative (—) terminal (11). The current through the magnetic latch coil (20) lifts the latch, making mechanical connection between the starter pedal and the gear train. Depressing the starting pedal meshes the gears and then trips the knife switch, opening generator circuit and connecting contacts 2 and 3 which completes the motor circuit cranking the engine.

Generator.—As the engine speeds up, the armature is driven as a generator. The current generated flows from 14, through the ammeter, through 12 and 2 to connection 36. No current can pass to the battery through 34 until the relay contacts (24) are closed. Current flows through the shunt coil (35), past 25 to the generator at 15. When the generator pressure reaches about 7 volts, the current through the shunt coil (35) produces strong enough magnetism to close the contacts. The current then follows the same circuit as last described up to the point marked "36." While a small part of it still follows the above path, the greater part, (the charging current) flows through the battery, the series relay coil (34) and back to the generator at 15.

Delco Starting and Lighting System
Bosch Dual Ignition

(Continued from Preceding Page.)

Packard, Models 1-38 and 3-48 (1914), Starting and Charging Circuits

Plate No. 207

Voltage Regulator.—The generator is shunt wound, in which type of a machine the voltage, hence the output in amperes increases rapidly as the speed increases, unless controlled by some means. The voltage regulator cuts more and more resistance into the shunt field circuit as the speed increases, thus reducing the current through this circuit, which keeps the voltage within the desired limits. The voltage regulator consists of a non-magnetic metal tube (G), an insulating bushing (A) forming two concentric chambers, not electrically connected. The two chambers (C and B) are filled with mercury which is covered with a special oil preparation, which acts as a seal and a lubricant. (Do not under any conditions substitute ordinary machine or lubricating oil.) A tubular iron plunger (H) with a fine wire resistance wound around it, and mica insulated from the plunger, is immersed in the mercury. The lower end of the winding (D) is electrically connected to the plunger (H) and the upper end is insulated from the plunger but electrically connected to the needle "E" at "F." The needle, which is insulated from the plunger (H) makes connection with the mercury (B). Current, after entering the voltage regulator at 40, must flow through all the resistance winding above the mercury, before reaching the needle and passing out at 39. The movement of the plunger changes the amount of the resistance winding which is above the mercury and as this resistance is in series with the shunt field, a corresponding change in shunt field current is accomplished.

The coil 33 in series with the hand temperature regulator (described below) is directly across the generator brushes so that any change in the generator pressure changes the current flow in coil 33. Coil 33 is an electro-magnet surrounding and actuating the plunger (H). When the generator speed increases its pressure increases for an instant, but this increased pressure increases the current in coil 33 and raises the plunger (H), which in turn exposes more of the resistance winding above the mercury and so increases the shunt field resistance, cutting down the generator's pressure. A decrease in speed will correspondingly decrease the shunt field resistance and tend to raise the voltage. Any change is only momentary, however, as the change in shunt field resistance compensates for the tendency toward voltage change due to speed changes. In this manner the voltage of the generator is maintained practically constant (at about 7 volts). Constant voltage regulation results in a tapering charge of the battery, that is, a high charging rate when the battery is low and a gradual decrease in current flow until the battery is charged, when very little current flows.

Temperature Regulator.—The hand temperature regulator acts as an ordinary rheostat. Moving the lever "N" toward 37 cuts down the average flow through coil 33. This results in the plunger (H) operating at a lower point as an average. In turn this means that more of the resistance winding will be submerged, cutting down the resistance of the field circuit and increasing the charging rate. Moving the lever away from 37, by the same process, decreases the charging rate. The lever is adjusted by hand. During very cold, winter weather, it should be set at 0°. During moderately warm spring or fall weather, or when starter is used only moderately, it should be set at 50°. During very hot, summer weather or when the starter is used but little and long trips are taken, the lever should be set at 100° to prevent over charging the battery. To prevent complete failure of the generator in case the contact at "N" becomes defective, the connections 37 and 38 are made, this giving the same generator voltage with a defective contact at "N" as would be the case were the contact O. K., and the lever in the hot weather position (100°). Proper manipulation of the lever will keep the battery properly charged under all conditions.

Testing.—When running free as a motor with only the slipping clutch as the retarding force, the generator should not take over 4.5 amperes. The relay should close at 400 to 425 R. P. M. The output should be about 5 amperes at 500 R. P. M., 20 amperes at 1000 R. P. M., 26-35 amperes at 1500 R. P. M. The charging current will vary with the state of charge of the battery.

The motor should run at 2100 R. P. M., and take about 45 amperes, when running free.

Oiling.—Put 4 or 5 drops of light engine oil in each of the motor-generator oilers every two weeks. If the car is driven more than 500 miles in two weeks the oiling must be done every 500 miles.

Lamps.—Head lamps are 7 volts, 24 cp. Dome lamp, tonneau lamp, tail lamp and side lamps are 7½ volts, 4 cp., 1 inch round type bulbs. Dash lamp and license lamp are 4 volts, 4 cp., ¾ inch round type bulbs.

Plate No. 208

PACKARD

MODELS 1-38 AND 3-48 (1913-14) DELCO STARTER-GENERATOR. BIJUR REGULATOR BOSCH DUAL IGNITION

BATTERY.—Battery is 6 volt, 150 ampere-hour, or 8 volt, 100 ampere-hour. The 8-volt battery is recommended, as it gives a higher cranking speed. The two-wire system is used. A 6-volt, 40-ampere hour battery, or set of dry cells, is used to supply current for ignition when starting.

IGNITION.—**Bosch Dual.** Breaker contacts separate .014 to .016 inch. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper. The magneto is further treated on Page 182.

OILING.—Put 3 or 4 drops of light engine oil in the magneto oilers every two weeks. Put a small amount of vaseline on the fiber bumper of the contact arm, applying with a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Spark should occur when the piston entering the power stroke is on top dead center, spark control lever within one inch of the fully retarded position. The marks "O" on the magneto couplings should both line up when putting the magneto in place. The leather washer which fits between the couplings has holes slightly off the center to facilitate alignment. The magneto chain gears should line up with the "O" marks on the chain links when the "O" on the upper gear is on top and the "O" on the lower gear is on the bottom. These marks so line up every 40 revolutions. Care should be taken when removing or replacing either the magneto driving shaft flange or magneto not to move the magneto shaft or gear shaft, as one complete turn will throw out the magneto timing, although the marks and holes line up. These marks should be lined up when the exhaust valve of No. 1 cylinder is open.

FIRING ORDER.—The firing order is 1, 4, 2, 6, 3, 5.

SPARK PLUG GAPS.—Spark plug gaps are .020 to .023 inch.

STARTER-GENERATOR.—Starter and generator are combined into one frame, but are electrically separate. Running freely, starter takes 45 amperes, armature revolving at 2100 R.P.M. Generator output regulation is by Bijur vibrating regulator. Maximum charging rate is 10 amperes, reached at 950-1000 R.P.M. of the armature or 20 miles per hour.

OILING.—Put 4 or 5 drops of light engine oil in the starter-generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 400-425 R.P.M. of the armature or 8-10 miles per hour and opens at 375-400 R.P.M. of the armature or 6-8 miles per hour. Adjust the relay spring tension and air gap between the moving member and coil core so that the contacts close when the voltage of the generator reaches 6.5 to 7.75 volts, and open with a discharge current of 0-1 ampere from the battery. Resurface the contacts when necessary with fine emery cloth.

REGULATOR.—**Bijur,** replacing Delco Mercury Regulator. To adjust the regulator, connect a voltmeter across terminals 1 and 3 of the generator and an ammeter between the regulator terminal 5 and terminal X of the cutout. Remove the adjusting hole plug in the regulator case and insert the special toothed wrench used for adjusting the standard Bijur regulators. Regulate the spring tension until the generated voltage is 7.1 volts for the 6-volt battery or 9.3 volts for the 8-volt battery, charging current being 10 amperes in both cases, generator armature driven at 950-1000 R.P.M. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service. Turn the reversing switch handle at the top of the regulator case through 90° every two weeks, or 500 miles of travel.

LAMPS.—Head lamps are 6-8 volt, 24 cp. Dome, tonneau, tail and side lamps are 6-8 volt, 4 cp. Dash and license-plate lamps are 3-4 volt, 4 cp.

NOTE.—Starter-generator terminals are arranged as shown in Plate No. 295A on the Model 3-48 cars. On the Model 1-38 cars, they are arranged 4, 3, 2, 1 from the engine outward.

Alter, Model 4-27 (1915-16), Remy System

Plate No. 209

Alter

Model 427 (1915-16) Remy Starting and Lighting System Remy Ignition

Battery.—Battery is 12 volt, 45 ampere-hour. The positive (+) terminal is grounded.

Ignition.—Breaker contacts should open .020 inch to .025 inch.

Care.—Should they become badly burned or pitted, resurface with a very fine, flat jeweler's file or a piece of No. 00 sand paper.

Timing.—Breaker contacts should begin to separate when the piston entering power stroke is on top dead center, spark control lever within 1 inch of the fully retarded position.

Firing Order.—The firing order is 1, 2, 4, 3.

Spark Plug Gaps.—The spark plug gaps should be .028 inch to .031 inch. The brass base of the coil must be well grounded as it serves as one terminal of the low tension circuit.

Starter.—The following data applies to the Model 129-B motor-generator used, when operating as a starting motor:

Torque (with 6" pulley)	R. P. M.	Amperes	Volts
0 lbs.	1100-1200	6-10	12-13
8 lbs.	900-1000	20-30	11.4-11.8
12 lbs.	800-900	30-40	11.3-11.5
20 lbs.	600-700	40-50	10.5-10.8
30 lbs.	500-600	70-80	10.0-10.5
32 ft. lbs.	Lock torque	300-350	10.

Generator.—Generator current regulation is by vibrating regulator. Relay is combined with the regulator. Relay contacts should open .012 inch to .015 inch. Clean them by drawing a piece of soft paper between them. The air gap between the armature (moving member) and the coil core should be .012 inch to .015 inch, when contact points are closed. Relay should close at 8-10 miles per hour.

The following data applies to the Model 129-B motor generator when operating as a generator, all tests to be made without ignition:

Amperes	R. P. M.	Volts
0	1050-1140	13.0-13.5
5	1200-1350	14.0-14.5
7.5	1250-1450	14.5-15
6.5	6000	14.0-15

Oiling.—Put 6-8 drops of light engine oil in each of the generator oilers every two weeks. If the car is run more than 500 miles in two weeks, the oiling must be done every 500 miles.

Fuse.—Generator circuit fuse is 15 ampere. Fuses in the lighting and ignition circuits are 4 ampere.

Lamps.—Head lamps are 12-14 volts, 20 cp. Tail lamp is 12-14 volts, 2 cp.

Mod 1 Number.—Motor-generator is model No. 129-B

Templar, Model 445 (1918), Remy System

Plate No. 210

Templar

Model 445 (1918) Remy Starting and Lighting System Remy or Bosch Ignition

Battery.—Battery is 6 volt, 100 ampere-hour. The negative (—) terminal of the battery is grounded.

Ignition.—Some cars are equipped with a Bosch magneto and some with a Remy battery ignition system, the equipment being optional.

Care.—Clean contacts with gasoline whenever necessary. Should they become badly burned or pitted, resurface them with a very fine, flat jeweler's file or a small strip of worn No. 00 sand paper. Further directions for the care of and the internal circuits of the magneto are given on Page No. 186. Battery timer contacts should open .020 inch to .023 inch. Magneto breaker contacts should open .014 inch to .016 inch.

Spark Plug Gaps.—The proper spark plug gap with battery ignition is .028 inch to .031 inch. The proper spark plug gap when magneto ignition is used is .018 inch to .023 inch.

Timing.—Contacts should just begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 3, 4, 2.

Starter.—The starter is connected to the engine by a Bendix drive. The following data applies to the Model 305-C starter used:

Torque (with 6" pulley)	R. P. M.	Amperes	Volts
4 lbs.	2500	110-130	5.4-5.6
8 lbs.	1900	165-175	5.1-5.4
12 lbs.	1500	215-225	4.8-5.2
16 lbs.	1000	265-275	4.6-4.9
20 lbs.	650	325-335	4.3-4.5
9 ft. lbs.	Lock torque	540-560	3.5-3.65

Put several drops of light engine oil in each of the motor oilers once every month.

Generator.—Voltage regulation is by third brush system. There is also a thermostat to reduce the charging rate when the high initial charging rate tends to overheat the battery. The following data applies to the generator (No. 234-B), all tests to be made with relay in circuit and thermostat contacts closed:

Amperes	R. P. M.	Volts
0	515	6.4
7	745	7.1
14	1000	7.9
22	1800	8.6
21	2000	8.6
17	2500	8.2

Spring tension on the main brushes should be 17 to 20 oz. Spring tension on the third brush should be 13 to 17 oz. Field draws 5 amperes at 6.4 volts, current flowing. Once every two weeks or every 500 miles put 4 or 5 drops of light engine oil in each of the generator oilers.

Lamps.—Head lamps are 6-8 volts, 18 cp. Dimmer lamps are 6-8 volts, 4 cp. Spot light is 6-8 volts, 36 cp. Tail lamp is 6-8 volts, 2 cp. Dash lamp is 6-8 volts, 2 cp. Inspection lamp is 6-8 volts, 2 cp.

Plate No. 211

Chalmers

Models 24 (1914) 26 ; 29 (1915)
Entz Starting and Lighting System
Bosch or Atwater-Kent Ignition

Battery.—Battery is 18 volt, 50 ampere-hour. The two wire system is used.

Ignition.—Ignition operates at 6 volts pressure. In connecting battery see that no greater pressure is applied to the ignition circuit. On cars using the Atwater-Kent ignition system, contacts should separate .010 inch to .012 inch.

Care.—Contacts are made of tungsten metal. Clean them with gasoline when necessary. They will operate properly even though quite rough. They should be dark gray in color. Should contacts become excessively burned or corroded, the scale may be removed by drawing the contacts across a piece of fine emery cloth laid on a flat surface as on the bed of a drill press. Finish the contacts on an oil stone.

Timing.—Spark should occur when the top dead center mark on the flywheel is $1\frac{1}{2}$ inches past the indicator, when Atwater-Kent ignition is used, and when the dead center mark is at the indicator, on cars using magneto ignition, spark control lever and breaker assembly being in fully retarded position in each case.

Firing Order.—The firing order is 1, 4, 2, 6, 3, 5. Use pure vaseline in the cup under the breaker head.

Starter.—The motor-generator is direct chain connected to the crankshaft. As there is no relay the system possesses what is known as the non-stalling feature, that is, the battery is always connected to the motor-generator when the switch is in the "On" position so will turn the armature as a motor, immediately starting the motor should it be stopped, or helping to propel the car when it is being driven at speeds below 6 miles per hour. This non-stalling feature is cut out when the switch is in the middle position, the motor-generator being entirely disconnected from the battery and the shunt field circuit broken.

Generator.—Generator voltage regulation is by reverse series field. The series and shunt fields work together when the unit is operating as a motor. This is what is known as a cumulative-compound winding. The unit should run at 100 R. P. M., as a motor.

Charging Rate.—Generator should begin to charge the battery at a high gear car speed of 6-8 miles per hour or 600 R. P. M., of the generator. If it is desired to stop charging the battery or to cut out the non-stalling feature, place the switch in the middle position.

Lamps.—On the Models 29 and 26 B, head lamps are 21 volts, 18-21 cp. Tail lamp is 21 volts, 2 cp. On the Model 24 cars, head lamps are 6-8 volts, 24 cp. Dimmer lamps are 6-8 volts, 4 cp. Dash lamp is 6-8 volts, 2 cp. Tail lamp is 6-8 volts, 2 cp. All other lamps are 6-8 volts, 4 cp.

Fuse.—Five ampere fuses are used in the light and horn circuits on all models.

CHALMERS

MODELS 35A AND 35B (1916-17). SERIAL NOS. 55,700 TO 82,000

MODEL 35C (1916-17). SERIAL NOS. 90,000 TO 94,000

WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM

REMY IGNITION

BATTERY.—Battery is 6 volt, 80 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Breaker contacts separate .015 to .020 inch. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Refill the grease cup under the breaker head with soft cup grease and turn down two turns every two weeks. Put a small amount of vascline on the fiber bumper of the contact arm, applying with a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when the flywheel marking "U.C. 1 & 6" is at the indicator, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 4, 2, 6, 3, 5.

SPARK PLUG GAPS.—Spark plug gaps are .025 inch.

STARTER.—Frame No. 700. Starter is connected to the engine through a Bendix drive. Running freely, starter takes 40 amperes at 5.5 volts, armature revolving 3500-5000 R.P.M. Torque at 1250 R.P.M. is 2.5 pound-feet, current being 130 amperes at 5.5 volts. Lock torque is 12.5 pound-feet, current being 400 amperes at 4 volts. Pressure of brushes on the commutator is $\frac{3}{4}$ to $1\frac{1}{4}$ pounds.

OILING.—Put 5 or 6 drops of light engine oil in each of the starter oilers every month.

GENERATOR.—Frame No. 208R. Generator voltage regulation is by vibrating regulator. Maximum output is 15 amperes at 6.8 volts, reached at 1800 R.P.M. of the armature or 25 miles per hour. The direction of rotation is counter-clockwise, looking at the commutator end.

Amperes	Generator Data	R.P.M.
0		700
8		1000
15		1800

Shunt field winding takes 1.5 to 2 amperes at 6 to 6.3 volts. Running freely as a motor, generator takes 3 amperes at 6 to 6.3 volts.

OILING.—Put 5 or 6 drops of light engine oil in the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY-REGULATOR.—Relay-regulator is mounted in the generator frame. Relay closes at 700-750 R.P.M. of the armature or 8-9 miles per hour and opens at 650-700 R.P.M. of the armature or 6-7 miles per hour. To adjust relay, regulate the spring tension until the contacts close when the voltage of the generator reaches 6.5 to 7 volts, battery disconnected. Then regulate the air gap between the armature and coil core until the relay opens with a discharge current from the battery of 1 to 3 amperes. Adjust the regulator to limit the voltage to 7.5 at 1000 R.P.M. with an 8 ampere resistance load. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface the tungsten contact on an oil stone and the silver contact with a scraper. The surfaces must be parallel. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 15 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp. There is a switch at the tail lamp to provide means of controlling the lamp from the rear of the car, in States where this is required.

FUSES.—Large fuse is 30 ampere. Small fuse is 15 ampere.

Pathfinder

12 Cylinder Models. (1917-18)

Delco Starting and Lighting System Delco Ignition

Battery.—Battery is 6 volt, 130 ampere-hour. The negative (—) terminal is grounded.

Ignition.—Two separate ignition coils, timers and distributors provide a complete and separate ignition system for cylinder block. Breaker contacts should open .018 inch to .020 inch.

Care.—Should they become badly burned or pitted, resurface them with a very fine flat jeweler's file or a small strip of worn No. 00 sand paper.

Timing.—Contacts should be just beginning to separate when the piston entering power stroke is on top dead center, spark control lever within one inch of the fully retarded position. (Make sure that breaker nearly is fully retarded when control lever is in this position.)

Firing Order.—The firing order is 1R, 1L, 4R, 4L, 2R, 2L, 6R, 6L, 3R, 3L, 5R, 5L.

Spark Plug Gaps.—The proper spark plug gap is .028 inch to .031 inch.

Oiling.—Once every two weeks put 4 or 5 drops of light machine oil in each of the oil holes beneath the cover on the top of the distributor. If the machine is run more than 500 miles in two weeks, oil every 500 miles. Thoroughly clean out and repack the lower distributor ball bearing with soft cup grease, two or three times a season.

Starter.—The starter (Model 86) is connected to the engine by a Bendix drive. It should develop at least 16 ft. lbs. lock torque. When running free it should not take over 40 amperes. Tests should be made with a line voltage of 3.5 volts to 3.8 volts, machine running. The motor requires absolutely no oil. Should the pinion stick on the shaft, clean the shaft well with gasoline.

Generator.—Generator voltage regulation (Model 87) is by third brush system. Relay should close at 8-10 miles per hour and open when the discharge current reaches 2 amperes. The generator should reach the neutral point (that is, the point at which it neither delivers current to, or receives current from the battery) at about 500 R. P. M.

The following data applies to the generator:

Hot—Output-Amp.	R. P. M.	Cold—Output-Amp.	R. P. M.
Neutral.....	500	Neutral.....	500 (or less)
11-13.....	900	11.5-13.5.....	900
16-18.....	1400	16.5-19.5.....	1400
15-17.....	1800	15.5-18.5.....	1800
14-16.....	2000	15-18.....	2000

Care.—The third brush should not be adjusted when the generator is hot from operation. Every two weeks, put 4 or 5 drops of light engine oil in each of the generator oilers. If the machine is run more than 500 miles in two weeks, oiling every 500 miles.

Lamps.—Head lamps are 6-8 volts, 15 cp. Dimmer lamps are 6-8 volts, 5 cp. Dash lamp is 6-8 volts, 2 cp. Tail lamp is 6-8 volts, 2 cp.

Circuit Breaker.—There is a circuit breaker located on the lighting switch, to take the place of fuses in the lighting circuits.

Model Numbers.—Generator is model No. 87; starter No. 86; starting switch No. 1966; combination lighting and ignition switch No. 1082; distributor No. 5156; ignition coils 2123; ammeter No. 6064.

Pathfinder

Model One-B (1915-16)

Delco Starting and Lighting System

Delco Ignition

Battery.—Battery is 6 volt, 130 ampere-hour. The negative (—) terminal is grounded.

Ignition.—There is a separate ignition system complete for each cylinder block. Breaker contacts should open .018 to .020 inch.

Oiling.—Clean out the lower distributor bearing and repack with soft cup grease several times a season. Remove the cover on top of the unit and put 5 or 6 drops of light engine oil in each of the oil holes exposed, every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Timing.—Contacts should begin to separate when piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1R, 1L, 4R, 4L, 2R, 2L, 6R, 6L, 3R, 3L, 5R, 5L.

Spark Plug Gaps.—The spark plug gap should be .025 inch to .030 inch.

Starter.—Starter is connected to the engine through a Bendix drive. The starter requires no oil. Should the Bendix pinion stick, thoroughly clean the worm shaft with gasoline.

Generator.—Generator current regulation is by third brush system.

Relay contacts should close at 8-10 and open at 6-8 miles per hour. They should separate about .030 inch. Clean by drawing a piece of soft paper between them. If necessary, resurface with a piece of worn No. 00 sand paper.

The generator output should be 14-16 amperes at 20-22 miles per hour. The third brush will vary the output between 12 and 20 amperes. The maximum charging rate should not exceed 18 amperes, all lights "Off."

Oiling.—Put several drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.

Lamps.—Head lamps are 6-8 volts, 18 cp. Dimmer lamps are 6-8 volts, 4 cp. Dash lamp is 6-8 volts, 2 cp. Tail lamp is 6-8 volts, 2 cp.

Circuit Breaker.—There is a vibrating type circuit breaker to take the place of fuses in the lighting circuit. It should take about 25 amperes to start this device vibrating, but once vibrating, a current of 3 to 5 amperes will cause it to continue vibrating.

Pathfinder

1915

Westinghouse Starting and Lighting System Westinghouse Ignition

Battery.—Battery is 6 volt, 130 ampere-hour. The positive (+) terminal is grounded.

Ignition.—The ignition system and generator is combined into one unit. The breaker is operated direct from the armature shaft. The centrifugal weights perform the double duty of automatically advancing and retarding the spark in relation to the engine speed, and of closing the timer contacts at the proper time. As these weights are revolved, they bear against the fiber bumper on the contact arm, pushing it down and causing the contact points to be brought together. As the weights are moved further, their bearing surface passes off the fiber bumper, which allows the spring to force contact arm upwards, causing the contacts to be quickly separated. As the speed increases, the weights are thrown out from the center, and automatically advance the time of opening of the contacts, hence advancing the spark. The weights are so shaped that they permit the contacts to be closed a greater part of the revolution, as the spark advances, resulting in a uniform spark at all speeds.

Adjustment.—When the engine is not running and one of the weights is depressing the fiber bumper, the air gap between the bumper lever and the stop should be $\frac{3}{64}$ of an inch. This distance must be correct before the contact clearance is adjusted. With this distance correct, the contacts should be separated .005 inch to .008 inch when the contact arm or bumper lever is resting on the stop. Interrupter weights should turn freely on their supporting pins and their surfaces should clear the back of the spring support by .01 inch. After making adjustments, see that both weights depress the contact lever sufficiently that positive connection between the contacts is assured when engine is cranked very slowly by hand. If they do not, there will be a tendency of missing at low speed, especially if contacts are worn or otherwise not in first-class condition. When the weights are in the inner (or retarded) position the springs should just touch the fiber covered pins without exerting any appreciable pressure on them. If it is necessary to adjust these springs, always do so by bending the supporting arms, not the springs themselves. Distributor brushes should move freely in their holders. The springs should exert just enough pressure on them to force their ends $\frac{1}{2}$ inch from holder. They should be retained by the springs so that they do not tend to fall out. The gears should be so meshed that the mark on the edge of the distributor (large) gear lines up with the tooth on the small gear (on the armature shaft) which is slightly beveled. The two screws holding the distributor plate in place make connection between the ignition coil and the generator. They must both be screwed firmly in place to complete the coil circuit.

Timing.—To time generator to engine, first turn engine until the piston of No. 1 cylinder is on top dead center, both valves closed, then remove distributor plate and turn generator armature back until the mark on the distributor brush holder lines up with the mark on the end bracket. Connect to engine in this position and connect spark plug to the distributor according to the firing order. Should timer contacts become badly burned or pitted, resurface them with a fine, flat jeweler's file or a strip of worn No. 00 sand paper.

Firing Order.—The firing order is 1, 4, 2, 6, 3, 5.

Spark Plug Gaps.—Spark plug gaps should be about .023 inch.

Starter.—Starter is connected to the engine through a Bendix drive. It should run at 1500 R. P. M., when delivering 2 pound-feet torque. It should develop 11.5 pound-feet lock torque, taking about 400 amperes.

Oiling.—Refill the wicked oil cup under the starter bearings with light machine oil every month.

Generator.—Generator charging current regulation is by reverse field. Current taken by the lamps does not flow through the series winding, hence has but little effect on the charging rate. Generator should deliver about 15 amperes at 7 volts, reached at about 2500 R. P. M. Charging current should be .5 to 1.5 amperes at closing and .75 to 1.25 amperes at opening of relay contacts. The air gap between relay armature (moving member) and coil core should be .027 inch to .030 inch. Contacts should separate .013 inch to .017 inch. Adjust by bending the brass prongs. Clean contacts by drawing a piece of unglazed paper between them. Should they be badly burned or pitted, resurface them with a piece of well worn No. 00 sand paper, drawing a piece of unglazed paper between them, to remove all grit, and adjust, before again putting into service.

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Lamps.—Head lamps are 6-8 volts, 15 cp. Dimmer lamps are 6-8 volts, 4 cp. Tail lamp is 6-8 volts, 2 cp.

Plate No. 215

Pathfinder

Models 8 A-B-C, 1916
Westinghouse Starting and Lighting System
Westinghouse Ignition

Plate No. 216

Battery.—Battery is 6 volt, 100 ampere-hour. The positive (+) terminal is grounded.
Ignition.—Breaker contacts should separate .006 inch to .008 inch. Should they become burned or pitted, affecting the ignition, resurface them with a fine, flat jeweler's file. The springs should exert just enough pressure on the distributor brushes to force them $\frac{1}{4}$ inch past the top of the holder when the distributor cap is removed, but should retain them firmly so that they do not tend to fall out. Brushes must move freely in their holders. Be sure that both brushes are in place when replacing the rotor. (There is a brush on both top and bottom side of the rotor).

Timing.—Contacts should begin to separate when the piston entering power stroke is on top dead center, spark control lever within one inch of the fully retarded position. (First see that breaker assembly is fully retarded when control lever is in the fully retarded position). Contacts are beginning to separate when the end of the distributor rotor is directly opposite the V notch on the rim of the case.

Firing Order.—The firing order is 1, 4, 2, 6, 3, 5.

Spark Plug Gaps.—Spark plug gaps should be about .025 inch.

Ballast Resistor.—There is a ballast resistor in the ignition switch. A fuse must not be permanently substituted for this resistor. In case it is necessary to operate the car with the ballast defective, a 5 ampere fuse may be used temporarily, but the ballast must be replaced as soon as possible, as continued operation without it will result in serious burning of the timer contacts.

Oiling.—Put 3 or 4 drops of light machine oil in the oil cup at the side of the breaker assembly unit every month. If car is driven more than 1000 miles in a month, the oiling must be done every 1000 miles.

Starter.—Starter is connected to the engine through a Bendix drive. The Frame No. 318 starter should run at 1500 R. P. M., when delivering 2 pound-feet torque. It should develop 11.5 pound-feet lock torque, taking about 400 amperes. Frame No. 750 motor should run at 1050 R. P. M., when delivering 3.5 pound-feet torque. It should develop 17.5 pound-feet lock torque, taking about 500 amperes.

Oiling.—Put several drops of light engine oil in each of the starter oilers every month.

Generator.—Generator Frame No. 400 voltage regulation is by a vibrating regulator. Relay is combined with the regulator. The charging current should be about 1.5 amperes at closing and the discharge current 1.25 amperes at opening of relay contacts. The gap between relay armature (moving member) and coil core should be .027 inch to .030 inch. Contacts should separate .013 inch to .017 inch. Adjust by bending brass prongs. Clean relay and regulator contacts by drawing a piece of unglazed paper between them. If badly burned or pitted, resurface them with a piece of well worn No. 00 sand paper, drawing a piece of unglazed paper between them, to remove all grit, before again putting into service. The output of generator Frame No. 400 should be 14 amperes at 7.5 volts. Generator Frame No. 240 charging current regulation is by reverse series field. The current taken by the lights does not flow through the series field hence it has but little effect on the charging rate.

GENERATOR DATA, FRAME No. 240

Speed R. P. M.	Total Output Amperes	Charging Rate, No Lamps Amperes
400	2	1.0- 1.5
500	5-6	2.5- 3.0
750	10	6.0- 6.5
1000	13	8.5- 9.0
1250	15-16	9.5-10.0
1500	16-17	10.5-11.0
2000	18	11.0-12.0
2500	18-19	12.
3000	19	12.

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Lamps.—Head lamps are 6-8 volts, 15 cp. Dimmer lamps are 6-8 volts, 4 cp. Dash lamp is 6-8 volts, 2 cp. Tail lamp is 6-8 volts, 2 cp.

Fuses.—Fuses are 20 ampere.

Plate No. 217

Chandler

1914-15

Westinghouse Starting and Lighting System

Bosch Magneto Ignition

Battery.—Battery is 6 volt, 100 ampere-hour. The positive (+) terminal is grounded.

Ignition.—Magneto breaker contacts should open .015 inch to .017 inch. Should contacts become badly burned or pitted, resurface them with a fine, flat jeweler's file or a strip of worn No. 00 sand paper.

Timing.—Breaker contacts should begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position. The trailing edge of the armature should be $\frac{3}{4}$ inch past the edge of the pole piece it has just passed when the contacts begin to separate, breaker fully retarded.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—Spark plug gap should be about .027 inch.

Oiling.—Put 3 or 4 drops of light machine oil in each of the magneto oilers every month and a very small amount of vaseline on the fiber bumper of the contact arm. If car is driven more than a thousand miles in a month, the oiling must be done every 1000 miles.

Starter.—Starter is connected to the engine through a set of reduction gears shifted by the operator. Depressing the starting pedal meshes the idler gears with the flywheel gear and motor pinion and completes the starting circuit. There is an overrunning clutch in the large idler gear, to prevent the engine driving the starting motor. The oil in the clutch case provides ample lubrication for these gears. Starter should crank the engine at about 200 R. P. M.

Oiling.—Put several drops of light engine oil in each of the motor bearing oilers every month.

Generator.—Generator current regulation is by reverse series field. The frame of the generator acts as the positive (+) terminal. The two terminals on the generator head are both negative (—). The one marked "L" is connected to the lighting switch. Current flowing past this terminal does not flow through the series field so does not have any material effect on the generator voltage. The terminal marked "B" is connected to the negative (—) terminal of the battery. Current flowing past this terminal must flow through the series winding, hence it tends to reduce the generator voltage. If the wire leading from terminal "B" is disconnected, the wire leading from terminal "L" should also be removed, as otherwise the lights may burn out if generator is run. If it is necessary to run generator with battery disconnected or other high resistance in the charging circuit, ground terminal "B." When this is done terminal "L" may be connected, as the voltage will not rise above safe limits.

Relay.—Relay should close at 5 to 7 miles per hour.

Charging Rate.—The maximum charging rate should be about 12 amperes, reached at 20-25 miles per hour.

Oiling.—Put several drops of light engine oil in each of the generator oilers every two weeks. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.

Lamps.—Head lamps are 6-8 volt, 15 cp. Dimmer lamp is 6-8 volts, 4 cp. Dash lamp is 6-8 volts, 2 cp. Tail lamp is 6-8 volts, 2 cp.

Fuses.—Large fuses are 30 ampere. Small fuses are 3 ampere.

1915-16

Gray and Davis Starting and Lighting System. Bosch Ignition

Battery—Battery is 6 volt, 80 ampere-hour. The positive (+) terminal is grounded.

Ignition—Breaker contacts should open .015 inch to .017 inch.

Timing—Contacts should begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position. When contacts begin to separate, the trailing edge of the armature should be $\frac{3}{4}$ inch from the edge of the pole piece which it has just passed, breaker assembly fully retarded.

Firing Order—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gap—The spark plug gap should be .027 inch to .031 inch.

Care—Every month, put 3 or 4 drops of light machine oil in each of the magneto oilers. If the car is driven more than 1000 miles in a month, the oiling should be done every 1000 miles.

Starter—Starter is connected to the engine through a set of gears. Depressing the starting pedal moves the pinion along the keyed shaft until it reaches the flywheel gear. If the gears are in the proper position, they are meshed at once. If they are not, the spring on the shifting rod is compressed as the lever is moved further. As soon as the switch is closed, the motor armature begins to turn and the compressed spring forces the pinion into mesh with the flywheel gear. Starter should crank the engine at about 200 R. P. M. When running free starter should take about 35 amperes. It should run at 3500 R. P. M., with a terminal voltage of 3 volts and at 6600 R. P. M., with a terminal voltage of 5.5 volts; the voltage reading being taken when the motor is in operation in each case. The motor should deliver $1\frac{1}{2}$ lbs. torque on the rim of a 6 inch pulley, when running at 2400 R. P. M. It should take about 137 amperes when so running. The brush pressure on the commutator should be at least $3\frac{1}{2}$ lbs.

Oiling—Put several drops of light engine oil in each of the motor oilers every month.

Generator—Generator voltage regulation is by a vibrating regulator. Relay is combined with regulator. Relay should close at about 5 miles per hour.

Charging Rate—The normal charging rate should be about 9 amperes at 15 miles per hour. This rate increases to a maximum of about 12 amperes at 25 miles per hour.

Trouble Shooting—To test generator, connect together the two terminals of the generator which lead to the field coils and connect them to one terminal of a 6 volt battery. Then connect the other terminal of the generator to the other battery terminal. The generator should then run as a motor, at 320 R. P. M., and take 3 amperes. A variation of 10% above or below these readings is allowable but never more. If the readings do not fall within these limits, remove the regulator and repeat the test. Low speed, excessive current, or a vibrating of the ammeter needle indicates a grounded or short circuited armature. If speed is high and current is high but steady, the field coils are partially shorted or grounded, or connections are poor. To test the generator, connect together the two field terminals which lead to the regulator, and drive the generator at 750 R. P. M. It should deliver 10 amperes. Less current at this speed indicates short circuited field coils, defective brushes or brush connections, dirty commutator, partly grounded or short circuited armature, defective connections between the commutator bars and the armature windings, or the pole pieces are loose in the frame. To test the field windings, connect one terminal of a 6 volt battery to the generator frame and the other battery terminal to first one and then the other field leads on top of the generator. The ammeter should indicate not less than 1.09 amperes or more than 1.32 amperes. More current indicates short circuited or grounded windings. Less current indicates defective connections or brush contact. With a $7\frac{1}{2}$ ampere lamp load, the generator should charge the battery at 1 to 4.5 amperes, generator being driven at low speed, and at 8.5 to 11 amperes, generator running at 1750 R. P. M. or over.

Care—If it does not, the regulator contacts should be cleaned by drawing a piece of soft paper between them. If necessary, resurface them with a piece of well worn No. 00 sand paper. If cleaning will not produce the desired result, adjust the regulator.

Adjustment—Increasing the spring tension increases the output. Decreasing the spring tension decreases the output. When adjusting contacts, hold the upper contacts open while the lower ones are adjusted, until the desired output is attained. Then hold the lower contacts open while the upper set is adjusted. Then allow both pair of contacts to operate together. The generator should be running at about 1750 R.P.M., when adjusting regulator. Every month put several drops of light engine oil in each of the generator oilers. If car is driven more than 1000 miles a month, oil every 1000 miles.

Lamps—Head lamps are 6-8 volts, 18 cp. Dash lamp is 6-8 volts, 2 cp. Tail lamp is 6-8 volts, 2 cp. All other lamps provided are 6-8 volts, 4 cp.

Plate No. 218

Plate No. 219

DORRIS MODEL I-A-4 (1915) WESTINGHOUSE STARTING AND LIGHTING SYSTEM WESTINGHOUSE IGNITION

BATTERY.—Battery is 6 volt, 100 ampere-hour. The positive (+) terminal is grounded. There is also a set of dry cells connected in series which can be used for the ignition system.

IGNITION.—The ignition system and generator are combined into one unit. The breaker is operated directly from the armature shaft. The centrifugal weights perform the double duty of closing the breaker contacts and automatically advancing and retarding the spark in relation to the engine speed. When the engine is not running and one of these weights is depressing the fiber bumper, the air gap between the bumper lever and stop is $\frac{3}{64}$ inch. This distance must be correct before the contact gap is adjusted. Breaker contacts separate .005 to .006 inch when the contact arm or bumper is resting on the stop. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

Timing.—To time the generator to the engine, first turn the engine until the piston in No. 1 cylinder is on top dead center entering power stroke. Then remove the distributor plate and turn the generator armature back until the mark on the distributor brush holder lines up with the mark on the end bracket. Connect to engine in this position and wire spark plugs to distributor in accordance with the firing order.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plug Gaps.—Spark plug gaps should be .020 to .025 inch.

STARTER.—Starter is connected to the engine through a Bendix drive.

Oiling.—Put several drops of light engine oil in each of the motor oilers every week.

GENERATOR.—Frame No. 280. Generator current regulation is by reverse series field.

Generator Data		
Battery Amperes	Total Output	R.P.M.
1	2.2	300
3.6	8	500
7.4	14	1000
9.2	15.5	1500
9.6	16.2	2000
10	17	2500

The current for the lights does not pass through the reverse series field, so when the lights are turned on the output automatically increases to supply the extra current used, keeping the charging rate practically constant. Maximum charging rate of 9-10 amperes is reached at 1500 R.P.M. of armature.

Oiling.—Put 4 or 5 drops of light engine oil in the distributor and generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 300 R.P.M. of armature or 8 miles per hour, and opens at 250 R.P.M. or 6 miles per hour. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volts, 15 cp. Dimmer lamps are 6-8 volts, 4 cp. Dash lamp is 6-8 volts, 2 cp. Tail lamp is 6-8 volts, 2-4 cp. All other lamps are 6-8 volts, 4 cp.

FUSES.—Head lamp fuses are 15 ampere. Side lamp fuses are 5 ampere. Dash and tail lamp fuses are 5 ampere.

Plate N . 220

DORRIS

MODEL 1A-6 (1916)

WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM BOSCH MAGNETO IGNITION

BATTERY.—Exide, 6 volt, 100 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Model DU6. Breaker contacts separate .014 to .016 inch. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Put 3 or 4 drops of light engine oil in each of the magneto oilers every month. Put a small amount of vaseline on the fiber bumper of the contact arm, applying with a toothpick. If the car is driven more than 1000 miles in a month, these attentions must be given every 1000 miles.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .025 inch.

STARTER.—Frame No. 318. Starter is connected to the engine through a Bendix drive. The lock torque developed by the starter is 11.5 pound-feet, current being 400 amperes at 4.25 volts. Torque at 1400 R.P.M. is 2 pound-feet, current being 125 amperes at 5.5 volts.

OILING.—Put 5 or 6 drops of light engine oil in the starter oilers every month.

GENERATOR.—Model No. 208. Generator current regulation is by reverse series field. Maximum charging rate is 11-15 amperes, reached at 1500 R.P.M. of the armature or 25 miles per hour.

Amperes	Generator Data	R.P.M.
0		425
8		650
11-15		1500

With generator hot, the maximum charging rate reduces to 9-12 amperes. Running freely as a motor, the generator takes 2.5 to 3.5 amperes at 6 to 6.3 volts. The shunt field winding takes 1.5 to 2.5 amperes at 6 to 6.3 volts.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 425-475 R.P.M. of the armature or 8 miles per hour, and opens at 375-425 R.P.M. of the armature or 6 miles per hour. Relay must be adjusted to close when the voltage of the generator reaches 7 to 7.5 volts, battery disconnected. Relay must open when the discharge current from the battery reaches 0-2 amperes. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 15 cp. Side lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp.

0 lb. ft.	4000	40
4 lb. ft.	1000	180
6 lb. ft.	800	230
8 lb. ft.	700	280
14 lb. ft.	Lock	450

OILING.—Put 5 or 6 drops of light engine oil in the starter oilers every month.

GENERATOR.—Model No. 208. Generator current regulation is by a reverse series field. Maximum charging rate is 11-15 amperes, reached at 1500 R.P.M. of the armature or 25 miles per hour.

Amperes	Generator Data	R.P.M.
0		425
8		650
11-15		1500

With generator hot, the maximum charging rate reduces to 9-12 amperes. Running freely as a motor, the generator takes 2.5 to 3.5 amperes at 6 to 6.3 volts. The shunt field winding takes 1.5 to 2.5 amperes at 6 to 6.3 volts.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 425-475 R.P.M. of the armature or 8 miles per hour, and opens at 375-425 R.P.M. of the armature or 6 miles per hour. Relay must be adjusted to close when the voltage of the generator reaches 7 to 7.5 volts, battery disconnected. Relay must open when the discharge current from the battery reaches 0-2 amperes. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt 15 cp. Side lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp.

Briggs-Detroit

Model D (1915)

Remy Starting and Lighting System. Remy Ignition

Battery.—Battery is 6 volt, 100 ampere-hour. The positive (+) terminal is grounded.

Ignition.—Breaker contacts should separate .020 inch to .025 inch.

Care.—Should they become badly burned or pitted, resurface them with a fine, flat jeweler's file or a strip of worn No. 00 sand paper.

Timing.—Contacts should begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 8, 3, 6, 4, 5, 2, 7.

Spark Plug Gap.—The spark plug gap should be about .020 inch.

Starter.—The starter is connected to the engine through a set of reduction gears and a Bendix drive. The following data applies to the Model 182-A motor used:

Torque (with 6" pulley)	R. P. M.	Amperes	Volts
0 lbs.	1400-1600	55- 70	6.0
4 lbs.	1110-1210	80- 95	5.7-5.8
8 lbs.	920- 950	95-120	5.5-5.6
12 lbs.	790- 820	120-140	5.4-5.5
16 lbs.	600- 700	140-160	5.2-5.3
24 lbs.	520- 540	190-200	4.9-5.
32 lbs.	430- 440	225-250	4.7-4.9
40 lbs.	300- 400	250-270	4.5-4.6
45-55 ft. lbs. ...	Lock torque	520-550	3.2

Oiling.—Put a few drops of light engine oil in starter bearing oilers every month. Also lubricate the reduction gears well with light or medium engine oil.

Generator.—Generator current regulation is by vibrating regulator. Relay should close at about 8 and open at about 6 miles per hour. Relay contacts should open .012 inch to .015.

Care.—Clean them frequently by drawing a piece of soft paper between them. After cleaning contacts, make sure that they are not closed, as if they are left in this position, the battery will be rapidly discharged through the generator. To separate the contacts, do not use force, but start the engine and speed it up until the ammeter indicates charge after which the contacts will open of their own accord when engine is stopped or slowed down sufficiently. If it is not convenient to operate the engine, disconnect the wire leading from the relay-regulator to the ammeter and separate the contacts by a slight pressure of the finger if they do not open of their own accord. Be sure to make a good tight connection when replacing the wire, as this is the charging circuit. The air gap between the relay armature (moving member) and the core of the magnet coil should be .012 inch to .015 inch when contacts are closed.

Regulator contacts should open .012 inch to .015 inch. Clean them by drawing a piece of soft paper, between them. Should regulator or relay contacts become badly burned or pitted, they should be resurfaced with a piece of well worn No. 00 sand paper and a piece of soft paper drawn between them to remove any material lodged between them. They will probably need adjusting after cleaning. Increasing the spring tension will increase the output. Decreasing the spring tension will decrease the output. Both of the regulator contacts should operate together. The following data applies to the generator:

Amperes	R. P. M.	Volts
0	370	6.0
7	490	6.5
14.5	2200	6.9

A pressure of 5.9 volts will cause 3 to 3.5 amperes flow through the field winding. A pressure of 5.8 volts will cause 4 to 4.5 amperes flow through the generator, rotating the armature at 430 R. P. M., running free. A higher speed indicates short circuited or grounded field windings. Less speed or a greater current indicates short circuited or grounded armature windings or commutator, damp armature or tight bearings. Periodic swinging of the ammeter needle indicates a grounded or short circuited armature coil.

Oiling.—Put several drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, oil every 500 miles.

Lamps.—Head lamps are 6-8 volts, 15 cp. Dash lamp is 6-8 volts, 2 cp. Tail lamp is 6-8 volts, 2 cp.

Fuses.—Lighting fuses are 4 ampere. There is also a 15 ampere fuse on the relay-regulator base. This fuse is in the shunt field circuit and will burn out if the generator is run at high speed with high resistance in the charging circuit. Remove this fuse if it is necessary to run the generator with the battery disconnected.

Briggs-Detroit, Model D (1915), Remy System

Plate No. 223

SINGER

SERIES 19 (1919). SERIAL NOS. 1901 TO 1989.

WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM BOSCH IGNITION

BATTERY.—Willard, SJR-4, 6 volt, 115 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Type DU-6. Breaker contacts separate .015 inch. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Put 2 or 3 drops of light engine oil in each of the magneto oilers every two weeks. Put a small amount of vaseline on the fiber bumper of the contact arm, applying with a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 4, 2, 6, 3, 5.

SPARK PLUG GAPS.—Spark plug gaps are .022 inch.

STARTER.—Frame No. 750. Starter is connected to the engine through a Bendix drive.

Starter Data

Torque	R.P.M.	Amperes	Volts
0	3500-5000	40	5.5
8 lb. ft.	1100	170	5.5
17.5 lb. ft.	Lock	500	4.0

OILING.—Put 5 or 6 drops of light engine oil in each of the starter oilers every month.

GENERATOR.—Frame No. 208. Generator current regulation is by reverse series field. Maximum current output is 11-15 amperes, reached at 1500 R.P.M. of the armature or 25 miles per hour.

Amperes	Generator Data	R.P.M.
0		425
8		650
11-15		1500

Shunt field winding takes 1.5 to 2.5 amperes at 6 to 6.3 volts. Running freely as a motor, generator takes 2.5 to 3.5 amperes at 6 to 6.3 volts. The current taken by the lamps does not pass through the series field, hence has but little effect on the charging rate.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted in the generator frame. Relay closes at 425-475 R.P.M. of the armature or 8 miles per hour, and opens at 375-425 R.P.M. of the armature or 6 miles per hour. Relay must be adjusted to close when the generator voltage reaches 7-7.5 volts, battery disconnected, and opens with a discharge current of 0-2 amperes from the battery. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 32 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp.

FUSES.—Fuses are 20 ampere.

Marion-Handley

Models K (1916) A-B (1917)

Westinghouse Starting and Lighting System Westinghouse Ignition

Battery.—Battery is 6 volt, 80 ampere-hour. The positive (+) terminal is grounded.

Ignition.—Breaker contacts should separate .006 inch to .008 inch. Should they be burned or pitted, resurface them with a fine, flat jeweler's file or a strip of worn No. 00 sand paper. The springs should exert just enough pressure on the distributor brushes to force them $\frac{1}{4}$ inch past the top of the holder when the distributor cap is removed, but should retain them firmly so that they do not tend to fall out. Brushes must move freely in their holders. Be sure that both brushes are in place when replacing the rotor. (There is a brush on both the top and bottom side of the rotor).

Timing.—Contacts should begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position. Contacts are beginning to separate when the distributor rotor is directly opposite the V notch on the rim of the case.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—Spark plug gaps should be about .025 inch.

Ballast Resistor.—There is a ballast resistor in the ignition switch. A fuse must not be permanently substituted for this resistor. In case it is necessary to operate the car with the ballast defective, a 5 ampere fuse may be used temporarily, but the ballast must be replaced as soon as possible, as continued operation without it will result in serious burning of the timer contacts.

Oiling.—Put 2 or 3 drops of light machine oil in the oil cup at the side of the unit every month. If the car is driven more than 1000 miles in a month, the oiling must be done every 1000 miles.

Starter.—Starter is connected to the engine through a Bendix drive. The Frame No. 318 starter, used on the 1916 cars should run at 1500 R. P. M., when delivering 2 pound-feet torque. It should develop 11.5 pound-feet lock torque, taking about 400 amperes. The Frame No. 700 starter, used on the 1917 cars, should deliver 2.5 pound-feet torque when running at 1200 R. P. M. It should develop 12.5 pound-feet lock torque, taking about 400 amperes.

Oiling.—Put 4 or 5 drops of light engine oil in each of the starter oilers every month. If starter is equipped with oil wells, keep cup filled.

Generator.—Generator voltage regulation is by a vibrating regulator. Relay is combined with the regulator. Relay should close at about 5 and open at about 3 miles per hour. The maximum generator output should be about 14 amperes, reached at about 20 miles per hour. The charging rate will vary with the state of charge of the battery, being 12-16 amperes when battery is discharged and gradually decreasing to 4 or 5 amperes as battery becomes charged. The generator voltage, hence output, is increased by increasing tension of regulator armature (moving member) spring and decreased by decreasing the tension of this spring. Before adjusting contacts and whenever necessary at other times, clean by drawing a piece of unglazed paper between them. If contacts are badly burned or pitted, it may become necessary to resurface them with a piece of well worn No. 00 sand paper. Draw a piece of unglazed paper between them to remove all grit before again putting into service.

Oiling.—Put several drops of light engine oil in each of the generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles. Fill the oil wells in the bottom of bearings with light machine or engine oil every three months.

Lamps.—Head lamps are 6-8 volts, 15 cp. Dimmer lamps are 6-8 volts, 2 cp. Dash lamp is 6-8 volts, 2 cp. Tail lamp is 6-8 volts, 2 cp.

Fuses.—Fuses are 15 ampere.

Plate No. 225

KING

MODEL C (1915) SERIAL NOS. 2200 TO 3200
MODEL D (1915-16). SERIAL NOS. 5000-8000
WARD LEONARD GENERATING, STARTING AND LIGHTING SYSTEM
ATWATER KENT IGNITION

BATTERY.—Battery is 6 volt, 80 ampere-hour. The two-wire system is used.

IGNITION.—Breaker contacts separate .010 to .012 inch. They are made of tungsten. When condition of contacts affects ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING.—Put a drop of light machine oil on each of the wearing parts of breaker and 4 or 5 drops in the hole beside notched shaft every two weeks. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.

TIMING.—Breaker contacts separate when piston entering power stroke is on top dead center, spark control in the fully retarded position.

FIRING ORDER.—The firing order is 1R, 4L, 3R, 2L, 4R, 1L, 2R, 3L.

SPARK PLUG GAPS.—Spark plug gaps are .027 to .031 inch.

STARTER.—Starter is connected to engine through a Bendix drive.

OILING.—Put 3 or 4 drops of light engine oil in oil hole on top of rear starter bearing every month. Every three months remove cup under bearing and repack with vaseline.

GENERATOR.—Generator current regulation is by a vibrating regulator. Relay is combinder with regulator. Maximum charging rate is 12-14 amperes reached at 20 miles per hour.

OILING.—Put 2 or 3 drops of light engine oil in rear generator bearing oiler every month. If car is driven more than 1000 miles in a month, oiling must be done every 1000 miles. Thoroughly clean out bearing and repack with soft cup or ball bearing grease every six months.

RELAY-REGULATOR.—Relay closes at 9-10 and opens at 8-9 miles per hour. Charging current is 1-3 amperes at closing and the discharge current 0-1 ampere at opening of relay. Clean relay and regulator contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service. Increasing spring tension on regulator armature increases output. Decreasing spring tension decreases output.

LAMPS.—Head lamps are 6-8 volt, 15 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash lamp is 6-8 volt, 2 cp. Tail lamp is 6-8 volt, 2 cp.

FUSES.—Fuses are 10 ampere.

Plate No. 226

Monroe

Model M-2 (1915)

Auto-Lite Starting and Lighting System Connecticut Ignition

Battery.—Battery is 6 volt, 85 ampere-hour. The negative (—) terminal is grounded.

Ignition.—Breaker contacts should open .018 inch to .020 inch. They are made of tungsten. They will operate properly even though quite rough. Should they become badly worn, affecting the ignition, the inner breaker mechanism should be renewed as directed on Page 50. In an emergency, contacts may be resurfaced enough to give service for 300 or 400 miles by drawing a piece of fine emery cloth between them.

Timing.—Contacts should begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—Firing order is 1, 2, 4, 3.

Spark Plug Gaps.—Spark plug gaps should be about .027 inch.

Oiling.—Refill the cup under the breaker head with pure vaseline and turn down every month. If car is driven more than a 1000 miles in a month, this must be done every 1000 miles. Do not put grease or oil in the cup.

Starter.—Starter is connected to engine through a Bendix drive. It should crank the engine at about 150 R. P. M., taking about 150 amperes. Cold engine, tight bearings, heavy oil or other obstructions will cause a greater current flow and reduce the speed.

Brushes.—Use only the special copper-carbon composition type brushes as furnished by the manufacturer, as ordinary carbon brushes will cause trouble and their use in either the motor or generator forfeits the guarantee.

Oiling.—Clean and repack starter bearings with soft cup grease every six months. Put in one or two drops of oil every month to keep grease soft. Do not oil the Bendix drive. Should pinion stick, clean shaft with gasoline.

Generator.—Generator current regulation is by reverse series field. Relay should close at 8-10 miles per hour, or 550-650 R. P. M., of generator armature, the charging current being .6 to 1 ampere at closing. Relay contacts should separate when the reverse current reaches 0 to 1 ampere.

Amperes	GENERATOR DATA, MODEL GB	R. P. M.
5		495-575
10		850-1035
12.5		1120-1370
15		1475-1810
17-19		2400-2800

If operated freely as a motor, generator armature should revolve at 200 R. P. M., taking 1.8-2 amperes. Much higher speed indicates damp, grounded or short circuited field coils. Greater current or lower speed indicates tight bearings or damp, grounded or short circuited armature windings or commutator. Periodic swinging of ammeter needle indicates grounded or short circuited armature coils or commutator bars. Shunt field should take about 1.2 amperes.

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Lamps.—Head lamps are 6-8 volts, 15 cp. Tail lamp is 6-8 volts, 2 cp.

Fuses.—Lighting fuses are 20 ampere.

Model Numbers.—Generator is Model GB. Starter is Model MF.

Auto-Lite Starting and Lighting System
Connecticut Ignition

Plate No. 227

MONROE Model M-3, M-4, M-6 (1917-18) Auto-Lite Starting and Lighting System Connecticut Ignition

Battery.—Battery is 6 volt, 80 ampere-hour. The negative (—) terminal is grounded.

Ignition.—Contacts should separate .018 inch to .020 inch. They are made of tungsten. They will operate properly even though quite rough. Should they become badly worn, affecting the ignition, the inner breaker mechanism should be renewed as directed on Page 50. In an emergency, contacts may be resurfaced enough to give service for 300 or 400 miles by drawing a piece of fine emery cloth between them.

Timing.—Contacts should begin to separate when piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plug Gaps.—Spark plug gaps should be .027 inch to .030 inch.

Oiling.—Refill cup under the breaker head with pure vaseline and turn down every month. If car is driven more than 1000 miles in a month, this must be done every 1000 miles. Do not put grease or oil in this cup.

Starter.—Starter is connected to engine through a Bendix drive. It should crank the engine at about 150 R. P. M., taking 100-150 amperes.

Oiling.—Clean and repack starter bearings with soft cup grease every six months. Do not oil the Bendix drive. Should pinion stick, clean shaft with gasoline.

Generator.—Generator current regulation is by reverse series field. Relay should close at 500-575 R. P. M., of generator armature. Charging current should be .5 to 1.5 ampere at closing, and 0 to 1 amperes at opening.

Amperes	GENERATOR DATA, MODEL GG	R. P. M.
5		750- 860
10		1225-1400
12.5		1600-1825
15		2125-2450
17-19		3200-3700

A variation of 1.5 amperes from these amounts is allowable. Output may be varied slightly by adjusting brush pressure. The pressure should be 1 to 1¼ pounds. If operated freely as a motor, armature should revolve at 350 R. P. M., taking 2.8 amperes. Greater speed indicates damp, grounded or short circuited field coils. Greater current or lower speed indicates tight bearings or damp, grounded or short circuited armature windings or commutator. Periodic swinging of ammeter needle indicates grounded or short circuited armature coils or commutator bars. Shunt field should take approximately 1.1 amperes.

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Lamps.—Head lamps are 6-8 volts, 15 cp. Dimmer lamps are 6-8 volts, 5 cp. Dash lamp is 6-8 volts, 2 cp. Tail lamp is 6-8 volts, 2 cp.

Fuses.—Fuses are 20 ampere.

Plate No. 228

PILOT

MODEL 6-45 (1916-17-18-19)

DELCO GENERATING, STARTING AND LIGHTING SYSTEM

DELCO IGNITION

BATTERY.—Battery is 6 volt, 80 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 2158. Breaker contacts separate .018 to .020 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING.—Put 3 or 4 drops of light engine oil in the distributor shaft bearing every two weeks. If the track of the rotor button in the distributor head is not well polished, apply a small amount of vaseline with a soft cloth. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when the piston entering the power stroke is on top dead center, spark control lever and breaker assembly advanced one-third on the 1919 cars and in the fully retarded position on the 1916-17-18 cars.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .030 inch.

STARTER:—86 & 104. Starter is connected to engine through a Bendix drive. Lock torque is 16 pound-feet, at 3.5 to 3.8 volts. Running freely, starter takes 40 amperes.

OILING:—Put several drops of light engine oil in the starter oilers on Model 86. Model 104 is of the oilless type.

GENERATOR:—89 & 103. Generator current regulation is by the third brush system. Generator begins to supply current at 500 R.P.M. of the armature or 8 miles per hour and reaches the maximum current output of 16 amperes at 1400 R.P.M. of the armature or 22 miles per hour.

Generator Data

Amperes	R.P.M.	Amperes	R.P.M.
Neutral	500	Neutral	500
10.5-12.5	900	10-12	900
15.5-18.0	1400	14-16	1400
13.0-17.0	2000	11-13	2000

Charging rate is varied by adjusting third brush setting. Loosen the two screws holding the third brush arm, and move the brush in a counter-clockwise direction (looking at commutator end) to increase the charging rate. Move the brush in a clockwise direction to decrease the charging rate. Tighten the holding screws and reseat brush after adjusting position.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—There is no relay. The circuit between the generator and the battery is controlled by the ignition switch.

LAMPS.—Head lamps are 6-8 volt, 15 cp. Dash and tail lamps are connected in series and are each 3-4 volt, 2 cp.

CIRCUIT-BREAKER.—A vibrating circuit-breaker takes the place of fuses. It requires 25 amperes to start the vibrator, but 3-5 amperes will cause it to continue.

Plate No. 229

Elcar

Models D, E, F and G (1917-18) Dyneto Starting and Lighting System Connecticut Ignition

- Battery.**—Battery is 6 volt, 85 ampere-hour. The negative (—) terminal is grounded.
- Ignition.**—Breaker contacts should separate about .020 inch. They are made of tungsten. They will operate properly even though quite rough. Should they become badly worn, affecting the ignition, the inner breaker mechanism should be renewed as directed on Page 50. In an emergency, contacts may be resurfaced enough to give service for 300 or 400 miles by drawing a piece of fine emery cloth between them.
- Timing.**—Contacts should begin to separate when piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.
- Firing Order.**—The firing order of the four cylinder cars is 1, 3, 4, 2. The firing order of the six cylinder cars is 1, 5, 3, 6, 2, 4.
- Spark Plug Gaps.**—Spark plug gaps should be .025 inch to .030 inch.
- Oiling.**—Refill the cup under the breaker head with pure vaseline and turn down every month. If car is driven more than 1000 miles in a month, this must be done every 1000 miles. Do not put grease or oil in the cup.
- Starter.**—Starter is connected to the engine through a Bendix drive. Cold engine, heavy oil, tight bearings or other obstructions, or damp, grounded or short circuited armature or field coils or commutator bars will cause high current and low speed during the cranking operation.
- Oiling.**—Saturate the wick at the commutator end of motor with light engine or machine oil and put a few drops of light engine oil in the driving end bearing every month.
- Generator.**—Generator current regulation is by third brush system. Relay should close at about 7 miles per hour. The maximum generator output should be about 11 amperes with machine hot or 13 amperes with machine cold, reached at about 16 miles per hour. This rate should reduce to 9-10 amperes at about 40 miles per hour. Clean relay contacts by drawing a piece of unglazed paper between them. If burned or pitted, resurface them with a piece of well worn No. 00 sand paper, drawing a piece of unglazed paper between them, to remove all grit, before again putting into service.
- Oiling.**—Put 4 or 5 drops of light engine oil in each of the generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.
- Lamps.**—Head lamps are 6-8 volts, 15 cp. Dimmer lamps are 6-8 volts, 4 cp. Dash lamp is 6-8 volts, 2 cp. Tail lamp is 6-8 volts, 2 cp.
- Fuse.**—Fuse is 15 ampere.

Plate No. 230

METEOR

MODELS 75 AND 80 (1916-17 AND 1919)

DELCO GENERATING, STARTING AND LIGHTING SYSTEM

DELCO IGNITION

BATTERY.—Battery is 6 volt, 90 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 2158. Breaker contacts separate .020 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING.—Put 4 or 5 drops of light engine oil in the ignition unit bearings every two weeks. If the track of the rotor button in the distributor head is not well polished, apply a small amount of vaseline with a soft cloth. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly one-third advanced.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 5.

SPARK PLUG GAPS.—Spark plug gaps are .030 inch.

STARTER.—Model Nos. 101 & 102. Starter is connected to the engine through a Bendix drive. Lock torque is 16 pound-feet at 3.5 to 3.8 volts. Running freely, starter takes 40 amperes.

OILING.—Starter bearings are of the oilless type.

GENERATOR.—Model No. 101. Generator current regulation is by the third brush system.

Generator begins to supply current at 500 R.P.M. of the armature or 7-8 miles per hour, and reaches the maximum current output of 14-16 amperes at 1400 R.P.M. of the armature or 18-22 miles per hour.

Generator Data					
Amperes	Cold Test	R.P.M.	Amperes	Hot Test	R.P.M.
Neutral		500	Neutral		500
10.5-12.5		900	10-12		900
15.5-18.0		1400	14-16		1400
13.0-17.0		2000	11-13		2000

Charging rate is varied by adjusting the third brush setting. Loosen the two screws holding the third brush arm, and move in a counter-clockwise direction (looking at the commutator end) to increase the charging rate. Move the third brush in a clockwise direction to decrease the charging rate. Tighten the holding screws and reseal the brush after adjusting position.

OILING.—Put 5 or 6 drops of light engine oil in the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—There is no relay. The generator-battery circuit is controlled by the ignition switch.

LAMPS.—Head lamps are 6-8 volt, 17 cp. Dash and tail lamps are each 6-8 volt, 2cp.

CIRCUIT BREAKER.—A vibrating circuit breaker takes the place of fuses. It requires 25 amperes to start the vibrator. While vibrating, the current is 3.5 amperes.

Meteor, Models 75-A and 80-A (1918), Delco System

Plate No. 231

Meteor

Models 75-A and 80-A (1918)
Delco Starting and Lighting System
Delco Ignition

Battery.—Battery is 6 volt, 85 ampere-hour. The negative (—) terminal is grounded.

Ignition.—There are two separate ignition coils, timers and distributors, providing a complete and separate ignition system for each cylinder block. Breaker contacts should separate .018 inch to .020 inch. Should they become badly burned or pitted, resurface them with a fine, flat jeweler's file or a strip of worn No. 00 sand paper.

Timing.—Contacts should begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

Spark Plug Gaps.—Spark plug gaps should be .028 inch to .030 inch.

Oiling.—Clean out the lower distributor bearing and repack with soft cup grease two or three times a season. Remove the cap on top of the distributor and put 4 or 5 drops of light engine oil in each of the oil holes exposed every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Starter.—Starter is connected to the engine through a Bendix drive. Motor should develop at least 16 pound-feet lock torque, terminal voltage measuring 3.5 to 3.8 volts. When running free, starter should not take more than 40 amperes.

Generator.—Generator current regulation is by third brush system. Although there is a relay, the circuit between generator and battery is broken when ignition switch is in "Off" position. Relay contacts should open about .030 inch. If badly burned or pitted, resurface them with a piece of worn No. 00 sand paper.

GENERATOR DATA, MODEL No. 87.

Cold		Warm	
Amperes	R. P. M.	Amperes	R. P. M.
Neutral	500 (or less)	Neutral	500
11.5-13.5	900	11-13	900
16.5-19.5	1400	16-18	1400
15.5-18.5	1800	15-17	1800
15-18	2000	14-16	2000

Although these outputs may be varied somewhat by adjustment of third brush should conditions require, the rates given here will give satisfaction in the average case. At no time should the maximum generator output exceed 20 amperes.

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Lamps.—Head lamps are 6-8 volts, 17 cp. Dash lamp is 6-8 volts, 2 cp. Tail lamp is 6-8 volts, 2 cp.

Circuit Breaker.—There is a vibrating type circuit breaker to take the place of fuses in the light circuits. It should take about 25 amperes to start this device vibrating, but once set vibrating, 3 to 5 amperes will cause it to continue operating.

Model Numbers.—Generator is No. 87. Starter is No. 86. Starting switch is No. 1965. Ignition coils are No. 2123. Distributor is No. 5156. Combination switch is No. 1105.

Plate No. 236

Moore

Model 30 (1917-18) Dyneto Starting and Lighting System Eisemann Magneto Ignition

Battery.—Battery is 6 volt, 80 ampere-hour. The negative (—) terminal is grounded.

Ignition.—Magneto breaker contacts should separate .014 inch to .018 inch. Should they become badly burned or pitted, affecting the ignition, resurface them with a fine, flat jeweler's file or a strip of worn No. 00 sand paper.

Timing.—Contacts should begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 2, 4, 3.

Spark Plug Gaps.—Spark plug gaps should be about .025 inch.

Oiling.—Put 2 or 3 drops of light machine oil in each of the magneto oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Starter.—Starter is connected to the engine through a Bendix drive. Cold engine, tight bearings, heavy oil or other obstructions, or damp, grounded or short circuited motor windings or commutator bars will cause low speed and excessive current during the cranking operation.

Oiling.—Put 4 or 5 drops of light engine oil on the felt wick of starter bearing oilers every month.

Generator.—Generator current regulation is by third brush system. Relay should close at 6 to 8 miles per hour. The maximum generator output of 11-13 amperes is reached at about 16 miles per hour. Clean relay contacts by drawing a piece of unglazed paper between them. If badly burned or pitted, resurface with a piece of worn No. 00 sand paper, drawing a piece of unglazed paper between them, to remove all grit, before again putting into service.

Oiling.—Put 3 or 4 drops of light engine oil in each of the bearing oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Lamps.—Head lamps are 6-8 volts, 20 cp. Tail lamp is 6-8 volts, 2 cp.

American Six

Model A (1917-18)

Westinghouse Starting and Lighting System Atwater-Kent Ignition

Battery.—Battery is 6 volt, 110 ampere-hour. The positive (+) terminal is grounded.

Ignition.—Breaker contacts should separate .010 inch to .012 inch. They are made of tungsten. They will operate properly even though quite irregular. Should they be badly burned or corroded, affecting the ignition, resurface them by drawing across a piece of fine emery cloth laid on a very flat surface, as on the bed of a drill press, finishing on a hard oil stone.

Timing.—Contacts should begin to separate when the piston entering power stroke is just over top dead center, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—Spark plug gaps should be about .023 inch.

Oiling.—Put several drops of light engine oil in the oil hole beside the shaft every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Starter.—Starter is connected to the engine through a Bendix drive. It should run at 1250 R. P. M., when delivering 2.5 pound-feet torque. It should develop 16 pound-feet lock torque, taking 525 amperes.

Oiling.—Put 4 or 5 drops of light engine oil in each of the starter oilers every month.

Generator.—Generator current regulation is by third brush system. The normal output should be 15-17 amperes at 7.5 volts, reached at 1100 to 1500 R. P. M. If operated freely as a motor, generator should take 3.5 to 5 amperes, at 6 volts. Greater current indicates damp, grounded or short circuited armature windings or commutator bars or tight bearings. Shunt field should take 1.5 to 2.4 amperes. Relay contacts should separate .013 inch to .018 inch. The air gap between the relay armature (moving member) and coil core should be .027 inch to .031 inch. Adjust relay by bending brass prongs. Charging current should be 1 to 5 amperes at closing and the discharge current .75 to 1.25 amperes at opening of relay contacts. Clean contacts by drawing a piece of unglazed paper between them. If badly burned or pitted, resurface them with a piece of well worn No. 00 sand paper, drawing a piece of unglazed paper between them, to remove all grit, before again putting into service.

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Lamps.—Head lamps are 6-8 volts, 15 cp. Dimmer lamps are 6-8 volts, 4 cp. Dash and tail lamps are in series. They are each 3-4 volts, 2 cp.

Fuse.—Fuse is 20 ampere.

Model Numbers.—Generator is Frame No. 760. Starter is Frame No. 711.

Plate No. 238

Metz Model G (1917-18) Westinghouse Starting and Lighting System Atwater-Kent Ignition

Battery.—Battery is 6 volt, 70 ampere-hour. The positive (+) terminal is grounded.

Ignition.—Breaker contacts should separate .006 inch. They are made of tungsten. They will operate properly even though quite rough. Should they become burned or corroded, affecting the ignition, remove and resurface them by drawing across a piece of fine emery cloth laid on a flat surface, as on the bed of a drill press, finishing on a hard oil stone.

Timing.—Contacts should begin to separate when the piston entering power stroke is on top dead center, spark control lever within one inch of the fully retarded position. See that breaker assembly is fully retarded when control lever is in the fully retarded position. Spark advance is controlled both automatically and by hand.

Firing Order.—The firing order is 1, 2, 4, 3.

Spark Plug Gaps.—Spark plug gaps should be about .023 inch.

Oiling.—Put 5 or 6 drops of light engine oil in oil hole at side of breaker (exposed when cover is removed). If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Starter.—Starter is connected to engine through a Bendix drive. It should develop 2 pound-feet torque when running at 1500 R. P. M. It should develop 11½ pound-feet lock torque, taking about 400 amperes.

Oiling.—Refill the oil wells under starter bearings every month.

Generator.—Generator current regulation is by third brush system. Relay should close at 8-10 and open at 6-8 M. P. H. The charging current immediately after relay closes should be 1 to 1.5 amperes. Relay should open when the discharge current reaches .75 to 1.25 amperes. Contacts should separate .013 inch to .018 inch. The air gap between relay armature (moving member) and coil core should be about 1/32 inch. Clean contacts by drawing a piece of unglazed paper between them. Should they become badly burned or pitted, resurface with a piece of well worn No. 00 sand paper, drawing a piece of soft paper between them to remove any grit, before again putting into service. Adjust by bending the brass prongs. The maximum generator output should be 14-17 amperes, reached at 1100 to 1500 R. P. M., of generator armature. This rate reduces to 7-11 amperes at 2300 to 2600 R. P. M. Shunt field should take 1.5 to 2.2 amperes. There is a 5 ampere fuse in the shunt field circuit.

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Lamps.—Head lamps are 6-8 volts, 15 cp. Dimmer lamps are 6-8 volts, 4 cp. Dash lamp is 6-8 volts, 2 cp. Tail lamp is 6-8 volts, 2 cp.

Fuses.—Fuse is 50 ampere.

Model Numbers.—Generator is Frame Number 760. Starter is Frame Number 318. Atwater-Kent breaker is type CA, standard coupling being used.

10.5 lb. ft.	Lock	425

Oiling.—Put several drops of light engine oil in each of the starter oilers every month.

Generator.—Generator charging current regulation is by reverse series field. Current taken by the lamps does not flow through the series field, hence has but little effect on the charging rate.

GENERATOR DATA, FRAME No. 202

Speed in R. P. M.	Total Output Charging and Lamp Current Amperes	Charging Current Lamps Out Amperes
400	2	1.0- 1.5
500	2-6	2.5- 3.0
750	10	6.0- 6.5
1000	13	8.5- 9.0
1250	15-16	9.5-10.0
1500	16-17	10.5-11.0
2000	18	11.0-12.0
2500	18-19	12.
3000	19	12.

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Lamps.—Head lamps are 6-8 volts, 15 cp. Dimmer lamps are 6-8 volts, 6 cp. Dash lamp is 6-8 volts, 2 cp. Tail lamp is 6-8 volts, 4 cp.

Plate No. 241

NATIONAL SERIES AD, 12 CYLINDER (1916) WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM SPLITDORF IGNITION

BATTERY.—Battery is 6 volt, 100 ampere-hour. The two-wire system is used.

IGNITION.—Magnetos breaker contacts separate .020 inch. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Fill the magneto oil cups every month. Apply one drop of oil to the breaker bar bearing. If the car is driven more than 1000 miles in a month, the oiling must be done every 1000 miles.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1R, 6L, 5R, 2L, 3R, 4L, 6R, 1L, 2R, 5L, 4R, 3L.

SPARK PLUG GAPS.—Spark plug gaps are .020 to .025 inch.

STARTER.—Frame No. 310. Starter is connected to the engine through a Bendix drive. Lock torque is 6 pound-feet, current being 375 amperes. Torque at 2100-2425 R.P.M. is 2 pound-feet, current being 160 amperes at 5.25 volts. Running freely, starter takes 40 amperes at 5.25 volts, armature revolving at 8000 R.P.M. Pressure of brushes on the commutator is $\frac{3}{4}$ to $1\frac{1}{4}$ pounds.

OILING.—Put 4 or 5 drops of light engine oil in each of the starter oilers every month.

GENERATOR.—Frame No. 450. Generator current regulation is by the third brush method. Maximum charging rate is 14-15 amperes at 6.75 to 7 volts, reached at 1100-1300 R.P.M. of the armature or 20 miles per hour.

Amperes	Generator Data	R.P.M.
0		450
8		660
14-15		1100-1300
8		2000

Amperes	Hot Test R.P.M.	Volts
11-13.5	1100-1400	6.75-7.0

Charging rate is varied by adjustment of the third brush setting.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay is combined with the starting switch. Relay closes at 450-500 R.P.M. of armature or 8 miles per hour and opens at 400-450 R.P.M. of the armature or 6 miles per hour. To adjust relay regulate spring tension and air gap so that the contacts close when the voltage of the generator reaches 7.8 to 8 volts, battery disconnected and opens with a discharge current of 0 to 1.75 amperes from the battery. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 15 cp. Dimmer lamps are 6-8 volt, 6 cp. Dash and tail lamps are 6-8 volt, 4 c.p.

Plate No. 242

Elgin

Model 6-E-16 (1916)

Dyneto Starting and Lighting System

Delco Ignition

Battery.—Battery is 6 volt, 80 ampere-hour. The negative (—) terminal is grounded.

Ignition.—Breaker contacts should separate .018 inch to .020 inch. They are made of tungsten. They will operate properly even though quite rough. Should they become badly worn, affecting the ignition, the inner breaker mechanism should be renewed as directed on Page 50. In an emergency, contacts may be resurfaced enough to give service for 300 or 400 miles by drawing a piece of fine emery cloth between them.

Timing.—Contacts should begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—Spark plug gaps should be about .027 inch.

Oiling.—Put 3 or 4 drops of light engine oil in the top distributor bearing every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Starter.—Starter is connected to the engine through a Bendix drive. When free to operate, motor should take 40-50 amperes, armature revolving at about 3000 R. P. M. Greater speed indicates damp, grounded or short circuited field coils. Lower speed and high current indicates damp, grounded or short circuited armature coils or commutator bars. Movement of the ammeter needle at low speed indicates grounded or short circuited armature coils or commutator bars.

STARTER DATA, TYPE UA

Torque	R. P. M.	Amperes	Volts
2.5 lb. ft.	1350	160	5.2
5.0 lb. ft.	650	280	4.7
7.5 lb. ft.	270	380	4.4
10.0 lb. ft.	Lock	480	4.0

Oiling.—Saturate the felt disk at the commutator end and the felt wick at the driving end with light engine or machine oil every month.

Generator.—Generator current regulation is by a vibrating type regulator. Relay is combined with the regulator. Relay should close at 6-8 miles per hour. Maximum generator output should be reached at 10-12 miles per hour. The maximum output should be 10-12 amperes. Clean relay and regulator contacts by drawing a piece of unglazed paper between them. If badly burned or pitted, resurface them with a piece of well worn No. 00 sand paper, drawing a piece of unglazed paper between them, to remove all grit, before again putting into service. Increasing the spring tension on regulator armature (moving member) will increase the output. Decreasing the spring tension will decrease the output. Generator output will decrease slightly as the speed increases above that necessary to produce the maximum.

Oiling.—Saturate the felt disk at the commutator end and the felt wick at the driving end with light engine or machine oil every month. If car is driven more than 1000 miles in a month, these attentions must be given every 1000 miles.

Lamps.—Head lamps are 6-8 volts, 20 cp. Dash lamp is 6-8 volts, 2 cp. Tail lamp is 6-8 volts, 2 cp.

Plate No. 243

Mitchell

Model C-42 (1916-17-18) Westinghouse Starting and Lighting System Connecticut or Remy Ignition

Battery.—Battery is 6 volt, 100 ampere-hour. The positive (+) terminal is grounded.

Ignition.—Connecticut ignition was used on the 1916-17 cars and Remy on the 1918. On cars using the Connecticut system, contacts should separate .018 inch to .022 inch. They are made of tungsten. They will operate properly even though quite rough. Should they become badly worn, affecting the ignition, the inner breaker mechanism should be renewed as directed on Page 50. In an emergency, contacts may be resurfaced enough to give service for 300 or 400 miles by drawing a piece of fine emery cloth between them. On cars equipped with Remy ignition, contacts should separate .018 inch to .023 inch. Should they be burned or pitted, affecting the ignition, resurface them with a fine, flat jeweler's file or a strip of worn No. 00 sand paper.

Timing.—Contacts should begin to separate when the piston entering power stroke is on top dead center, spark control lever about $1\frac{1}{2}$ inches from the fully retarded position. (First see that breaker assembly is fully retarded when lever is in the fully retarded position).

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—Spark plug gaps should be .020 inch to .025 inch with Connecticut ignition and .025 inch to .030 inch with Remy ignition.

Oiling.—On cars using Connecticut ignition, refill the cup under the breaker head with pure vaseline and turn down every month. If car is driven more than 1000 miles in a month, this must be done every 1000 miles. Do not put grease or oil in the cup. On cars using Remy ignition, refill the cup under the distributor head with soft cup grease and turn down two turns every two weeks. At the same time put a small amount of vaseline on the fiber bumper of the contact arm, using a toothpick. If the car is driven more than 500 miles in two weeks, these attentions should be given every 500 miles.

Starter.—Starter is connected to the engine through a Bendix drive. Cold engine, heavy oil, tight bearings or other obstructions will cause abnormally high current and reduce the speed during the cranking operation. Starter should run at 1200 R. P. M., when delivering 2.5 pound-feet torque. It should develop 12.5 pound-feet lock torque, taking 400 amperes.

Oiling.—Put 5 or 6 drops of light engine oil in each of the starter oilers every month. Do not oil the Bendix drive. Should the pinion stick, clean shaft with gasoline.

Generator.—Generator voltage regulation is by a vibrating regulator. Relay is combined with the regulator. The charging current should be about 1.5 amperes at closing and the discharge current 1.25 amperes at opening of relay contacts. The air gap between relay armature (moving member) and coil core should be .027 inch to .030 inch. Contacts should separate .013 inch to .017 inch. Adjust by bending the brass prongs. Clean relay and regulator contacts by drawing a piece of unglazed paper between them. If badly burned or pitted, resurface them with a piece of well worn No. 00 sand paper, drawing a piece of unglazed paper between them, to remove all grit, before again putting into service. Generator output should be 14 amperes at 7.5 volts.

Oiling.—Put 4 or 5 drops of light engine oil in each of the generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Lamps.—Head lamps are 6-8 volts, 15 cp. Dash lamp is 6-8 volts, 2 cp. Tail lamp is 6-8 volts, 2 cp.

Fuses.—Lighting fuses are 20 ampere.

Model Numbers.—Generator is Frame No. 400. Starter is Frame No. 700.

Plate No. 244

Mitchell

Model D-40 (1917-18)

Splitdorf Starting and Lighting System Connecticut Ignition

Battery.—Battery is 6 volt, 80 ampere-hour. The positive (+) terminal is grounded.

Ignition.—Breaker contacts should separate about .020 inch. They are made of tungsten. They will operate properly even though quite rough. Should they become badly worn, affecting the ignition, the inner breaker mechanism should be renewed as directed on Page 50. In an emergency, contacts may be resurfaced enough to give service for 300 to 400 miles by drawing a piece of fine emery cloth between them.

Timing.—Contacts should begin to separate when piston entering power stroke is on top dead center, spark control lever about 1 inch from the fully retarded position. (First see that breaker assembly is fully retarded when the lever is in the fully retarded position).

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—Spark plug gaps should be about .027 inch.

Oiling.—Refill the cup under the breaker head with pure vaseline and turn down every month. If car is driven more than 1000 miles in a month, this must be done every 1000 miles. Do not put grease or oil in the cup.

Starter.—Starter is connected to engine through a Bendix drive. Cold engine, tight bearings, heavy oil or other obstructions or grounded, damp or short circuited field coils, armature windings or commutator bars will cause abnormally high current and low speed during the cranking operation.

Oiling.—Put several drops of light engine oil in each of the starter oilers every month.

Generator.—Generator voltage regulation is by a vibrating regulator. Relay is combined with the regulator. Clean relay and regulator contacts by drawing a piece of unglazed paper between them. If badly burned or pitted, resurface with a piece of well worn No. 00 sand paper, drawing a piece of unglazed paper between them, to remove all grit, before again putting into service. Should the charging rate continue to increase with the speed, regulator contacts are dirty or sticking. Generator output may be increased by increasing the spring tension on the armature (moving member). Be sure to tighten lock nuts after adjusting regulator or relay.

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Lamps.—Head lamps are 6-8 volts, 15 cp. Dash lamp is 6-8 volts, 2 cp. Tail lamp is 6-8 volts, 2 cp.

Fuse.—Fuse is 20 ampere.

Kissel-Kar

Westinghouse Lighting System
Eisemann Magneto Ignition

Plate No. 245

KISSEL-KAR

MODEL 6-42 (1915-16-17)

**WESTINGHOUSE GENERATING SYSTEM. KISSEL STARTER
EISEMANN MAGNETO IGNITION**

BATTERY.—Willard, Type SLB-610-AB-30, 6 volt, 100 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Magneto breaker contacts separate .018 to .022 inch. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Put 2 or 3 drops of light engine oil in the magneto oilers every month. If the car is driven more than 1000 miles in a month, the oiling must be done every 1000 miles.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .027 inch.

STARTER.—Kissel. Starter is connected to the engine through a Bendix drive. Starter cranks the engine at 100 R.P.M.

OILING.—Put 4 or 5 drops of light engine oil in the starter oilers every month.

GENERATOR.—Frame No. 208 or 400-R. Current regulation of Frame 208 is by reverse series field. Voltage regulation of Frame 400-R is by vibrating regulator.

Generator Data. Frame 208

Amperes	R.P.M.
0	425
8	650
11-15	1500

Shunt field current is 1.5-2.5 amperes at 6-6.3 volts. Operating freely as a motor, generator takes 2.5-3.5 amperes at 6-6.3 volts. The current taken by the lamps does not pass through the reverse series field, hence has but little effect on the charging rate.

OILING.—Put 4 or 5 drops of light engine oil in the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted in the generator frame. Relay closes at 425-475 R.P.M. of the armature or 8 miles per hour and opens at 375-425 R.P.M. of the armature or 6 per hour. Adjust relay to open with a discharge current of 0-2 amperes and close when the voltage of the generator reaches 7 to 7.5 volts, battery disconnected. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 12-18 cp. Dash lamp is 6-8 volt, 2 cp. Tail lamp is 6-8 volt, 2 cp.

FUSES.—Fuses are 20 ampere.

Crane-Simplex

Bosch-Rushmore Starting and Lighting System.

Bosch Dual Ignition

Plate No. 246

Battery —Battery is 6 volt, 150 ampere-hour. The positive (+) terminal is grounded from cable leading to the starting motor.

Ignition.—The Bosch type ZR magneto is used. This magneto is treated on Page 186. Breaker contacts should separate .014 inch to .016 inch. Should they become badly burned or pitted, affecting the ignition, resurface then with a fine, flat jeweler's file or a strip of worn No. 00 sand paper.

Timing.—Contacts should begin to separate when the piston entering power stroke is on top dead center, spark control lever about 1 inch from the fully retarded position. (First see that breaker assembly is fully retarded when lever is in the fully retarded position).

Firing Order.—The firing order of the four cylinder cars is 1, 3, 4, 2. The firing order of the six cylinder cars is 1, 4, 2, 6, 3, 5.

Spark Plug Gaps.—Spark plug gaps should be about .018 inch.

Oiling.—Put 2 or 3 drops of light machine oil in each of the magneto oilers every two weeks. At the same time put a very small amount of vaseline on the fiber bumper of the contact arm, using a toothpick. If car is driven more than 500 miles in two weeks these attentions must be given every 500 miles.

Starter.—The starter pinion is meshed with the flywheel gear by moving of the armature. The armature is constructed so that it has considerable end play. A spring at the commutator end normally holds the armature in such a position that the gears are demeshed. When the starting switch is moved so as to connect the first and second contacts a large current is allowed to flow through the motor field and a small current through the armature. This causes a strong attraction between the armature and field with the result that the armature is drawn further into the frame, meshing the gears. The current through the armature causes it to turn slowly, facilitating meshing of the gears. When the engine starts, the current taken by the starter decreases sufficiently to allow the spring to force the armature out, demeshing the gears.

Oiling.—Put 3 or 4 drops of light engine oil in each of the starter oilers every two weeks.

Generator.—Generator current regulation is by reverse series field and a regulating resistance. This regulating resistance is connected in shunt with the reverse series field. When cold, this unit has a very small resistance, but when hot it has a greatly increased resistance. When cold, it forms practically a short circuit across the series field terminals, allowing but little current to flow through the series field. As the current through the resistance increases, the temperature and resistance increases, causing more current to flow through the reverse winding, reducing the output. As the resistance of the regulating coil increases in proportion to the current through it, the current is held practically constant at speeds above that necessary to produce the maximum output. The output is changed by changing the regulating resistance unit.

Oiling.—Put several drops of light engine oil in each of the generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Lamps.—Head lamps are 6-8 volts, 39 cp., on 1917-18 cars and 6-8 volts, 27 cp., on previous cars. Dimmer lamps are 6-8 volts, 4-7 cp. Dash and tail lamps are in series. They are each 3-4 volts, 2 cp. Step lamp and trouble lamp is 6-8 volts, 2 cp. Dome lamp is 6-8 volts, 4-6 cp.

Fuses.—Main fuse is 250 volts, 30 ampere on the 1915-16 cars and 250 volts, 20 ampere on the 1917 cars. Other fuses are 10 ampere.

38 H. P. Shaft Drive

Plate No. 248

Standard

1915 (4 Cylinder Model)

Westinghouse Starting and Lighting System

Westinghouse Ignition

Battery.—Battery is 6 volt, 85 ampere-hour. The positive (+) terminal is grounded.

Ignition.—The timer, ignition coil and distributor are all contained in one unit. Contact should separate .006 in .008 inch. Should they be burned or pitted, resurface them with a very fine, flat jeweler's file. There is a ballast resistor on the ignition switch. If it is necessary to operate car with ballast resistor defective, a 5 ampere fuse may be substituted temporarily. The ballast must be replaced as soon as possible, as operation of the car without it will cause the contacts to corrode.

Oiling.—Put several drops of light engine oil in the oiler at the side of ignitor every month. If car is driven more than 1000 miles a month, the oiling must be done every 1000 miles.

Timing.—Breaker contacts should begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position. The contacts are ready to separate when the mark on the distributor rotor is directly opposite the V notch on the rim of the case.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plug Gap.—Spark plug gap should be about .025 inch.

Starter.—Starter is connected to the engine by a magnetically shifted pinion. This device is fully described on Page 201.

STARTER DATA (FRAME No. 310)

Torque	R. P. M.	Amperes
0.5 ft. lb.	4500	80
1. ft. lb.	3200	120
2. ft. lb.	2000	175
2.5 ft. lb.	1700	200
3. ft. lb.	1400	220
3.5 ft. lb.	1200	240
4. ft. lb.	800	255
5. ft. lb.	400	290
5.8 ft. lb.	Lock	320

Care.—Contacts of main switch should be separated 1/8 inch when switch is in the "Off" position. If contacts are burned or pitted, they may be resurfaced with a piece of fine emery cloth.

Oiling.—Put 4 or 5 drops of light engine oil in each of the motor oilers every month.

Generator.—Generator charging current regulation is by reverse series field.

Output.—Current taken by the lamps does not flow through series field so generator output is greater when lamps are burning than when only charging current is being supplied, as shown in table below.

TABLE OF GENERATOR OUTPUT (FRAME No. 203)

Speed R. P. M.	Total Output Amperes.	Charging Rate, No Lamps Amperes
400	2-0	1.0-1.5
500	5-6	2.0-5.3
750	10-0	6.0-6.5
1000	13-0	8.5-9.0
1250	15-16	9.5-10.0
1500	16-17	10.5-11.0
2000	18-0	11.0-12.0
2500	18-19	12.0
3000	19-0	12.0

Oiling.—Put 4 or 5 drops of light engine oil in each of the generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Lamps.—Head lamps are 6-8 volts, 20 cp. Dimmer lamps are 6-8 volts, 5 cp. Dash lamp is 6-8 volts, 2 cp. Tail lamp is 6-8 volts, 2 cp.

Fuses.—Lighting fuses are 20 ampere.

Plate No. 249

STANDARD MODEL "8" (1916) WESTINGHOUSE STARTING AND LIGHTING SYSTEM WESTINGHOUSE IGNITION

BATTERY.—Battery is 6 volt, 85 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Breaker contacts separate .008 inch. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper. Adjust the distributor brush springs so that the brushes extend 1/4 inch from their holders when the distributor cap is removed, retaining them, however, so that they do not fall out. Brushes must move freely in their holders. See that the brushes on the top and bottom of the rotor are in place when installing the rotor.

Oiling.—Put 2 or 3 drops of light engine oil in the oiler at the side of the ignition unit every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Timing.—Breaker contacts begin to separate when the top dead center mark on the flywheel is two inches past the indicator, spark control lever and breaker assembly in the fully retarded position.

Ballast Resistor.—There is a ballast resistor in the ignition switch. In case it is necessary to operate the car with the ballast defective, a 5 ampere fuse may be used temporarily, but the ballast must be replaced as soon as possible, as continued operation without it will result in serious burning of the timer contacts.

Firing Order.—The firing order is 1R, 1L, 3R, 3L, 4R, 4L, 2R, 2L.

Spark Plug Gaps.—Spark plug gaps are .023 inch.

STARTER.—Frame 700. Starter is connected to the engine through a Bendix drive.

Starter Data

Torque	R.P.M.	Amperes	Volts
2.5 lb. ft.	1250	130	4
12.5 lb. ft.	Lock	400	

Brush tension is 1 to 1.5 pounds.

Oiling.—Put 4 or 5 drops of light engine oil in each of the starter oilers every month.

GENERATOR.—Frame 400. Generator voltage regulation is by a vibrating regulator. Relay is combined with the regulator. The charging current is 1 to 1.5 amperes at closing and the discharge current is .75 to 1.25 amperes at opening of the relay contacts. The air gap between the relay armature (moving member) and the coil core is .027 to .030 inch. Contacts separate .013 inch. Adjust by bending brass prongs. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface the tungsten contacts on an oil stone, and the silver contacts with a scraper. Generator should deliver 15 amperes at 6.8 volts, which is reached at 1200 R.P.M. of the generator armature.

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

LAMPS.—Head lamps are 6-8 volts, 20 cp. Dimmer lamps are 6-8 volts, 5 cp. Dash lamp is 6-8 volts, 2 cp. Tail lamp is 6-8 volts, 2 cp.

FUSES.—Fuses are 20 ampere.

STANDARD MODEL E (1916-17) WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM WESTINGHOUSE IGNITION

Battery.—Battery is 6 volt, 85 ampere-hour. The positive (+) terminal is grounded.

Ignition.—Breaker contacts should separate .020 inch to .025 inch. Should they become badly burned or pitted, affecting the ignition, resurface them with a fine, flat jeweler's file ~ a strip of worn No. 00 sand paper.

Timing.—Contacts should begin to separate when the top dead center mark on the fly-wheel is 2 inches past the indicator, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1R, 1L, 3R, 3L, 4R, 4L, 2R, 2L.

Spark Plug Gaps.—Spark plug gaps should be .025 inch to .030 inch.

Oiling.—Put 2 or 3 drops of light engine oil in each of the magneto oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Starter.—Starter is connected to the engine through a Bendix drive. It should run at 1200 R. P. M., when delivering 2.5 pound-feet torque. It should develop 12.5 pound-feet lock torque, taking about 400 amperes. Low speed and high current indicates damp, grounded, or short circuited motor windings or commutator bars.

Oiling.—Put 4 or 5 drops of light engine oil in each of the starter oilers every month.

Generator.—Generator voltage regulation is by a vibrating regulator. Relay is combined with the regulator. The charging current should be about 1 to 1.5 amperes at closing and the discharge current 1.25 amperes at opening of relay contacts. The air gap between relay armature (moving member) and coil core should be .027 inch to .030 inch. Contacts should separate .013 inch to .017 inch. Adjust by bending the brass prongs. Clean relay and regulator contacts by drawing a piece of unglazed paper between them. If badly burned or pitted, resurface them with a piece of well worn No. 00 sand paper, drawing a piece of unglazed paper between them, to remove all grit, before again putting into service. Generator should deliver 15-17 amperes at 7.2 volts.

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Lamps.—Head lamps are 6-8 volts, 20 cp. Dimmer lamps are 6-8 volts, 5 cp. Dash and tail lamps are in series. They are each 3-4 volts, 2 cp.

Fuses.—Fuses are 20 ampere.

Model F (1917)

Splitdorf-Apelco Starting and Lighting System Splitdorf Magneto Ignition

Battery.—Battery is 6 volt, 100 ampere-hour. The positive (+) terminal is grounded.

Ignition.—Breaker contacts should open .020 inch to .025 inch. Clean them with gasoline whenever necessary. Should they be burned or pitted, affecting the ignition, resurface with a fine, flat jeweler's file on a strip of worn No. 00 sand paper.

Timing.—Contacts should begin to separate when the top dead center mark on the flywheel is two inches past the indicator, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1R, 1L, 3R, 3L, 4R, 4L, 2R, 2L.

Spark Plug Gaps.—Spark plug gaps should be .027 inch to .030 inch.

Oiling.—Put several drops of light machine oil in each of the magneto oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Starter.—Starter is connected to the engine through a Bendix drive.

Oiling.—Put 5 or 6 drops of light engine oil in each of the motor oilers every two weeks. Do not oil the Bendix drive. Should the pinion stick, clean shaft with gasoline.

Generator.—Generator voltage regulation is by a vibrating-type regulator mounted on the generator. Relay is combined with regulator. Relay contacts should close at about 8 miles per hour. The maximum generator voltage should be reached at 12-14 miles per hour. Clean relay and regulator contacts by drawing a piece of soft paper between them. Should they be burned or pitted, resurface them with a piece of worn No. 00 sand paper. Increasing the spring tension on regulator armature (moving member) will increase the output. Decreasing the spring tension will decrease the output. The generator pressure should not exceed $7\frac{1}{2}$ volts. Should the voltage continue to rise after the desired rate is reached, regulator contacts are probably sticking.

Oiling.—Put 5 or 6 drops of light engine oil in each of generator oilers every two weeks. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.

Lamps.—Head lamps are 6-8 volts, 18 cp. Dimmer lamps are 6-8 volts, 4 cp. Dash lamp is 6-8 volts, 2 cp. Tail lamp is 6-8 volts, 2 cp.

Fuses.—Lighting fuses are 20 ampere.

Plate No. 252

DAVIS MODELS 38A, 38B AND 38C (1915)

WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM WESTINGHOUSE IGNITION

BATTERY.—Battery is 6 volt, 85 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—**Vertical Type.** Breaker contacts separate .006 inch. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper. Adjust the distributor brush springs so that the brushes extend $\frac{1}{4}$ inch from their holders when the distributor cap is removed, retaining them, however so that they do not fall out. The brushes must move freely in their holders. See that the brushes on the top and bottom of the rotor are in place when installing the rotor.

OILING.—Put 3 or 4 drops of light engine oil in the oiler at the side of the ignition unit every month. If the car is driven more than 1000 miles in a month, the oiling must be done every 1000 miles.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position. The breaker contacts are just beginning to separate when the end of the distributor rotor is directly opposite the V notch on the rim of the case.

BALLAST RESISTOR.—There is a ballast resistor in the ignition switch. In case it is necessary to operate the car with the ballast defective, a 5 ampere fuse may be used temporarily, but the ballast must be replaced as soon as possible, as continued operation without it will result in serious burning of the contacts.

FIRING ORDER.—The firing order is 1, 3, 4, 2.

comes fully charged. Maximum current output is reached at 1400 R.P.M. of armature.

SPARK PLUG GAPS.—Spark plug gaps are .025 inch.

STARTER.—**Model No. 318.** Starter is connected to the engine through a Bendix drive. Torque at 1400 R.P.M. is 2 pound-feet at 125 amperes. The lock torque is 11.5 pound-feet, current being 400 amperes.

OILING.—Refill starter oil wells with light engine oil every three months.

GENERATOR.—**Frame 400-R.** Generator voltage regulation is by vibrating regulator. Maximum charging rate is 15 amperes, decreasing to 4-6 amperes as battery becomes full or 20 miles per hour.

OILING.—Put 4 or 5 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY-REGULATOR.—Relay and regulator are combined into one unit. Relay closes at 550-600 R.P.M. of armature or 8-10 miles per hour, and opens at 500-550 R.P.M. of armature or 6-8 miles per hour. Charging current is .5 to 1 ampere at closing and the discharge current 1-3 amperes at opening of relay contacts. Relay is adjusted by bending the two brass prongs at the end of the moving member. To adjust regulator connect a voltmeter between the "A" generator terminal and ground. Operate the generator at 1400 R.P.M., charging a battery of 1.250 solution. Then adjust the regulator spring tension by means of the thumb screw, until the voltmeter indicates 6.8 volts and 15 amperes. Air gap between regulator armature (moving member) and coil core is .045 to .055 inch. Air gap between relay armature and coil core is .055 to .060 inch. Clean relay and regulator contacts by drawing unglazed paper between them. If badly burned or pitted resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 15 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp.

Batt ry.—Battery is 6 volt, 130 ampere-hour. The positive (+) terminal is grounded.

Adjustment.—When the engine is not running and one of the weights is depressing the fiber bumper, the air gap between the bumper lever and the stop should be $\frac{3}{64}$ of an inch. This distance must be correct before the contact clearance is adjusted. With this distance correct, the contacts should be separated .005 to .008 inch when the contact arm or bumper lever is resting on the stop. Interrupter weights should turn freely on their supporting pins and their surfaces should clear the back of the spring support by .01 inch. After adjustments, see that both weights depress the contact lever sufficiently that positive connection between the contacts is assured when engine is cranked very slowly by hand. If they do not, there will be a tendency of missing at low speed, especially if contacts are worn or otherwise not in first-class condition. When the weights are in the inner (or retarded) position, the spring should just touch the fiber covered pins without exerting any appreciable pressure on them. If it is necessary to adjust these springs, always do so by bending the supporting arms, not the springs themselves. Distributor brushes should move freely in their holders. The springs should exert just enough pressure on them to force their ends $\frac{1}{2}$ inch from holder. They should be retained by the springs so that they do not tend to fall out. The gears should be so meshed that the mark on the edge of the distributor (large) gear lines up with the tooth on the small gear (on the armature shaft) which is slightly beveled. The two screws holding the distributor plate in place make connection between the ignition coil and the generator. They must both be screwed firmly in place to complete the coil circuit.

Timing.—To time generator to engine, first turn engine until the piston of No. 1 cylinder is on top dead center, both valves closed, then remove distributor plate and turn generator armature back until the mark on the distributor brush holder lines up with the mark on the end bracket. Connect to engine in this position and connect spark plug gap to the distributor according to the firing order. Should timer contacts become badly burned or pitted, affecting the ignition, resurface them with a fine, flat jeweler's file or a strip of worn No. 00 sand paper.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—Spark plug gaps should be about .023 inch.

Starter.—Starter is connected to the engine through a Bendix drive. Cold engine, heavy oil, tight bearings or other obstructions or damp grounded or short circuited armature coils or commutator bars will cause excessive current and low speed during the cranking operation.

Oiling.—Put several drops of light engine or machine oil in each of the starter oilers every month.

Generator.—Generator charging current regulation is by reverse series field. Current taken by the lamps does not flow through the series field so has but little effect on the charging rate.

GENERATOR DATA, FRAME No. 240			
Speed in R. P. M.	Charging and Lamp Current.	Total Output Amperes	Charging Current Lamps Out. Amperes
400	2		1.0- 1.5
500	5- 6		2.5- 3.0
750	10		6.0- 6.5
1000	13		8.5- 9.0
1250	15-16		9.5-10.0
1500	16-17		10.5-11.0
2000	18		11.0-12.0
3000	19		12.

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Lamps.—Head lamps are 6-8 volts, 24 cp. Dash lamp is 6-8 volts, 4 cp. Tail lamp is 6-8 volts, 2 cp.

Plate No. 253

McFarlan

1916

Westinghouse Starting and Lighting System Westinghouse Ignition

Battery.—Battery is 6 volt, 130 ampere-hour. The positive (+) terminal is grounded.

Ignition.—Breaker contacts should separate .006 inch to .008 inch. Should they become burned or pitted, affecting the ignition, resurface them with a fine, flat jeweler's file. The springs should exert just enough pressure on the distributor brushes to force them $\frac{1}{4}$ inch past the top of the holder when the distributor cap is removed, but should retain them firmly so that they do not tend to fall out. Brushes must move freely in their holders. Be sure that both brushes are in place when replacing the rotor. (There is a brush on both the top and bottom side of the rotor).

Timing.—Contacts should begin to separate when the piston entering power stroke is on top dead center, spark control lever within 1 inch of the fully retarded position. (First see that breaker assembly is fully retarded when lever is in the fully retarded position).

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—Spark plug gaps should be about .023 inch.

Ballast Resistor.—There is a ballast resistor in the ignition switch. A fuse must not be permanently substituted for this resistor. In case it is necessary to operate the car with the ballast resistor defective, a 5 ampere fuse may be used temporarily, but the ballast must be replaced as soon as possible, as continued operation without it will result in serious burning of the timer contacts.

Oiling.—Put 3 or 4 drops of light machine oil in the oiler at the side of breaker assembly every month. If car is driven more than 1000 miles in a month, the oiling must be done every 1000 miles.

Starter.—Starter is connected to the engine through a Bendix drive. Starter Frame No. 750 should run at 1050 R. P. M., when delivering 3.5 pound-feet torque. It should develop 17.5 pound-feet lock torque, taking about 500 amperes. Generator Frame No. 775 should run at 1100 R. P. M., when delivering 3.5 pound-feet torque. It should deliver 22.5 pound-feet lock torque, taking about 500 amperes.

Oiling.—Put 4 or 5 drops of light engine oil in each of the starter oilers every month.

Generator.—Generator voltage regulation is by a vibrating regulator. Relay is combined with the regulator. The charging current should be about 1.5 amperes at closing and the discharge current 1.25 amperes at opening of relay contacts. The air gap between relay armature (moving member) and coil core should be .027 inch to .030 inch. Contacts should separate .013 inch to .017 inch. Adjust by bending brass prongs. Clean relay and regulator contacts by drawing a piece of unglazed paper between them. If badly burned or pitted, resurface with a piece of well worn No. 00 sand paper, drawing a piece of unglazed paper between them, to remove all grit, before again putting into service. Generator should deliver 14 amperes at 7.5 volts.

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Lamps.—Head lamps are 6-8 volts, 24 cp. Dimmer lamps are 6-8 volts, 4 cp. Dash lamp is 6-8 volts, 2 cp. Tail lamp is 6-8 volts, 2 cp.

McFARLAN
1917
WESTINGHOUSE STARTER & GENERATOR
BOSCH IGNITION

Plate No. 255

McFARLAN MODEL 127 (1917). SERIAL NOS. 10,000 TO 11,000 WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM BOSCH MAGNETO IGNITION

BATTERY.—Battery is 6 volt, 130 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Magneto breaker contacts separate .014 to .016 inch. When the condition of the contacts affects the ignition, resurface with a fine jeweler's file or worn No. 00 sandpaper.

OILING.—Put 2 or 3 drops of light machine oil in the magneto oilers every two weeks. Put a small amount of vaseline on the fiber bumper of the contact arm, applying with a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever one inch from the fully retarded position. (First see that the breaker assembly is fully retarded when the control lever is in the fully retarded position.)

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .018 to .022 inch.

STARTER.—Frame No. 775. Starter is connected to the engine through a magnetically shifted pinion. The starting switch is also of the magnetic type, controlled by a push button on the dash. The lock torque developed by the starter is 22 pound-feet, current being 485 amperes at 3.9 volts. Torque at 1000 R.P.M. is 3½ pound-feet, current being 135 amperes at 5.5 volts. Running freely, starter takes 36 amperes at 6.25 volts, armature revolving at 4800 R.P.M. Pressure or brushes on the commutator is 1 to 1½ pounds. The pinion must be pulled into mesh by a current of 125 amperes, and must not be held in by 36 amperes.

OILING.—Put 5 or 6 drops of light engine oil in the starter oilers every month.

GENERATOR.—Frame 400-R. Generator voltage regulation is by vibrating regulator. Maximum charging rate is 15 amperes, decreasing as the battery becomes charged. Charging rate is 12 amperes at 7 volts, when generator is driven at 1400 R.P.M., charging a battery of 1.250 solution.

OILERS.—Put 4 or 5 drops of light engine oil in the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY-REGULATOR.—Relay and regulator are combined into one unit. Relay closes at 575-600 R.P.M. of the armature or 8-10 miles per hour and opens at 550-575 R.P.M. of the armature or 6-8 miles per hour. Adjust relay by bending the two brass prongs at the end of the moving member so that the contacts open when the discharge current from the battery is 1-3 amperes, and close when the voltage of the generator reaches 6.6 to 7 volts, battery disconnected. To adjust the regulator, connect a voltmeter between the "A" generator terminal and ground. Operate the generator at 1400 R.P.M., charging a battery of 1.250 solution. Then adjust the regulator spring tension by means of the thumb screw, until the voltmeter indicates 7 volts. Air gap between moving member and coil core is .045 to .055 inch. Air gap between relay armature and coil core is .055 to .060 inch. Clean relay and regulator contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 27 cp. Dimmer lamps are 6-8 volt, 5 cp. Dash and tail lamps are 6-8 volt, 2 cp.

FUSES.—Small fuses are 10 ampere. Large fuses are 30 ampere.

Plate No. 256

MARMON MODEL 41 (1915)

BOSCH-RUSHMORE STARTING AND LIGHTING SYSTEM BOSCH MAGNETO IGNITION

BATTERY.—Battery is 12 volt, 60 ampere-hour. The positive (+) terminal is grounded through a fuse leading from the starting cable.

IGNITION.—Magneto breaker contacts should separate .014 inch to .016 inch. Should they become badly burned or pitted, affecting the ignition, resurface them with a very fine, flat jeweler's file or a strip of worn No. 00 sandpaper.

TIMING.—Contacts should begin to separate when the top dead center mark on the fly-wheel is at the indicator, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps should be about .018 inch.

OILING.—Put 2 or 3 drops of light machine oil in each of the magneto oilers every two weeks. At the same time put a very small amount of vaseline on the fiber bumper of the contact arm, applying with a toothpick. If car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

STARTER.—The starter pinion is meshed with the flywheel gear by movement of the armature. The armature is constructed so that it has considerable end play. A spring at the commutator end normally holds the armature in such a position that the gears are demeshed. When the starting switch is moved so as to connect the first and second contacts, a large current is allowed to flow through the motor field and a small current through the armature. This causes a strong attraction between the armature and field, with the result that the armature is drawn further into the frame, meshing the gears. The current through the armature causes it to turn slowly, facilitating meshing of the gears. When the engine starts the current taken by the starter decreases sufficiently to allow the spring to force the armature out, demeshing the gears.

OILING.—Put 3 or 4 drops of light engine oil in each of the starter oilers every two weeks.

GENERATOR.—Type DS-X. Generator voltage regulation is by a carbon-resistance regulator. Maximum charging rate is 8-10 amperes, reached at 20 miles per hour.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY-REGULATOR.—Relay and regulator are mounted in the dash unit. Relay closes at 8-10 and opens at 6-8 miles per hour. To adjust regulator, turn the tapered plug. Screwing the plug in increases the generator voltage, and screwing it out decreases the voltage. Relay is adjusted by means of a hexagon-headed nut in the center of spring at the bottom of the relay. Tighten this nut to raise the cut-in voltage, and loosen it to lower the cut-in voltage. When the contacts are closed the air gap between the moving member and the stationary part is 1/64 inch. To make this adjustment, loosen the hexagon nut and screw the contact screw in or out, after which the jam nut must be tightened again.

LAMPS.—Head lamps are 12-16 volt, 24 cp. Side lamps are 12-16 volt, 4 cp. Dash lamp is 12-16 volt, 4 cp. Tail lamp is 12-16 volt, 4 cp.

FUSE.—Fuse is 20 ampere.

Enger

Twelve Cylinder (1916-17) Westinghouse Starting and Lighting System. Remy Ignition

Battery.—Battery is 6 volts, 80 ampere-hour. The positive (+) terminal is grounded.

Ignition.—Breaker contacts should open .020 inch to .025 inch. Should they become badly burned or pitted, affecting the ignition, resurface them with a fine, flat jeweler's file or a piece of worn No. 00 sand paper.

Timing.—Contacts should begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position. There are two sets of contacts operated by a six-sided cam. These contacts open alternately but if one set is closed when the other opens, the circuit will not be broken, the result being no spark produced at the plugs. The breaker must be so set that the set of contacts which are separated remain so until the other pair is separated.

Firing Order.—The firing order is 1R, 1L, 5R, 5L, 3R, 3L, 6R, 6L, 2R, 2L, 4R, 4L.

Spark Plug Gaps.—Spark plug gaps should be about .025 inch.

Oiling.—Refill the cup under the distributor head with soft cup grease and turn down two turns every two weeks. At the same time put a small amount of vaseline on the fiber bumper of the contact arm, using a toothpick. If the car is driven more than 500 miles in two weeks, these attentions should be given every 500 miles.

Starter.—Starter is connected to the engine through a Bendix drive. It should run at 1500 R. P. M., when delivering 2 pound-feet torque. It should develop 11.5 pound-feet lock torque, taking about 400 amperes.

Oiling.—Refill the oil wells under the starter bearings with light machine oil every three months.

Generator.—Generator voltage regulation is by a vibrating regulator. Relay is combined with the regulator. The charging current should be about 1.5 amperes at closing and the discharge current 1.25 amperes at opening of relay contacts. The air gap between relay armature (moving member) and coil core should be .027 inch to .030 inch. Contacts should separate .013 inch to .017 inch. Adjust by bending brass prongs. Clean relay and regulator contacts by drawing a piece of unglazed paper between them. If badly burned or pitted, resurface them with a piece of well worn No. 00 sand paper, drawing a piece of unglazed paper between them, to remove all grit, before again putting into service. Generator should deliver 14 amperes at 7.5 volts.

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Lamps.—Head lamps are 6-8 volts, 15 cp. Dash lamp is 6-8 volts, 2 cp. Tail lamp is 6-8 volts, 2 cp.

Fuses.—Fuses are 20 ampere.

Jackson

Model 46 (1915)

Auto-Lite Starting and Lighting System

Connecticut Ignition

Plate No. 258

Battery—Battery is 6 volt, 100 ampere-hour. The negative (—) terminal is grounded. Five dry cells are connected so that they can be switched into the ignition circuit should other voltage sources fail.

Ignition—Breaker contacts should separate .018 inch to .020 inch. They are made of tungsten. They will operate properly even though quite rough. Should they become badly worn, affecting the ignition, the inner breaker mechanism should be renewed as directed on Page 50. In an emergency, contacts may be resurfaced enough to give service for 300 or 400 miles by drawing a piece of fine emery cloth between them.

Timing—Contacts should begin to separate when the piston entering power stroke is on top dead center, spark control lever within one inch of the fully retarded position. See that breaker assembly is fully retarded when lever is in the fully retarded position.

Firing Order—The firing order is 1, 3, 4, 2.

Spark Plug Gaps—Spark plug gaps should be about .027 inch.

Oiling—Refill the cup under the breaker head with pure vaseline and turn down every month. If car is driven more than 1000 miles in a month, these attentions must be given every 1000 miles. Do not put grease or oil in the cup.

Starter—Starter is connected to engine through a Bendix drive. It should crank the engine at 125 to 150 R.P.M. Cold engine, tight bearings, heavy oil or other obstructions will cause a greater current flow and reduce the speed. When running free, armature should turn at about 4200 R. P. M., taking 50 to 55 amperes. Much greater speed indicates grounded, short circuited or damp field windings. Greater current or vibrating of the ammeter needle indicates grounded or short circuited armature coils or commutator. Damp armature windings will cause high current or slow speed.

STARTER DATA, MODEL MC

Torque	R. P. M.	Amperes
1 lb. ft.	100	2650
2 lb. ft.	145-150	1960
3 lb. ft.	185-190	1600
4 lb. ft.	225	1400
5 lb. ft.	250-255	1250
6 lb. ft.	290-300	1000

Starter should develop 16 pound-feet lock torque, taking about 450 amperes when so operating, voltage being about 4.2 volts, current flowing.

Brushes—Use only the special copper-carbon composition type brushes as furnished by the manufacturer, as ordinary carbon brushes will cause trouble, their use on either motor or generator forfeiting the guarantee.

Oiling—Motor bearings are packed with grease. Bearings should be cleaned out thoroughly and repacked with grease twice a season. Do not oil the Bendix drive. Should the pinion stick, clean shaft with gasoline.

Generator—Generator current regulation is by reverse series field. Relay should close at 230 to 270 R. P. M., of generator armature. Charging current should be .5 to 1.0 ampere immediately after contacts close. Contacts should separate when the discharge current reaches 0 to .5 ampere.

Amperes	GENERATOR DATA, MODEL GF	R. P. M.
5		430-490
10		730-870
12		945-1180
15		1225-1560
16-19		2200-2800

Shunt field should take approximately one ampere. When operated freely as a motor, generator should run at about 200 R. P. M., taking 1.8 amperes. Higher speeds indicates grounded, wet or short circuited field windings. A greater current, lower speed or vibrating of armature needle indicates grounded or short circuited armature coils or commutator bars or damp armature, providing bearings are not tight.

Oiling—Put 4 or 5 drops of light engine oil in each of generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Lamps—Head lamps are 6-8 volts, 8 cp. Dimmer lamps are 6-8 volts, 4 cp. Dash lamp is 6-8 volts, 4 cp. Tail lamp is 6-8 volts, 4 cp.

Model Numbers—Generator is Model GF. Starter is Model MC.

Jackson

Model 44 (1915-16) North-East Starting and Lighting System Connecticut Ignition

Plate No. 259

Battery.—Battery is 6 volt, 100 ampere-hour. The two wire system is used. There is a set of four dry cells connected so that they may be connected into the ignition circuit should the other sources fail.

Ignition.—Breaker contacts should separate about .020 inch. They are made of tungsten. They will operate properly even though quite rough. Should they become badly worn, affecting the ignition, the inner breaker mechanism should be renewed as directed on Page 50. In an emergency, contacts may be resurfaced enough to give service for 300 or 400 miles by drawing a piece of fine emery cloth between them.

Timing.—Contacts should begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plug Gaps.—Spark plug gaps should be .025 inch to .030 inch.

Oiling.—Refill the cup under the breaker head with pure vaseline and turn down every month. If car is driven more than 1000 miles in a month, the oiling must be done every 1000 miles. Do not put grease or oil in the cup.

Starter.—Starter is connected to the engine through a Bendix drive. Cold engine, heavy oil, tight bearings or other obstructions or damp, grounded or short circuited motor windings or commutator bars will cause low speed and excessive current during the cranking operation.

STARTER DATA, MODELS H AND K

Torque	R. P. M.	Frame 8550		Frame 8306	
		Amperes	R. P. M.	Amperes	R. P. M.
1 lb. ft.	2300	95	2100	80	1700
2 lb. ft.	1700	130	1600	135	1400

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Lamps.—Head lamps are 6-8 volts, 15 cp. Dimmer lamps are 6-8 volts, 5 cp. Dash lamp is 6-8 volts, 2-4 cp. Tail lamp is 6-8 volts, 2-4 cp.

Plate No. 260

Jackson

Model 34 (1916) Auto-Lite Starting and Lighting Syst m Connecticut Ignition

Battery.—Battery is 6 volt, 85 ampere-hour. The 'negative' (-) terminal is grounded at the starting motor.

Ignition.—Breaker contacts should open .018 inch to .020 inch. The tungsten contacts cannot be properly resurfaced by filing or sand papering. Should they become badly worn, affecting the ignition, the inner breaker mechanism should be renewed as directed on Page 50. In an emergency, contacts may be resurfaced sufficiently to operate 300 or 400 miles by drawing a piece of fine emery cloth between them.

Timing.—Contacts should begin to separate when the piston entering power stroke is on top dead center, or a trifle past, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plug Gaps.—Spark plug gaps should be .027 inch to .030 inch.

Oiling.—The cup under the breaker head should be filled with pure vaseline and turned down every month. If car is driven more than 1000 miles in a month, this should be done every 1000 miles. Never put in grease or oil.

Starter.—Starter is connected to the engine through a Bendix drive. It should crank the engine at 125 to 150 R. P. M., taking about 250 amperes.

Oiling.—The starter bearings are packed with grease. Bearings should be cleaned out thoroughly and repacked with grease twice a season.

Generator.—Generator current regulation is by reverse series field. Relay should close at about 10 and open at about 8 miles per hour. Clean contacts by drawing a piece of soft paper between them. If they are burned or pitted, resurface with a piece of worn No. 00 sand paper.

Output.—Generator output should be 12½ amperes at 1120 to 1370 R. P. M., 15 amperes at 1875 to 1800 R. P. M., and 17-19 amperes at 2400 to 2800 R. P. M. Relay should close at 230 to 270 R. P. M., the charging current being about .5 ampere immediately after. Relay should open when the discharge current reaches .0 to .5 amperes.

Testing.—When operating freely as a motor, generator should run at about 200 R. P. M., taking about 1.8 amperes. Shunt field should take approximately 1 ampere.

Brushes.—Use only the special copper-carbon composition brushes as furnished by the manufacturers. Ordinary carbor brushes will only cause trouble.

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Lamps.—Head lamps are 6-8 volts, 15 cp. Dash and tail lamps are in series. They are each 3-4 volts, 2 cp.

Fuses.—Lighting fuse is 20 ampere.

Model Numbers.—Starter Model is MF. Generator is Model GA.

JACKSON
1916-1917
AUTO-LITE STARTER & GENERATOR
CONNECTICUT IGNITION

Continued on next page.

Plate No. 261

Models 68 and 348 (1916) 349 (1917-18)
Auto-Lite Starting and Lighting System. Connecticut Ignition
Battery.—Battery is 6 volt, 100 ampere-hour on the Model 68 cars and 6 volt, 80 ampere-hour on the other models. The negative (—) terminal is grounded at the starting motor.
Ignition.—Breaker contacts should separate .018 inch to .020 inch. They are made of tungsten. They will operate properly even though quite rough. Should they become badly worn, affecting the ignition, the inner breaker mechanism should be renewed as directed on Page 50. In an emergency, contacts may be resurfaced enough to give service for 300 or 400 miles by drawing a piece of fine emery cloth between them.
Timing.—Contacts should begin to separate when the piston entering power stroke is on top dead center, spark control lever within one inch of the fully retarded position. See that breaker assembly is fully retarded when lever is in fully retarded position.
Firing Order.—The firing order is 1R, 1L, 3R, 3L, 4R, 4L, 2R, 2L.
Spark Plug Gaps.—The spark plug gaps should be about .027 inch.
Oiling.—Refill the cup under the breaker head with pure vaseline and turn down every month. If car is driven more than 1000 miles in a month, this must be done every 1000 miles. Do not put grease or oil in this cup.
Starter.—Starter is connected to engine through a Bendix drive. It should crank the engine at about 125 R. P. M., taking 200 to 250 amperes. Cold engine, tight bearings, heavy oil or other obstructions will cause a greater current flow and reduce the speed. When running free, armature should turn at about 4200 R. P. M., taking 50 to 55 amperes. Much greater speed indicates grounded, short circuited or damp field windings. Greater current or vibrating of the ammeter needle indicates grounded or short circuited armature coils or commutator. Damp armature windings will cause high current or slow speed.

STARTER DATA, MODEL MC

Torque	R.P.M.	Amperes
1 lbs. ft.	2650	100
2 lbs. ft.	1900	145-150
3 lbs. ft.	1600	185-190
4 lbs. ft.	1400	225
5 lbs. ft.	1250	250-255
6 lbs. ft.	1000	290-300

Motor should develop 16 pound-feet lock torque, taking 450-460 amperes at 3.8-4.2 volts.

Brushes.—Use only the special copper-carbon composition brushes as furnished by the manufacturer, as ordinary carbon brushes will cause trouble and their use on motor or generator forfeits the guarantee.

Oiling.—Starter bearings are packed with grease. Bearings should be thoroughly cleaned and repacked with grease twice a season. Do not oil the Bendix drive. Should pinion stick, clean shaft with gasoline.

Generator.—Generator current regulation is by reverse series field. Relay should close at 500-575 R. P. M., of generator armature, charging current being .5 to 1.5 ampere at closing. Relay should open when the discharge current reaches 0 to 1 ampere.

Amperes	R. P. M.
5	750-860
10	1225-1400
12.5	1600-1825
15	2175-2450
17-19	3200-3700

A variation of 1 to 1.5 amperes from this amount is allowable. The output may be varied slightly by varying brush pressure on commutator. The pressure should be 1 to 1 1/4 pounds. If operated freely as a motor, armature should revolve at 350 R. P. M., taking 2.8 amperes. Much higher speed indicates damp, grounded or short circuited field coils. Greater current or lower speed indicates tight bearings or damp, grounded or short circuited armature windings or commutator. Periodic swinging of armature needle indicates grounded or short circuited armature coils or commutator bars. Shunt field should take 1.1 amperes.

Oiling.—Put 4 or 5 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oil every 500 miles.

Lamps.—Head lamps are 6-8 volts, 15 cp. On Models 68 and 348, dash and tail lamps are in series. They are each 3-4 volts, 2 cp. On Model 349, dash lamp is 6-8 volts, 2 cp. Tail lamp is 6-8 volts, 2 cp.

Fuses.—Lighting fuses are 20 ampere.

Mod 1 Numbers.—Generator is Model GG. Starter is Model MC.

Battery.—Battery is 6 volt, 80 ampere-hour. The negative (—) terminal is grounded.

Ignition.—Breaker contacts should separate .018 inch to .020 inch. They are made of tungsten. They will operate properly even though quite rough. Should they become badly worn, affecting the ignition, the inner breaker mechanism must be renewed as directed on Page 50. In an emergency, contacts may be resurfaced sufficiently to last 300 or 400 miles by drawing a piece of fine emery cloth between them.

Timing.—Contacts should begin to separate when the piston entering power stroke is on top dead center, spark control lever one-third advanced. See that breaker assembly is fully retarded when spark control lever is in the fully retarded position.

Firing Order.—The firing order is 1, 4, 2, 6, 3, 5.

Spark Plug Gaps.—Spark plug gaps should be about .027 inch.

Oiling.—Refill the cup under breaker head with pure vaseline and turn down every month. If car is driven more than 1000 miles in a month, this must be done every 1000 miles. Do not put grease or oil in the cup.

Starter.—Starter is connected to engine through a Bendix drive. It should crank the engine at about 125 R. P. M., taking about 250 amperes. Cold engine, tight bearings, heavy oil or other obstructions will cause a greater current flow and reduce the speed. When running free, armature should turn at about 4200 R. P. M., taking 50-55 amperes. Much greater speed indicates grounded, short circuited or damp field windings. Greater current or vibrating of the ammeter needle indicates grounded or short circuited armature coils or commutator. Damp armature windings will cause high current or slow speed.

AUTOLITE STARTING AND LIGHTING SYSTEM
CONNECTICUT IGNITION.

Plate No. 263

Plate No. 264

Case

Model T (1916)

Westinghouse Starting and Lighting System

Westinghouse Ignition

Battery.—Battery is 6 volt, 70 ampere-hour. The positive (+) terminal is grounded.

Ignition.—Breaker contacts should separate .006 inch to .008 inch. Should they become burned or pitted, resurface them with a fine, flat jeweler's file. The springs should exert just enough pressure on the distributor brushes to force them $\frac{1}{4}$ inch past the top of the holder when the distributor cap is removed, but should retain them firmly so that they do not tend to fall out. Brushes must move freely in their holders. Be sure that both brushes are in place when replacing the rotor. (There is a brush on both the top and bottom side of the rotor.)

Timing.—Contacts should begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position. Contacts are beginning to separate when end of the rotor is directly opposite the V notch on the rim of the case.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plug Gaps.—Spark plug gaps should be about .023 inch.

Ballast Resistor.—There is a ballast resistor in the ignition switch. A fuse must not be permanently substituted for this resistor. In case it is necessary to operate the car with the ballast defective, a 5 ampere fuse may be used temporarily, but the ballast must be replaced as soon as possible, as continued operation without it will result in serious burning of the timer contacts.

Oiling.—Put 2 or 3 drops of light machine oil in the oiler at the side of breaker assembly every month. If car is driven more than 1000 miles in a month, the oiling must be done every 1000 miles.

Starter.—Starter is connected to the engine through a Bendix drive. It should run at 1500 R. P. M., when delivering 2 pound-feet torque. It should develop 11.5 pound-feet lock torque, taking about 400 amperes.

Oiling.—Put 4 or 5 drops of light engine oil in each of the starter oilers every month.

Generator.—Generator voltage regulation is by a vibrating regulator. Relay is combined with the regulator. The charging current should be 1 to 1.5 amperes at closing and the discharge current .5 to 1.25 amperes at opening of relay contacts. The air gap between relay armature (moving member) and coil should be .027 inch to .030 inch. Contacts should separate .013 inch to .017 inch. Adjust by bending the brass prongs. Clean relay and regulator contacts by drawing a piece of unglazed paper between them. If badly burned or pitted, resurface them with a piece of well worn No. 00 sand paper, drawing a piece of unglazed paper between them, to remove all grit, before again putting into service.

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Lamps.—Head lamps are 6-8 volts, 20 cp. Dash lamp is 6-8 volts, 4 cp. Tail lamp is 6-8 volts, 4 cp. Trouble lamp is 6-8 volts, 4 cp.

Fuses.—Fuses are 20 ampere.

Plate No. 265

Allen

Models 33-34 (1914-15)

Westinghouse Starting and Lighting System

Westinghouse Ignition

Battery.—Battery is 6 volts, 85 ampere-hour. The positive (+) terminal is grounded.

Ignition.—The ignition system and generator is combined into one unit. The breaker is operated direct from the armature shaft. The centrifugal weights perform the double duty of automatically advancing and retarding the spark in relation to the engine speed, and of closing the timer contacts at the proper time. As these weights are revolved, they bear against the fiber bumper on the contact arm, pushing it down and causing the contact points to be brought together. As the weights are moved further, their bearing surface passes off the fiber bumper, which allows the spring to force contact arm upwards, causing the contacts to be quickly separated. As the speed increases, the weights are thrown out from the center, and automatically advance the time of opening of the contacts, hence advancing the spark. The weights are so shaped that they permit the contacts to be closed a greater part of the revolution, as the spark advances, resulting in a uniform spark at all speeds.

Timing.—To time generator to engine, first turn engine until the piston of No. 1 cylinder is on top dead center, both valves closed, then remove distributor plate and turn generator armature back until the mark on distributor brush holder lines up with the mark on the end bracket. Connect to engine in this position and connect spark plug to the distributor according to the firing order. Should timer contacts become badly burned or pitted, resurface them with a fine, flat jeweler's file or a strip of worn No. 00 sand paper.

Firing Order.—The firing order is 1, 2, 4, 3.

Spark Plug Gaps.—Spark plug gaps should be about .023 inch.

Starter.—Starter is connected to the engine through a Bendix drive. Cold engine, heavy oil, tight bearings or other obstructions or damp, grounded or short circuited motor windings or commutator bars will cause high current or low speed during cranking operation.

Oiling.—Put several drops of light engine oil in each of the starter oilers every month.

Generator.—Generator charging current regulation is by reverse series field. Current taken by the lamps does not flow through the series field hence has but little effect on the charging rate.

GENERATOR DATA. FRAME NOS. 202, 203, 230 AND 240.

Speed in R. P. M.	Total Output Lamp and Charging Current Amperes	Charging Current Lamps Out Amperes
400	2	1.0- 1.5
500	5-6	2.5- 3.0
750	10	6.0- 6.5
1000	13	8.5- 9.0
1250	15-16	9.5-10.0
1500	16-17	10.5-11.0
2000	18	11.0-12.0
3000	19	12.

Relay contacts should separate .013 inch to .017 inch. The air gap between relay armature (moving member) and coil core should be .027 inch to .030 inch. Adjust relay by bending the brass prongs. Clean contacts by drawing a piece of unglazed paper between them. If badly burned or pitted, resurface with a piece of well worn No. 00 sand paper, drawing a piece of unglazed paper between them, to remove all grit, and adjust, before again putting into service.

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Lamps.—Head lamps are 6-8 volts, 15 cp. Dash lamp is 6-8 volts, 2 cp. Tail lamp is 6-8 volts, 2 cp.

Model 35 (1914-15) Auto-Lite Starting and Lighting System Connecticut Ignition

Plate No. 266

Battery.—Battery is 6 volt, 100 ampere-hour. The negative (—) terminal is grounded at the starting motor.

Ignition.—Breaker contacts should separate .018 inch to .022 inch. They are made of tungsten. They will operate properly even though quite rough. Should they become badly worn, affecting the ignition, the inner breaker mechanism should be renewed as directed on Page 50. In an emergency, contacts may be resurfaced enough to give service for 300 or 400 miles by drawing a piece of fine emery cloth between them.

Timing.—Contacts should begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 2, 4, 3.

Spark Plug Gaps.—Spark plug gaps should be about .027 inch.

Oiling.—Refill the cup under the breaker head with pure vaseline and turn down every month. If car is driven more than 1000 miles in a month, the oiling must be done every 1000 miles.

Starter.—Starter is connected to the engine through a Bendix drive. It should crank the engine at about 125 R. P. M., taking about 250 amperes. Cold engine, tight bearings, heavy oil or other obstructions will cause a greater current flow and reduce the speed. When running free, Model M armature should revolve at about 1800 R. P. M., taking 60 amperes, and Model MC at about 4200 R. P. M., taking 50-55 amperes. Greater speed indicates grounded, short circuited or damp field windings. Greater current or vibrating of the ammeter needle indicates grounded or short circuited armature coils or commutator. Damp armature windings will cause high current or slow speed.

STARTER DATA, MODEL MC.

Torque	R. P. M.	Amperes
1 lb. ft.	2650	100
2 lb. ft.	1900	145-150
3 lb. ft.	1600	185-190
4 lb. ft.	1400	225
5 lb. ft.	1250	250-255
6 lb. ft.	1000	290-300
16 lb. ft.	Lock	450-460

Oiling.—Clean and repack starter bearings with soft cup grease every six months. Put in one or two drops of oil every month to keep grease soft. Do not oil the Bendix drive. Should pinion stick, clean shaft with gasoline.

Generator.—Generator current regulation is by reverse series field. Relay should close at 8-10 and open at 6-8 miles per hour. Charging current should be .6 to 1.5 amperes at closing and discharge current 0 to 1 ampere at opening.

GENERATOR DATA.

Model G		Model GA	
Amperes	R. P. M.	Amperes	R. P. M.
Neutral	200	Neutral	260-300
5.0	520	5.0	430-490
10	710	10	730-780
12.5	1150	12.5	1120-1370
16	2000	15	1475-1810
12-14	2200	17-19	2400-2800

A variation of 1.5 amperes from these rates is allowable. The output may be varied somewhat by adjusting the brush pressure on the commutator. The pressure should be 1 to 1 1/4 pounds. If operated freely as a motor, the Model G generator should take 2 amperes, armature revolving at 200 R. P. M. Shunt field should take .9 ampere. The Model GA generator should take 1.8 amperes, armature revolving at 200 R. P. M. Shunt field should take 1 ampere. Much higher speed indicates damp, grounded or short circuited field coils. Greater current or lower speed indicates tight bearings or damp, grounded or short circuited armature windings or commutator. Periodic swinging of ammeter needle indicates grounded or short circuited armature coils or commutator bars.

Oiling.—Put 4 or 5 drops of light engine oil in each of the generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Lamps.—Head lamps are 6-8 volts, 15 cp. Dash lamp is 6-8 volts, 2 cp. Tail lamp is 6-8 volts, 2 cp.

Model Numbers.—Starters are Model M and MC. Generators are Model G and GA.

Plate No. 267

ALLEN

Model 37 (1916) And Classic Model (1917)

Westinghouse Starting and Lighting System

Westinghouse Ignition

Battery.—Battery is 6 volt, 85 ampere-hour. The positive (+) terminal is grounded.

Ignition.—Breaker contacts should separate .006 inch to .008 inch. Should they become burned or pitted, resurface them with a fine, flat jeweler's file. The springs should exert just enough pressure on the distributor brushes to force them $\frac{1}{4}$ inch past the top of the holder when the distributor cap is removed, but should retain them firmly so that they do not tend to fall out. Brushes must move freely in their holders. Be sure that both brushes are in place when replacing the rotor. (There is a brush on both the top and bottom side of the rotor.)

Timing.—Contacts should begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 2, 4, 3.

Spark Plug Gaps.—Spark plug gaps should be about .023 inch.

Ballast Resistor.—There is a ballast resistor in the ignition switch. A fuse must not be permanently substituted for this resistor. In case it is necessary to operate the car with the ballast defective, a 5 ampere fuse may be used temporarily, but the ballast must be replaced as soon as possible, as continued operation without it will result in serious burning of the timer contacts.

Oiling.—Put 2 or 3 drops of light machine oil in the oiler at the side of breaker assembly every month. If car is driven more than 1000 miles in a month, the oiling must be done every 1000 miles.

Starter.—Starter is connected to the engine through a Bendix drive. It should run at 1500 R. P. M., when delivering 2 pound-feet torque. It should develop 11.5 pound-feet lock torque, taking about 400 amperes.

Oiling.—Refill the oil cups under the starter bearings with light machine oil every three months.

Generator.—Generator voltage regulation is by third brush system. Generator should deliver 16 amperes at 7.5 volts. Higher voltage indicates damp, grounded or short circuited field coils, dirty commutator, defective brushes, defective connection in field circuits, or defective armature. Relay contacts should separate .013 inch to .017 inch. Air gap between relay armature (moving member) and coil core should be .027 inch to .030 inch. Adjust regulator by bending the brass prongs. Clean relay contacts by drawing a piece of unglazed paper between them. If badly burned or pitted, resurface them with a piece of well worn No. 00 sand paper, drawing a piece of unglazed paper between them, to remove all grit, and adjust before again putting into service. Charging current should be 1 to 1.5 amperes at closing and .5 to 1.5 amperes at opening of relay contacts.

Oiling.—Put 4 or 5 drops of light engine oil in each of the generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Lamps.—Head lamps are 6-8 volts, 15 cp. Dimmer lamps are 6-8 volts, 5 cp. Dash and tail lamps are each 6-8 volt, 2 cp. On the Classic Model head lamps are 6-8 volt, 17 cp. Some of the Model 37 cars used a dimmer resistance instead of dimmer bulbs.

FUSES.—Fuses are 15 ampere.

Continued on next page.

Plate No. 268

Plate No. 269

Saxon

Model "Six" 1915-16

Gray & Davis Starting and Lighting System
Atwater-Kent Ignition

Battery.—Battery is 6 volt, 85 ampere-hour. The positive (+) terminal is grounded.

Ignition.—Breaker contacts should separate .010 inch to .012 inch. They are made of tungsten. They will operate properly even though quite rough. Should they become burned or corroded, affecting the ignition, remove and resurface them by drawing across a piece of fine emery cloth laid on a flat surface, as on the bed of a drill press, finishing on a hard oil stone.

Timing.—Spark should occur when the piston entering power stroke is on top dead center spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—Spark plug gaps should be .027 inch to .030 inch.

Oiling.—Put 4 or 5 drops of light engine oil in the oil hole at the side of the shaft every two weeks. At the same time put a small amount of oil or vaseline on all the other wearing parts of the breaker. See that no oil or vaseline reaches the contacts. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Motor-Generator.—Motor and generator are combined into one unit.

Generator.—Generator voltage regulation is by a vibrating regulator mounted on top of generator. Relay is combined with the regulator. Clean relay and regulator contacts by drawing a piece of unglazed paper between them. If badly burned or pitted, resurface by drawing a piece of worn No. 00 sand paper between them, drawing a piece of unglazed paper between them, to remove all grit, before again putting into service. After cleaning, regulator contacts may require adjusting. Directions for adjusting are given below. The air gap between relay armature (moving member) and coil core should be .030 inch. Air gap between regulator armature and coil core should be .025 inch. When operating freely as a motor, generator should take 10 amperes, armature turning at 700 R. P. M. To take this reading, the three terminals leading from the generator field to regulator should be connected together. A variation of 10% from these ratings is allowable. If machine does not test O. K., remove regulator and repeat the test, field terminals still connected together. Much higher speed indicates damp, grounded or short circuited field coils. Greater current or lower speed indicates tight bearings or damp, grounded or short circuited armature windings or commutator. Periodic swinging of ammeter needle indicates grounded or short circuited armature coils or commutator bars. Shunt field should take .96 to 1.2 amperes at 6 volts. Generator should deliver 8 amperes at 1575 R. P. M. To take this reading, the three terminals on top of generator should be connected together as above, to give full field current. If it does not, adjust the regulator. With a 7½ ampere lamp load, charging rate should be 1 to 4.5 amperes. The maximum generator output, with a 7½ ampere lamp load should be 8.5 to 11 amperes, depending on the state of charge of the battery.

Adjusting Regulator.—To adjust regulator, hold upper contacts open and adjust lower set until the desired output is attained. Then hold open lower set and adjust the upper set. When both are allowed to operate together, the output should be the desired rate.

Oiling.—Put 6 to 8 drops of light engine oil in each of the motor-generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Lamps.—Head lamps are 6-8 volts, 12 cp. Dash lamp is 6-8 volts, 2 cp. Tail lamp is 6-8 volts, 2 cp.

Model Numbers.—Motor-generator is Model MG-9. Atwater-Kent breaker is type K-2, standard coupling being used.

Plate No. 270

Willys-Overland

Model 89-6 (1918) Auto-Lite Starting and Lighting System Connecticut Ignition

Battery.—Battery is 6 volt, 80 ampere-hour. The negative (—) terminal is grounded at the starting motor.

Ignition.—Breaker contacts should separate .016 inch to .018 inch. They are made of tungsten. They will operate properly even though quite rough. Should they become badly worn, affecting the ignition, the inner breaker mechanism should be renewed as directed on Page 50. In an emergency, contacts may be resurfaced enough to give service for 300 or 400 miles by drawing a piece of fine emery cloth between them.

Timing.—Contacts should begin to separate when the mark "1-6 D-C" on the flywheel is $1\frac{1}{8}$ inches past the indicator, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—Spark plug gaps should be about .023 inch.

Ignition Thermostat.—There is a thermostat in the ignition switch case to open the circuit should switch be left "On," engine idle, contacts closed. This device is treated on Page 41.

Oiling.—Refill the cup under the breaker head with pure vaseline and turn down every month. If car is driven more than 1000 miles in a month, this must be done every 1000 miles. Do not put grease or oil in the cup.

Starter.—Starter is connected to the engine through a Bendix drive. It should crank the engine at 100 to 125 R. P. M., taking about 250 amperes. Cold engine, tight bearings, heavy oil or other obstructions will cause a greater current flow and reduce the speed.

Oiling.—Clean and repack starter bearings with soft cup grease every six months.

Generator.—Generator current regulation is by reverse series field. Relay should close at 8-10 M. P. H., or 300-380 R. P. M., of generator armature. Charging current should be .6 to 1.5 amperes at closing and discharge current 0 to 1 ampere at opening.

Amperes	GENERATOR DATA, MODEL GA	R. P. M.
5		550-560
10		980-1120
12.5		1365-1570
15		1850-2400
16-18		3000-3750

A variation of 1.5 amperes from these rates is allowable. Output may be varied slightly by adjusting brush pressure on commutator. The pressure should be 1 to $1\frac{1}{4}$ pounds. If operated freely as a motor, armature should revolve at 200 R. P. M., taking 2 amperes. Much higher speed indicates damp, grounded or short circuited field coils. Greater current or lower speed indicates tight bearings or damp, grounded or short circuited armature windings or commutator. Periodic swinging of ammeter needle indicates grounded or short circuited armature coils or commutator bars. Shunt field should take about 1.4 amperes.

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Lamps.—Head lamps are 6-7 volts, 16 cp. Dash and tail lamps are in series. They are each 3-3.5 volts, 2 cp.

Fuses.—Fuses are 20 ampere.

PAIGE

MODEL 6-46 (1915-16). SERIAL NOS. 55,000 TO 69,999 GRAY & DAVIS GENERATING, STARTING AND LIGHTING SYSTEM REMY IGNITION

Plate No. 271

Battery—Battery is 6 volt, 85 ampere-hour. The positive (+) terminal is grounded at the starting switch.

Ignition—Breaker contacts should separate .020 inch to .025 inch. Should they become badly burned or pitted, affecting the ignition, resurface them with a fine, flat jeweler's file or a strip of worn No. 00 sand paper.

Timing—Contacts should begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

Firing Order—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps—Spark plug gaps should be .025 inch.

Oiling—Refill the cup under the distributor head with soft cup grease and turn down two turns every two weeks. At the same time put a small amount of vaseline on the fiber bumper of the contact arm, using a toothpick. If car is driven more than 500 miles in two weeks, these attentions should be given every 500 miles.

Starter—Starter is connected to the engine through a Bendix drive. When operating freely, starter type 120 should take 35 amperes, armature revolving 2200 R. P. M., at 3 volts, 4500 R. P. M., at 5.5 volts and 5000 R. P. M., at 6 volts pressure. A variation of 25% in current reading is allowable. High current and low speed indicates damp, grounded or short circuited armature winding, field coils or commutator bars. High speed indicates damp, grounded or short circuited field coils or pole pieces loose in the frame. Starter should take about 100 amperes when delivering 1.5 pound-feet torque, armature turning at 1660 R. P. M., voltage being $5\frac{3}{4}$ volts, specific gravity of battery 1.250 or above. Brush pressure on commutator should be $2\frac{1}{4}$ pounds.

Oiling—Put 4 or 5 drops of light engine oil in each of the starter oilers every month.

Generator—Generator voltage regulation is by a vibrating regulator. Relay is combined with the regulator. With a $7\frac{1}{2}$ lamp load generator type 210 should charge battery at 1 to 6 amperes and generator type 222, 240 and 250 at 1 to 4.5 amperes. Total generator output with a $7\frac{1}{2}$ ampere lamp load should be 8.5 to 12 amperes, depending on the state of charge of battery. When operating freely as a motor, generator should take 3 amperes, armature revolving at 320 R. P. M., on type 210 and at 335 R. P. M., on types 222, 240 and 250. A variation of 10% from these amounts is allowable. Higher speed indicates damp, grounded or short circuited field coils, or pole pieces loose in the frame. Low speed and high current indicates damp, grounded or short circuited armature windings or commutator bars. Moving of the ammeter needle at low speed indicates grounded or short circuited armature coils or commutator bars. To test generator, connect together the three terminals on top of the frame, leading from field and armature to the regulator to give full field current and drive armature of types 210 at 750 R. P. M., or that of types 222, 240 or 250 at 700 R. P. M. Generator should deliver 10 amperes, $7\frac{1}{2}$ ampere lamp load and battery reading 1.250 or above, in the circuit. If it will not, remove the regulator and with terminals still connected, test again. If it then delivers the required output, adjust the regulator. If it will not, test for grounded, short circuited or damp armature windings or commutator bars, or pole pieces loose in the frame and see that commutator and brushes are in good order. Shunt field of type 210 generator should take 1.09 to 1.32 amperes, that of type 222, .77 to 1.02 amperes, that of type 240, 1.54 to 2.04 amperes and that of type 250, 2.04 to 2.30 amperes.

Adjusting Regulator—To adjust regulator, hold the upper pair of contacts apart while the lower set is adjusted until the output falls within the desired limits. Then hold the lower pair apart while the upper set is adjusted. Then allowing both sets to operate together, the desired output should result. Generator armature should be driven at 1750 R. P. M., when adjusting regulator. Clean relay contacts by drawing a piece of unglazed paper between them. If burned or pitted, resurface with a piece of well worn No. 00 sand paper, drawing a piece of unglazed paper between them to remove all grit and adjusting before again putting into service. The air gap between the regulator armature (moving member) and coil core should be .030 inch.

Lamps—Head lamps are 6-8 volts, 15 cp. Dimmer lamps are 6-8 volts, 4 cp. Dash lamp is 6-8 volts, 2 cp. Tail lamp is 6-8 volts, 2 cp.

Fuses—Fuses are 20 ampere.

Plate No. 272

PAIGE

MODEL 6-38 (1916). SERIAL NOS. 85,000 TO 89,923
GRAY & DAVIS GENERATING, STARTING AND LIGHTING SYSTEM
REMY IGNITION

Battery.—Battery is 6 volt, 85 ampere-hour. The positive (+) terminal is grounded.

Ignition.—Breaker contacts should separate .020 inch to .025 inch. Should they become badly burned or pitted, affecting the ignition, resurface them with a fine, flat jeweler's file or a piece of worn No. 00 sand paper.

Timing.—Contacts should begin to separate when the top dead center mark "DC 1 & 6" on the flywheel is $1\frac{1}{4}$ inches past the indicator, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—Spark plug gaps should be .025 inch to .030 inch.

Oiling.—Refill the cup under the distributor head with soft cup grease and turn down every two weeks. At the same time put a small amount of vaseline on the fiber bumper of the contact arm, using a toothpick. If car is driven more than 500 miles in two weeks, these attentions should be given every 500 miles.

Starter.—Starter is connected to the engine through a Bendix drive. When operating free, it should take 35 amperes, armature revolving at 2200 R. P. M., with 3 volts pressure, 4500 R. P. M., at 5.5 volts pressure and 5000 R. P. M., at 6 volts pressure. A variation of 10% from these amounts is allowable, but never more. Excessive speed indicates damp, grounded or short circuited field coils. High current and low speed indicates damp, grounded or short circuited field coils or commutator bars. Brush pressure on commutator should be $2\frac{1}{4}$ pounds. When delivering $1\frac{1}{2}$ pound-feet torque, motor should revolve at 1660 R. P. M., taking 100 amperes at $5\frac{3}{4}$ volts, specific gravity of battery 1.250 or above.

Oiling.—Put several drops of light engine oil in each of the starter oilers every month.

Generator.—Generator voltage regulation is by a vibrating regulator. If operated freely as a motor, generator No. 210 should take 3 amperes, armature revolving at 320 R. P. M. No. 222 should take 3 amperes, armature revolving at 350 R. P. M. A variation of 10% from these amounts is allowable, but never more. Greater speed indicates damp, grounded or short circuited field coils. Slow speed and excessive current indicates damp, grounded or short circuited armature windings or commutator bars. Periodic swinging of the ammeter needle indicates grounded armature coils or commutator bars. With a $7\frac{1}{2}$ ampere lamp load, generator No. 210 should charge battery at 1 to 6 amperes and generator No. 222 at 1 to 4.5 amperes, depending on state of charge of the battery. To test generator, connect the three terminals on top of the generator leading from the armature and field to the regulator, to give full field current, and run generator No. 222 at 700 R. P. M., or No. 210 at 750 R. P. M. It should deliver 10 amperes at this speed. If it does not, remove regulator and with terminals still connected test again. If it will not then deliver the required output, test for grounded, short circuited or damp field or armature coils or commutator bars. If necessary, adjust the regulator.

Adjusting Regulator.—To adjust regulator, hold the upper contacts apart and adjust the lower set until the output falls within the desired limits. Then hold the lower set apart while the upper set is adjusted and allow both sets to operate together. The output should be the desired rate. Clean regulator contacts by drawing a piece of unglazed paper between them. If burned or pitted, resurface with a piece of well worn No. 00 sand paper, drawing a piece of unglazed paper between them, to remove all grit, and adjust, before again putting into service.

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Lamps.—Head lamps are 6-8 volts, 15 cp. Dimmer lamps are 6-8 volts, 5 cp. Dash lamp is 6-8 volts, 2 cp. Tail lamp is 6-8 volts, 2 cp.

Fuses.—Fuses are 20 ampere.

ANDERSON

SERIES 18 AND 20 (1919)

WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM REMY IGNITION

Plate No. 273

BATTERY.—Willard, Type SJWN-4, 6 volt, 113 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Coil Model No. 284B. Distributor Model No. 366C. Breaker contacts separate .022 inch. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Refill the cup under the distributor head with soft cup grease and turn down two turns every two weeks. Put a small amount of vaseline on the fiber bumper of the contact arm, applying with a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when the top dead center mark on the fly-wheel is $\frac{1}{2}$ inch past the indicator, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .030 inch.

STARTER.—Frame 710. Starter is connected to the engine through a Bendix drive.

Starter Data		
Torque	R.P.M.	Amperes
0 lb. ft.	4000	40
4 lb. ft.	1400	120
8 lb. ft.	700	280
14 lb. ft.	Lock	450

OILING.—Put 5 or 6 drops of light engine oil in each of the starter oilers every month.

GENERATOR.—Frame 760. Generator current regulation is by third brush system. Maximum current output is 15-17 amperes, reached at 1250 R.P.M. of the armature, or 20 miles per hour.

Cold Test		Generator Data		Hot Test	
Amperes	R.P.M.	Amperes	R.P.M.	Amperes	R.P.M.
0	450	0	500		
8	675	6	725		
12	840	9	850		
15-17	1250	11-13	1250		
10	2000	7-8	2000		

The cold test readings are obtained with a generator temperature under 95°F. The hot test readings are obtained after the generator has been operated one hour at 1800 R.P.M., charging a half-charged battery. The shunt field current is 2.8 to 3.25 amperes when 6 volts pressure is applied. When generator is operating freely as a motor, the current is 3.5 to 5 amperes at 6 to 6.6 volts.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted in generator frame. Relay closes at 500-550 R.P.M. of the generator armature or 8-9 miles per hour and opens at 450-500 R.P.M. of the armature or 7-8 miles per hour. Charging current is 1-2 amperes at closing, and the discharge current 0-2 amperes at the opening of relay contacts. Air gap between relay armature (moving member) and coil core is .031 inch, contacts separated. Contacts separate .013 to .018 inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp.

FUSES.—Fuses are 5 ampere.

Plate No. 274

Fiat

Models 55 (1915) 55 and C-3 (1917) Bosch-Rushmore Generating, Starting and Lighting System Bosch Magneto Ignition

Battery.—Battery is 6 volt, 120 ampere-hour. The positive (+) terminal is grounded.

Ignition.—Breaker contacts should separate .014 inch to .016 inch. If badly burned or pitted, affecting the ignition, resurface with a fine, flat jeweler's file or a strip of worn No. 00 sand paper.

Timing.—The fiber bumper on the contact arm should be entering the highest part of the cam when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plug Gaps.—Spark plug gaps should be .018 inch to .023 inch.

Oiling.—Put several drops of light machine oil in each of the magneto oilers every two weeks. At the same time put a very small amount of vaseline on the fiber bumper, using a toothpick. If car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

Starter.—The starter pinion is meshed with the flywheel gear by moving of the armature. The armature is constructed so that it has considerable end play. A spring at the commutator end normally holds the armature in such a position that the gears are demeshed. When the starting switch is moved so as to connect the first and second contacts a large current is allowed to flow through the motor field and a small current through the armature causing it to turn slowly, facilitating meshing of the gears. The strong attraction between the armature and field draws the armature further into the frame, meshing the gears. The switch is so constructed that when the gears are meshed the entire current flows through the armature and field windings in series so that the starter has its full power to crank the engine. When the engine starts, the current taken by the starter decreases sufficiently to allow the spring to force the armature out, demeshing the gears.

Oiling.—Put 5 or 6 drops of light engine oil in each of the starter oilers every two weeks. Remove the plug under the driving end bearing, clean out and renew the packing once or twice a season.

Generator.—Generator current regulation is by reverse series field and a regulating resistance. This regulation resistance is connected in shunt with the reverse series field. When cold, this unit has a very small resistance, but when hot it has a greatly increased resistance. When cold, it forms practically a short circuit across the series field terminals, allowing but little current to flow through the series field. As the current through the resistance increases, the temperature and resistance increases, causing more current to flow through the reverse winding, reducing the voltage. As the resistance of the regulating coil increases in proportion to the current through it, the current is held practically constant at speeds above that necessary to produce the maximum output. The output is changed by changing the regulating resistance unit.

Oiling.—Put several drops of light engine oil in each of the generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Lamps.—Head lamps are 6-8 volts, 24 cp. Side lamps are 6-8 volts, 4 cp. Dash and tail lamps are in series. They are each 3-4 volts, 2 cp.

Bosch Magneto Ignition
Continued from preceding page.

SERVICE ENGINEERING COMPANY, SAN FRANCISCO—COPYRIGHTED, 1926

1914-15-16-17

Battery.—Battery is 6 volt, 120 ampere-hour. The positive (+) terminal is grounded.

Ignition.—Magneto breaker contacts should separate .014 inch to .016 inch. Should they become badly burned or pitted, affecting the ignition, resurface them with a fine, flat jeweler's file or a piece of worn No. 00 sand paper. Type ZR magneto is treated on Page 186.

Timing.—Magneto breaker contacts should begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order of the six cylinder cars is 1, 4, 2, 6, 3, 5. The firing order of the four cylinder cars is 1, 3, 4, 2.

Spark Plug Gaps.—Spark plug gaps should be .018 inch to .022 inch.

Oiling.—Put 3 or 4 drops of light machine oil in each of the magneto oilers every two weeks. At the same time, put a very small amount of vaseline on the fiber bumper of the contact arm, applying with a toothpick. If car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

Starter.—Starter is connected to the engine by a pinion shifted by the operator. Cold engine, heavy oil, tight bearings or other obstructions or damp, grounded or short circuited motor windings or commutator bars will cause high current and low speed during the cranking operation.

Oiling.—Put several drops of light engine oil in each of the starter oilers every month. Keep the pinion and all sliding surfaces well oiled.

Generator.—Generator charging current regulation is by reverse field. Current taken by the lamps does not flow through the series field hence has but little effect on the charging rate.

Speed in R. P. M.	Total Output Lamp and Charging Current Amperes	Charging Current Lamps Out Amperes
400.....	2	1.0- 1.5
500.....	5- 6	2.5- 3.0
750.....	10	6.0- 6.5
1000.....	13	8.5- 9.0
1250.....	15-16	9.5- 10.0
1500.....	16-17	10.5- 11.0
2000.....	18	11.0- 12.0
3000.....	19	12.

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Lamps.—Head lamps are 6-8 volts, 17 cp. Dimmer and side lamps are 6-8 volts, 5 cp. Dash lamp is 6-8 volts, 2 cp. Tail lamp is 6-8 volts, 2 cp. Dome lamp is 6-8 volts, 2-4 cp. Pillar lamps are 6-8 volts, 4 cp.

Fuses.—On the 1914-15 cars small fuses are 5 ampere and the large fuses are 15 ampere. On the 1916-17 cars, 30 ampere fuses are used.

FIAT 1916-17

WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM BOSCH MAGNETO IGNITION

Plate No. 277

BATTERY.—Battery is 6 volt, 120 ampere-hour. The positive (+) terminal is grounded.
IGNITION.—Type ZR, Dual. Magneto breaker contacts separate .015 inch. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or well worn No. 00 sandpaper.

OILING.—Put 2 or 3 drops of light machine oil in the magneto oilers every two weeks. Put a small amount of vaseline on the fiber bumper of the contact arm, applying with a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Magneto breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 4, 2, 6, 3, 5, or 1, 3, 4, 2.

SPARK PLUG GAPS.—Spark plug gaps are .018 to .022 inch.

STARTER.—Frame No. 775 or 750. Starter is connected to the engine through a magnetically shifted pinion. The starting switch is also of the magnetic type, operated by a push button on the dash. Frame No. 750 develops 17.5 pound-feet lock torque taking 500 amperes at 4.25 volts. The lock torque of Frame No. 755 is 22 pound-feet, current being 485 amperes at 3.9 volts. Running freely, Frame No. 750 takes 40 ampere at 5.5 volts, armature revolving at 3500-5000 R.P.M. Running freely Frame No. 775 takes 36 amperes at 6.25 volts, armature revolving at 4000 R.P.M. Pinion must be pulled into mesh by 125 amperes and must not be held in by 40 amperes. Pressure of brushes on the commutator is 1 to 1¼ pounds.

OILING.—Put 5 or 6 drops of light engine oil in the starter oilers every month.

GENERATOR.—Frame No. 208. Generator current regulation is by reverse series field. Maximum charging rate is 11-15 amperes, reached at 1500 R.P.M. of the armature or 25 miles per hour.

Amperes	Generator Data	R.P.M.
0		425
8		650
11-15		1500

Shunt field current is 1.5-2.5 amperes at 6-6.3 volts. Operating freely as a motor generator takes 2.5-3.5 amperes at 6-6.3 volts. The current taken by the lamps does not pass through the reverse series field, hence has but little effect on the charging rate.

OILING.—Put 5 or 6 drops of light engine oil in the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted in the generator frame. Relay closes at 425-475 R.P.M. of the armature or 8-10 miles per hour and opens at 375-425 R.P.M. of the armature or 6-8 miles per hour. Adjust relay to open with a discharge current of 0-2 amperes from the battery, and close when the voltage of the generator reaches 7 to 7.5 volts, battery disconnected. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 17 cp. Dimmer lamps are 6-8 volt, 5 cp. Tail and dash lamps are 6-8 volt, 2 cp.

FUSES.—Fuses are 30 ampere.

Plate No. 278

Moline-Knight

Model MK-50 (1914-15)

Wagner Starting and Lighting System Connecticut Battery or Bosch Magneto

Battery.—Battery is 12 volt, 70 ampere hour. The two wire system is used. There is a tap taken off the battery to supply 6 volts to lights. There is a set of 6 dry cells connected in series to supply current for ignition should other sources fail.

Ignition.—Battery breaker contacts should separate .018 inch to .020 inch. They are made of tungsten. They will operate properly even though quite rough. Should they become badly worn, affecting the ignition, the inner breaker mechanism should be renewed as directed on Page 50. In an emergency, contacts may be resurfaced enough to give service for 300 to 400 miles by drawing a piece of fine emery cloth between them.

Timing.—Contacts should begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plug Gaps.—Spark plug gaps should be about .025 inch.

Oiling.—Refill the cup under the breaker head with pure vaseline and turn down every month. If car is driven more than 1000 miles in a month, this must be done every 1000 miles.

Starter.—Starter is connected to the engine through a Bendix drive. It should crank the engine at about 125 R. P. M., taking about 150 amperes. Cold engine, heavy oil, tight bearings or other obstructions, or damp, grounded or short circuited windings or commutator bars will cause low speed and excessive current during the cranking operation.

Oiling.—Put 5 or 6 drops of light engine oil in each of the starter oilers every month.

Generator.—Generator current regulation is by third brush system. Maximum output should be 8-10 amperes. Relay should close at 8-10 and open at 6-8 miles per hour, car speed. Maximum generator output should be reached at about 20 miles per hour. This rate reduces at higher speeds.

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling should be done every 500 miles.

Lamps.—Head lamps are 6-8 volts, 15 cp. Dimmer lamps are 6-8 volts, 4 cp. Dash lamp is 6-8 volts, 2 cp. Tail lamp is 6-8 volts, 2 cp.

Plate No. 279

Connecticut Ignition

Battery.—Battery is 6 volt, 100 ampere-hour. The positive (+) terminal is grounded at the starting motor.

Ignition.—Breaker contacts should separate .018 inch to .020 inch. They are made of tungsten. They will operate properly even though quite rough. Should they become badly worn, affecting the ignition, the inner breaker mechanism should be renewed as directed on Page 50. In an emergency, contacts may be resurfaced enough to give service for 300 or 400 miles by drawing a piece of fine emery cloth between them.

Timing.—Contacts should begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plug Gaps.—Spark plug gaps should be about .027 inch.

Oiling.—Refill the cup under the breaker head with pure vaseline and turn down every month. If car is driven more than 1000 miles in a month, this must be done every 1000 miles.

Starter.—Starter is connected to the engine through a Bendix drive. It should crank the engine at about 125 R. P. M., taking 150 to 230 amperes. Cold engine, tight bearings, heavy oil or other obstructions or damp, grounded or short circuited motor windings or commutator bars will cause low speed and high current during the cranking operation. When free to operate, motor should take 85 to 90 amperes, armature turning at about 1200 R. P. M. Much greater speed indicates damp, grounded or short circuited field coils. Low speed and high current or moving of ammeter needle at low speeds indicate damp, grounded or short circuited armature coils or commutator bars.

Oiling.—Put 5 or 6 drops of light engine oil in each of the starter bearing oilers every month. At the same time inject a quantity of grease in the plugged hole provided. Gredag is recommended for this purpose by the Wagner Electric Company.

Generator.—Generator current regulation is by third brush system. Relay should close at 8-10 and open at 6-8 miles per hour. The maximum generator output should be about 18 amperes at 8.6 volts, reached at 18-20 miles per hour. This rate reduces to about 9 amperes at about 35 miles per hour. If it is necessary to operate car with battery disconnected, ground the ungrounded generator terminal, to prevent burning out generator windings or lamps.

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Lamps.—Head lamps are 6-8 volts, 17 cp. Dimmer lamps (when used) are 6-8 volts, 5 cp. Dash lamp is 6-8 volts, 4 cp. Tail lamp is 6-8 volts, 2 cp. Tonneau lamp is 6-8 volts, 4 cp.

Fuse.—Fuse is 20 ampere.

MOLINE-KNIGHT MODELS M-K-40 (1914-15), M-K-40 AND 50 (1916-17-18), AND C AND G (1916-17-18) WAGNER GENERATING, STARTING AND LIGHTING SYSTEM. CONNECTICUT IGNITION Continued from preceding page.

Plate No. 281

Lozier

Models 82 and 84 (1915-16-17) Gray & Davis Starting and Lighting System Bosch Dual Ignition

Battery.—Battery is 6 volt, 85 ampere-hour. The positive (+) terminal is grounded.

Ignition.—Breaker contacts should separate .014 inch to .016 inch. Should they become badly burned or pitted, affecting the ignition, resurface them with a fine, flat jeweler's file or a strip of worn No. 00 sand paper.

Timing.—Contacts should begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—Firing order is 1, 4, 2, 6, 3, 5.

Spark Plug Gaps.—Spark plug gaps should be .018 inch to .022 inch.

Oiling.—Put 3 or 4 drops of light engine oil in each of the magneto oilers every two weeks. At the same time put a very small amount of vaseline on the fiber bumper of the contact arm, applying with a toothpick. If car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

Starter.—Starter is connected to the engine by a pinion shifted by the operator. The H-1 motor should run at 1500 R. P. M., taking 150 amperes at 6 volts. The H-2 motor should run at 2600 R. P. M., taking 150 amperes at 6 volts. Starter should crank the Model 82 engine at about 140 R. P. M., and the Model 84 engine at about 125 R. P. M., taking 200-300 amperes. The clutch must be in on Model 84 cars during the cranking operation, as starter drives through the transmission. Cold engine, heavy oil, tight bearings, or other obstructions, or damp, grounded or short circuited motor windings or commutator bars will cause low speed and excessive current during the cranking operation.

Oiling.—Put 5 or 6 drops of light engine oil in each of the starter oilers every month.

Generator.—Generator voltage regulation is by speed control. Generator should deliver 9 amperes at 6½ volts, reached at 1000 R. P. M. Same directions as given on Page 270 apply to this generator.

Oiling.—Put 5 or 6 drops of light engine oil in each of the three generator bearings every two weeks. At the same time oil the governor joints marked A (See Plate 210), with light engine oil. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Lamps.—Head lamps are 6-8 volts, 20 cp. Side lamps are 6-8 volts, 5 cp. Dash lamp is 6-8 volts, 2 cp. Tail lamp is 6-8 volts, 4 cp. Trouble lamp is 6-8 volts, 4-6 cp.

Fuses.—Fuses are 10 ampere.

Plate No. 282

Glide

Model 30 (1915) Westinghouse Starting and Lighting System Westinghouse Ignition

(This Page Applies to Cars Having Serial Numbers 7389 to 7698 Inclusive.)

Battery.—Battery is 6 volt, 85 ampere-hour. The positive (+) terminal is grounded at the starting motor.

Ignition.—The generator and ignition system is combined into one unit. The breaker is operated direct from the armature shaft. The centrifugal weights perform the double duty of automatically advancing and retarding the spark in relation to the engine speed, and of closing the timer contacts at the proper time. As these weights are revolved, they bear against the fiber bumper on the contact arm, pushing it down and causing the contact points to be brought together. As the weights are moved further, their bearing surface passes off the fiber bumper, which allows the spring to force contact arm upwards, causing the contacts to be quickly separated. The weights automatically advance the spark as speed increases. The weights are so shaped that they permit the contacts to be closed a greater part of the revolution, as the spark advances, resulting in a uniform spark at all speeds.

Timing.—To time generator to engine, first turn engine until the piston of No. 1 cylinder is on top dead center, both valves closed, then remove distributor plate and turn generator armature back until the mark on the distributor brush holder lines up with the mark on the end bracket. Connect to engine in this position and connect spark plugs to the distributor according to the firing order.

Spark Plug Gaps.—Spark plug gaps should be about .025 inch.

Starter.—Starter is connected to engine through a Bendix drive.

STARTER DATA, FRAME No. 300

Torque	R.P.M.	Amperes
0 lb. ft.	5000	30-40
1 lb. ft.	2600	100
2 lb. ft.	1600	150
3 lb. ft.	1100	190
4 lb. ft.	800	230
5 lb. ft.	500	260
6 lb. ft.	300	290
10.5 lb. ft.	Lock	390

Oiling.—Put several drops of light engine oil in each of the starter oilers every month.

Generator.—Generator charging current regulation is by reverse series field. Current taken by the lights does not flow through this field so has but little effect on the charging rate.

GENERATOR DATA, MODEL No. 230

Speed R. P. M.	Total Output Amperes	Charging Rate Lamps Out. Amperes
400	2	1.0- 1.5
500	5-6	2.5- 3.0
750	10	6.0- 6.5
1000	13	8.5- 9.0
1500	16-17	10.5-11.0
2000	18	11.0-12.0
3000	19	12.0

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Lamps.—Head lamps are 6-8 volts, 15 cp. Dimmer lamps are 6-8 volts, 4 cp. Dash lamp is 6-8 volts, 2 cp. Tail lamp is 6-8 volts, 2 cp.

Fuses.—Small fuses are 5 ampere. Large fuses are 15 ampere.

Glide

Model Six-40 (1916-17) Westinghouse Starting and Lighting System Westinghouse Ignition Cars 9000 to 10255

Battery.—Battery is 6 volt, 85 ampere-hour. The positive (+) terminal is grounded.

Ignition.—Breaker contacts should separate .006 inch to .008 inch. Should they become burned or pitted, resurface them with a fine, jeweler's file. The springs should exert just enough pressure on the distributor brushes to force them $\frac{1}{4}$ inch past the top of the holder when the distributor cap is removed, but should retain them firmly so that they do not tend to fall out. Brushes must move freely in their holders. Be sure that both brushes are in place when replacing the rotor. (There is a brush on both the top and bottom side of the rotor).

Timing.—Contacts should begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position. Contacts are beginning to separate when the end of the distributor rotor is directly opposite the V notch on the rim of the case.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—Spark plug gaps should be about .023 inch.

Ballast Resistor.—There is a ballast resistor in the ignition switch. A fuse must not be permanently substituted for this resistor. In case it is necessary to operate the car with the ballast resistor defective, a 5 ampere fuse may be used temporarily, but the ballast must be replaced as soon as possible, as continued operation without it will result in serious burning of the timer contacts.

Oiling.—Put 2 or 3 drops of light machine oil in the oiler at the side of breaker assembly every month. If car is driven more than 1000 miles in a month, the oiling must be done every 1000 miles.

Starter.—Starter is connected to the engine through a Bendix drive. It should run at 1500 R. P. M., when delivering 2 pound-feet torque. It should deliver 10.5 pound-feet lock torque, taking about 400 amperes. Cold engine, heavy oil, tight bearings or other obstructions, or damp, grounded or short circuited motor windings or commutator bars will cause high current and low speed during the cranking operation.

Oiling.—Refill the wicked oil well under the starter bearings with light machine oil every three months.

Generator.—Generator voltage regulation is by a vibrating regulator. Relay is combined with the regulator. The charging current should be 1 to 1.5 amperes at closing and the discharge current .5 to 1.25 amperes at opening of relay contacts. The air gap between relay armature (moving member) and coil core should be .027 inch to .030 inch. Contacts should separate .013 inch to .017 inch. Adjust by bending brass prongs. Clean relay and regulator contacts by drawing a piece of unglazed paper between them. If badly burned or pitted, resurface them with a piece of well worn No. 00 sand paper, drawing a piece of unglazed paper between them, to remove all grit, and adjust, before again putting into service. Generator should deliver 14 amperes at 7.5 volts.

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Lamps.—Head lamps are 6-8 volts, 17 cp. Dimmer lamps are 6-8 volts, 5 cp. Dash lamp is 6-8 volts, 2 cp. Tail lamp is 6-8 volts, 2 cp. Trouble lamp is 6-8 volts, 2 cp.

Fuses.—Large fuses are 15 ampere. Small fuses are 5 ampere.

Halladay

Model 6-40 (1915)

Westinghouse Starting and Lighting System

Plate No. 284

Battery.—Battery is 6 volt, 100 ampere-hour. The positive (+) terminal is grounded.

Ignition.—The ignition system and generator is combined into one unit. The breaker is operated direct from the armature shaft. The centrifugal weights perform the double duty of automatically advancing and retarding the spark in relation to the engine speed, and of closing the timer contacts at the proper time. As these weights are revolved, they bear against the fiber bumper on the contact arm, pushing it down and causing the contact points to be brought together. As the weights are moved further, their bearing surface passes off the fiber bumper, which allows the spring to force contact arm upwards, causing the contacts to be quickly separated. As the speed increases, the weights are thrown out from the center, and automatically advance the time of opening of the contacts, hence advancing the spark. The weights are so shaped that they permit the contacts to be closed a greater part of the revolution, as the spark advances, resulting in a uniform spark at all speeds.

Adjustment.—When the engine is not running and one of the weights is depressing the fiber bumper, the air gap between the bumper lever and the stop should be $\frac{3}{64}$ of an inch. This distance must be correct before the contact clearance is adjusted. With this distance correct, the contacts should be separated .005 to .008 inch when the contact arm or bumper lever is resting on the stop. Interrupter weights should turn freely on their supporting pins and their surfaces should clear the back of the spring support by .01 inch. After making adjustments, see that both weights depress the contact lever sufficiently that positive connection between the contacts is assured when engine is cranked very slowly by hand. If they do not, there will be a tendency of missing at low speed, especially if contacts are worn or otherwise not in first-class condition. When the weights are in the inner (or retarded) position, the springs should just touch the fiber covered pins without exerting any appreciable pressure on them. If it is necessary to adjust these springs, always do so by bending the supporting arms, not the springs themselves. Distributor brushes should move freely in their holders. The springs should exert just enough pressure on them to force their ends $\frac{1}{2}$ inch from holder. They should be retained by the springs so that they do not tend to fall out. The gears should be so meshed that the mark on the edge of the distributor (large) gear lines up with the tooth on the small gear (on the armature shaft) which is slightly beveled. The two screws holding the distributor plate in place make connection between the ignition coil and the generator. They must both be screwed firmly in place to complete the coil circuit.

Timing.—To time generator to engine, first turn engine until the piston of No. 1 cylinder is on top dead center, both valves closed, then remove distributor plate and turn generator armature back until the mark on the distributor brush holder lines up with the mark on the end bracket. Connect to engine in this position and connect spark plugs to the distributor according to the firing order. Should timer contacts become badly burned or pitted, resurface them with a fine, flat jeweler's file or a strip of worn No. 00 sand paper.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—Spark plug gaps should be about .023 inch.

Starter.—Starter is connected to engine through a Bendix drive. Cold engine, tight bearings, heavy oil or other obstructions or damp, grounded or short circuited motor windings will cause low speed and excessive current during the cranking operation.

Oiling.—Put several drops of light engine oil in each of the starter oilers every month.

Generator.—Generator charging current regulation is by reverse series field. Current taken by the lamps does not flow through the series field, hence has but little effect on the charging rate. Output should be about 15 amperes at 7.2 volts, reached at about 2500 R. P. M. Charging current should be 1 to 1.5 amperes at closing and .5 to 1.25 amperes at opening of relay contacts. The air gap between relay armature (moving member) and coil core should be .027 inch to .030 inch. Contacts should separate .013 inch to .017 inch. Adjust by bending the brass prongs. Clean relay contacts by drawing a piece of unglazed paper between them. If burned or pitted, resurface with a strip of well worn No. 00 sand paper, drawing a piece of unglazed paper between them, to remove all grit, and adjust before again putting into service.

Oiling.—Put several drops of light engine oil in each of the generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Lamps.—Head lamps are 6-8 volts, 18 cp. Side lamps are 6-8 volts, 4 cp. Dash lamp is 6-8 volts, 2 cp. Tail lamp is 6-8 volts, 2 cp.

Model R (1916)

Westinghouse Starting and Lighting System

Westinghouse Ignition

Battery.—Battery is 6 volt, 85 ampere-hour. The positive (+) terminal is grounded.

Ignition.—Breaker contacts should separate .006 inch to .008 inch. Should they become burned or pitted, affecting the ignition, resurface them with a fine, flat jeweler's file. The springs should exert just enough pressure on the distributor brushes to force them $\frac{1}{4}$ inch past the top of the holder when the distributor cap is removed, but should retain them firmly so that they do not tend to fall out. Brushes must move freely in their holders. Be sure that both brushes are in place when replacing the rotor. (There is a brush on both the top and bottom side of the rotor).

Timing.—Contacts should begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position. Contacts are beginning to separate when the end at the distributor rotor is directly opposite the V notch on the rim of the case.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—Spark plug gaps should be about .023 inch.

Ballast Resistor.—There is a ballast resistor in the ignition switch. A fuse must not be permanently substituted for this resistor. In case it is necessary to operate the car with the ballast defective, a 5 ampere fuse may be used temporarily, but the ballast must be replaced as soon as possible, as continued operation without it will result in serious burning of the timer contacts.

Oiling.—Put 2 or 3 drops of light machine oil in the oiler at the side of breaker assembly every two weeks. If car is driven more than 1000 miles in a month, the oiling must be done every 1000 miles.

Starter.—Starter is connected to engine through a Bendix drive. Cold engine, tight bearings, heavy oil or other obstructions, or damp, grounded or short circuited motor winding, or commutator bars will cause low speed and excessive current during the cranking operations.

Oiling.—Put 4 or 5 drops of light engine oil in each of the starter oilers every month.

Generator.—Generator voltage regulation is by a vibrating regulator. Relay is combined with the regulator. The charging current should be 1 to 1.5 amperes at closing and the discharge current .5 to 1.25 amperes at opening of relay contacts. The air gap between relay armature (moving member) and coil core should be .027 inch to .030 inch. Contacts should separate .013 inch to .017 inch. Adjust by bending brass prongs. Clean relay and regulator contacts by drawing a piece of unglazed paper between them. If badly burned or pitted, resurface them with a piece of well worn No. 00 sand paper, drawing a piece of unglazed paper between them, to remove all grit, before again putting into service. Generator should deliver 14-16 amperes at 7.5 volts.

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Lamps.—Head lamps are 6-8 volts, 17 cp. Dimmer lamps are 6-8 volts, 5 cp. Dash lamp is 6-8 volts, 2 cp. Tail lamp is 6-8 volts, 2 cp.

Buick

Model E-6 (1918). (Serial Nos. 343783 to 480995)

Model H-6 (1919). (Serial Nos. 480996 and up)

Model K-6 (1920)

Delco Starting and Lighting System

Delco Ignition

Battery.—Battery is 6 volt, 90 ampere-hour on the 1918 models and 6 volt, 100 ampere-hour on the 1919 and 1920 models. The negative (—) terminal is grounded.

Ignition.—Breaker contacts should separate about .018 inch. They are of tungsten metal. They will operate properly even though very irregular, due to the fact that the rough surfaces fit each other perfectly. Their natural color is dark gray, not silver. Should they become badly burned or pitted, affecting the ignition, remove and resurface them by drawing across a piece of fine emery cloth laid on a flat surface, as on the bed of a drill press, finishing on a very hard oil stone. Clean all oil from contacts before again putting into service.

Timing.—Breaker cam should be so set that when the engine is turned to the seven degree mark on the flywheel (which is about one inch after upper dead center), the contacts will just open when the unit is moved forward as far as the slack in the gears will allow and again close when the breaker is rocked back, with the spark lever in the fully retarded position.

Firing Order.—The firing order is 1, 4, 2, 6, 3, 5.

Spark Plug Gaps.—The spark plug gaps should be .030 inch.

Oiling.—An oiler is provided for lubricating the bearings on the distributor shaft. This should receive 4 or 5 drops of engine oil every week. If rotor button and the track which it follows are not well polished, lubricate with a small amount of vaseline.

Starter-Generator.—Motor and generator are combined within one frame, but are electrically separate, there being two armature and field windings and two commutators. The motor is connected to the flywheel by a non-automatic mechanical shift. Raising and lowering of one motor brush acts as a starting switch. When the ignition switch is closed the generator runs as a motor slowly to facilitate meshing of the starting gears. When the starting pedal is depressed the gears are drawn into mesh, the generator circuit is broken by the raising of the generator brush, and the motor brush is allowed to come into contact with the commutator, thus completing the motor circuit in the order named. There is an over-running clutch to prevent the engine driving the motor. Should the generator fail to motor when the ignition switch is closed, remove the cover from the front of the machine and try to turn the armature. If the armature cannot be turned with the fingers, the clutch is sticking and must be taken down and repaired. If the armature turns freely, look for defective connections at the generator and battery terminals and see that the ignition switch is making proper contact. There is an over-running clutch to allow the generator to run as a motor during the cranking operation or when it is not being driven fast enough to produce a pressure equal to, or greater than that of the battery.

Continued on next page.

Buick

Model E-6 (1918). (Serial Nos. 343783 to 480995)

Model H-6 (1919). (Serial Nos. 480996 and up)

Model K-6 (1920)

Delco Starting and Lighting System

Delco Ignition

Continued from preceding page.

GENERATOR DATA, MODEL No. 117

Cold—Amperes	R. P. M.	Warm—Amperes	R. P. M.
Neutral.....	500	Neutral.....	520
8.0- 9.5.....	825	7.5- 8.5.....	825
12.5-16.....	1500	12.0-15.....	1500
11.0-14.5.....	1800	11.5-14.5.....	1800

Generator current regulation is by third brush method. Position of the third brush is adjustable by means of two screws on bottom of frame. Generator should begin to supply current at 8 miles per hour and reaches its maximum output of about 16 amperes at 20-25 miles per hour. Ammeter indicates amount of charge and discharge.

Oiling.—Put 4 or 5 drops of engine oil in the oiler provided for lubricating the armature shaft every week. The distributor driving gear housing is packed with soft cup grease, which should be replenished every six months. In very cold weather it is advisable to add lubricating oil to soften the grease. The grease cup for the lubrication of the starting gears, shaft and over-running clutch should be given two turns every two weeks.

Circuit-Breaker.—There is a vibrating circuit-breaker to take the place of fuses in the lighting circuit. It should take 25 amperes to start this device vibrating, but a current of 3-5 amperes will cause it to continue vibrating.

Lamps.—The head lamps are 6-8 volts, 18 cp. Dimmer lamps are 6-8 volts, 6 cp. Dash and tail lamps are 6-8 volts, 2 cp. Tonneau lamp is 6-8 volts, 2 cp.

Model Numbers.—Motor-generator is No. 117. Motor clutch is No. 12224. Ignition coil is No. 2157. The combination switch on the E-6 models (1918) is No. 1066 or 1103, on the H-6 models (1919) it is No. 1133, and on the K-6 models (1920) it is No. 1158. Storage battery on the E-6 (1918) models is Exide, type 3-XC-13-1. U. S. L., type HD-313-P is used on the H-6 (1919) models, and Willard, type SJWN-4, on the K-6 (1920) models.

PACKARD

MODEL 2-48 (1913)

BIJUR GENERATING AND LIGHTING SYSTEM

BOSCH IGNITION

BATTERY.—Battery is 6 volt, 80 ampere-hour. The two-wire system is used.

IGNITION.—Dual. Breaker contacts separate .014 to .016 inch. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Put 2 or 3 drops of light machine oil in each of the magneto oilers every two weeks. Put a small amount of vaseline on the fiber bumper of the contact arm, applying with a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 4, 2, 6, 3, 5.

SPARK PLUG GAPS.—Spark plug gaps are .020 to .023 inch.

GENERATOR.—Model D-12. Generator output regulation is by vibrating voltage regulator and a magnetic current-limiting device. Maximum charging rate is 15 amperes, decreasing to 4-5 amperes as the battery becomes charged.

OILING.—Put 5 or 6 drops of light engine oil in the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 8-10 and opens at 6-8 miles per hour. Adjust relay spring tension so that contacts close when voltage of generator reaches 6.5 volts. The adjusting nut cannot be reached by a wrench. Use a small pointed tool. Turn the nut to the right to raise the cut-in voltage. To adjust the voltage regulator, connect a voltmeter across terminals 1 and 2. Then turn the regulator adjusting nut with a socket wrench until the voltage is maintained at 8 volts. The reversing switch on the engine side of the dash must be given one-quarter turn every 500 miles of travel.

LAMPS.—Head lamps are 6-8 volt, 27 cp. Side lamps are 6-8 volt, 7 cp. Dash, speedometer, tail and license-plate lamps are 6-8 volt, 2 cp.

FUSES.—Fuses are 10 ampere.

PACKARD

Maxwell, 1919 (Early), Simms-Huff Starting and Lighting System

SERVICE ENGINEERING COMPANY, SAN FRANCISCO—COPYRIGHTED, 1926

MAXWELL Model 25 (1918 And Early 1919) Simms-Huff Starting and Lighting System Atwater Kent Ignition

Battery.—Battery is 12 volt, 35 ampere hour. The negative (—) terminal is grounded.

Ignition.—Breaker contact should separate .005 inch to .008 inch. They are made of tungsten. They will operate properly though quite rough. Should they become burned or corroded, affecting the ignition, remove and resurface them by drawing across a piece of fine emery cloth laid on a flat surface, as on the bed of a drill press, finishing on a hard oil stone.

Timing.—Break should occur when the upper dead center mark on flywheel is $1\frac{1}{4}$ inches past the indicator, spark lever fully retarded.

Spark Plug Gaps.—The spark plug gaps should be .027 inch to .030 inch.

Firing Order.—The firing order is 1, 3, 4, 2.

Oiling.—Every two weeks put several drops of light engine oil in the oil hole which is exposed when distributor cap is removed. At the same time put a very small amount of vaseline on the cam, applying with a toothpick. If car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

Starter-Generator.—Starter is connected to the engine through a pinion shifted mechanically by the operator. It should develop 24 pound-feet lock torque. Cold engine, heavy oil, tight bearings or other obstructions, or damp, grounded or short circuited windings will cause high current and low speed during the cranking operation. Discharged, dry or sulphated battery, defective battery connections, defective switch contacts, defective starter connections, dirty commutator, high mica, dirty or sticking brushes, defective connections between armature coils and commutator bars or open circuits are the chief causes of low speed and low current.

Generator.—Current regulation is by reverse series field and vibrator regulator. Charging rate should be 12 amperes when running at 1200 R. P. M. Maximum charging rate should be 15 amperes. If the ammeter reading falls off as the engine speed is increased, it is an indication that the belt is slipping and requires adjustment of tension. On generators below No. 27,000, the resistance of the shunt fields should be 6.5 ohms, and on machines with serial numbers above 27,000, it should be 4.8 ohms, providing there are no grounds or short circuits in the windings. Running freely as a motor the unit should draw 7 amperes at 6 volts pressure. Higher current indicates damp, grounded or short circuited windings or mechanical obstructions reducing the speed. Less current indicates defective connections, dirty brushes or dirty commutator.

Oiling.—Put several drops of light engine oil in each of the motor-generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Relay-Regulator.—Relay and regulator are combined and are mounted on the rear of the dash panel. The relay, which is of the indicating type, should close when generator voltage reaches 14 volts. Two carbon contacts operate in parallel with the main relay contacts, which are of copper. It is important that the copper contacts separate before the carbon contacts, so that no arcing can take place at the former. If they do not, "sticking" of the relay or failure to open will result. If maximum output does not come up to 15 amperes at high engine speeds, make certain that generator drive-belt is not slipping and that commutator and brushes are clean and in good contact before adjusting regulator. Charging rate may then be increased by increasing spring tension of regulator armature (moving member). If output exceeds 15 amperes at high speeds, the regulator contacts are not opening as they should and spring tension should be decreased. Clean contacts by drawing a piece of soft paper between them.

Lamps.—Head lamps are 12-16 volt, 21 cp. Tail lamp is 12-16 volt, 2 cp. Dash lamp is 12-16 volt, 2 cp. On 1918 cars head lamps are 12-16 volt, 24 cp.

FUSES.—Fuses are 20 amperes.

Halladay

1915-16

Auto-Lite Starting and Lighting System Connecticut Ignition

Battery.—Battery is 6 volt, 80 ampere-hour. The positive (+) terminal is grounded at the starting motor.

Ignition.—Breaker contacts should separate .023 inch. They are made of tungsten. They will operate properly even though quite rough. Should they become badly worn, affecting the ignition, the inner breaker mechanism should be renewed as directed on Page 50. In an emergency, contacts may be resurfaced enough to give service for 300 or 400 miles by drawing a piece of fine emery cloth between them.

Timing.—Contacts should begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 2, 4, 3.

Spark Plug Gaps.—Spark plug gaps should be .027 inch.

Oiling.—Refill the cup under the breaker head with pure vaseline and turn down every month. If car is driven more than 1000 miles in a month, this must be done every 1000 miles. Do not put grease or oil in the cup.

Starter.—Starter is connected to the engine by a Bendix drive. Cold engine, heavy oil, tight bearings or other obstructions, or damp, grounded or short circuited windings will cause high current and low speed during the cranking operation. Discharged, dry or sulphated battery, defective battery connections, defective switch contacts, defective starter connections, dirty commutator, high mica, dirty or sticking brushes, defective connections between armature coils and commutator bars or open circuits are the chief causes of low speed and low current.

Oiling.—Starter bearings are packed with grease. Renew grease every six months. No oil is required.

Generator.—Generator current regulation is by reverse series field.

Amperes	GENERATOR DATA, MODEL GG	R. P. M.
5.0		750-860
10.0		1225-1400
12.5		1600-1825
15.0		2175-2450
17.0-18		3200-3700

A variation of 1.5 amperes in these readings is allowable. Output may be changed slightly by changing brush pressure. Brush pressure should be 1 to 1 1/4 pounds. When operating freely as a motor, generator should take 2.8 amperes, armature revolving at 350 R. P. M. Much higher speed indicates damp, grounded or short circuited field coils. Greater current and lower speed indicates tight bearings, or damp, grounded or short circuited armature windings or commutator. Shunt field should take 1.1 amperes.

Oiling.—Put 4 or 5 drops of light engine oil in each of the generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Relay.—Relay should close at 500-575 R. P. M. of generator armature. Charging current should be .5 to 1.5 amperes at closing, and discharge current 0 to 1 ampere at opening of relay contacts. Clean relay contacts by drawing a piece of unglazed paper between them. If badly burned or pitted, resurface with a strip of well worn No. 00 sand paper, drawing a piece of unglazed paper between them to remove all grit. Adjust before again putting into service.

Lamps.—Head lamps are 6-8 volt, 18 cp. Side lamps are 6-8 volt, 4 cp. Dash lamp is 6-8 volt, 2 cp. Tail lamp is 6-8 volt, 2 cp.

PREMIER Model 6-B And 6-C (1917-18-19) DELCO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

Battery:—(1917-18) 6 volt, 100 ampere-hour. (1919) 6 volt, 120 ampere-hour. The negative (-) terminal is grounded.

Ignition.—Breaker contacts should separate .018 inch. They are made of tungsten. They will operate properly even though very irregular, due to the fact that the rough surfaces fit each other perfectly. Their natural color is dark grey, not silver. Should they become badly burned or pitted, affecting the ignition, remove and resurface them by drawing across a piece of fine emery cloth laid on a flat surface, as on the bed of a drill press, finishing on a very hard oil stone. Clean all oil from contacts before again putting into service.

Timing.—Contacts should begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—Spark plug gaps should be .025 inch to .028 inch.

Oiling.—Put 3 or 4 drops of light engine oil in distributor oilers every week. If car is driven more than 250 miles in a week, the oiling must be done every 250 miles.

Starter.—Starting motor is No. 110. It is connected to the engine by a Bendix drive and should deliver at least 16 pound feet lock torque. When running free it should not take over 40 amperes at 3.5 to 3.8 volts. Excessive current indicates damp, grounded or short circuited motor windings or commutator bars, tight bearings or armature striking pole pieces. Discharged, dry or sulphated battery, defective battery connections, defective switch contacts, defective starter connections, dirty commutator, high mica, dirty or sticking brushes, defective connections between armature coils and commutator bars, or open circuits are the chief causes of low speed and current. Starter rotates clockwise, viewed from driving end.

Oiling.—Starter requires absolutely no oil.

Generator.—Generator current regulation is by third brush system. There is no relay. Circuit between generator and battery is controlled by the ignition switch.

Cold		Warm	
Amperes	R. P. M.	Amperes	R. P. M.
Neutral.....	500	Neutral.....	500
10.5.....	900	10-12.....	900
15.5-18.....	1400	14-16.....	1400
13 - 17.....	2000	11-13.....	2000

Generator rotates clockwise when viewed from driving end.

Oiling.—Put several drops of light engine oil in each of the generator bearing oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Lamps.—Head lamps are 6-8 volts, 21 cp. Dimmer lamps are 6-8 volts, 4 cp. Dash lamp is 6-8 volts, 2 cp. Tonneau lamp is 6-8 volts, 2 cp. Tail lamp is 6-8 volts, 2 cp.

Circuit Breaker.—There is a vibrating circuit breaker in the lighting circuit to take the place of fuses. A current of 25 amperes is required to start this device vibrating, but 3 to 5 amperes will cause it to continue vibrating.

Jones

(1915)

**Leece-Neville Starting and Lighting System
Remy Battery Ignition**

Battery.—Battery is 6 volt, 100 ampere-hour. The negative (—) terminal is grounded.

Ignition.—Breaker contacts should separate .020 inch to .025 inch. If burned or pitted, affecting the ignition, resurface them with a very fine, flat jeweler's file or a strip of worn No. 00 sand paper.

Timing.—Contacts should begin to separate when piston entering power stroke is on top dead center, spark control lever in the fully retarded position. First see that breaker assembly is fully retarded when lever is in the fully retarded position.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—The spark plug gaps should be .020 to .025 inch.

Oiling.—A grease cup with wick feed is provided for lubricating the distributor bearings. This cup is filled with vaseline which should be replenished every month. At the same time put a small amount of vaseline on the fiber bumper of the contact arm, using a toothpick. If the car is driven more than 1000 miles in a month, these attentions should be given every 1000 miles.

Starter.—Starter is connected to engine through a chain drive and overrunning clutch. Cold engine, heavy oil, tight bearings or other obstructions, or damp, grounded or short circuited windings will cause high current and low speed during the cranking operation. Discharged, dry or sulphated battery, defective battery connections, defective switch contacts, defective starter connections, dirty commutator, high mica, dirty or sticking brushes, defective connections between armature coils and commutator bars or open circuits are the chief causes of low speed and low current.

Oiling.—Starter gear box is packed with soft cup grease which should be renewed every six months. Put 5 or 6 drops of light engine oil in the oiler on the opposite end every month.

Generator.—Generator current regulation is by third brush method. Maximum charging rate should be 15 amperes at 20 miles per hour. Position of third brush is adjustable by loosening the screw at right side of commutator end. Move upward to increase charging rate and downward to decrease.

Oiling.—Generator bearing and distributor drive are packed with soft cup grease, which should be renewed every six months. Every two weeks put 4 or 5 drops of light engine oil in the commutator end bearing. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Relay.—Relay should close at 8-10 miles per hour and open at 6-8 miles per hour. Clean relay contacts by drawing a piece of unglazed paper between them. If badly burned or pitted, resurface with a strip of well worn No. 00 sand paper, drawing a piece of unglazed paper between them to remove all grit. Adjust before again putting into service.

Lamps.—Head lamps are 6-7 volt, 15 cp. Dimmer lamps are 6-7 volt, 4 cp. Tail lamp is 6-7 volt, 2 cp.

1914-1915
GRAY-DAVIS STARTING & LIGHTING SYSTEM
BOSCH MAGNETO IGNITION

Plate No. 294

- Battery.**—Battery is 6 volt, 145 ampere-hour. The positive (+) terminal is grounded.
- Ignition.**—Magneto breaker contacts should separate .014 to .016 inch. Should they become badly burned or pitted, affecting the ignition, resurface them with a fine, flat jeweler's file or a strip of worn No. 00 sand paper.
- Timing.**—Breaker contacts should just begin to separate when piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.
- Firing Order.**—Firing order of the 4 cylinder cars is 1, 3, 4, 2, and of the 6 cylinder cars 1, 5, 3, 6, 2, 4.
- Oiling.**—Put 2 or 3 drops of light engine oil in each of the magneto oilers every two weeks. At the same time put a very small amount of vaseline on the fibre bumper of the contact arm, applying with a toothpick. If car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.
- Starter.**—Starter is connected to the engine through a pinion shifted by the operator. Starter should draw 150 amperes at 6 volts when running at 1500 R. P. M. Cold engine, heavy oil, tight bearings or other obstructions, or damp, grounded or short circuited windings will cause high current and low speed during the cranking operation. Discharged, dry or sulphated battery, defective battery connections, defective switch contacts, defective starter connections, dirty commutator, high mica, dirty or sticking brushes, defective connections between armature coils and commutator bars or open circuits are the chief causes of low speed and low current.
- Oiling.**—Lubricate sliding parts and bearings with light engine oil once a week. Thoroughly clean out and repack starter bearings with soft cup grease every six months.
- Generator.**—Generator output regulation is by mechanical speed control. The governor is of the shoe and shell type, and should be so adjusted that the armature is driven at 1000 R. P. M., when the engine is running at a speed equivalent to ten miles per hour. The speed of the armature should remain constant at that point, regardless of increased engine speed. When driven at 1000 R. P. M. generator should deliver 9 amperes at 6½ volts. Charging rate will vary with condition of battery. At a speed of 12 miles per hour, with all lights on, ammeter should indicate ½ to 2 amperes "Charge", and with lights off from 3 to 8 amperes. The governor is adjustable by means of a screw which is accessible through openings in the shoes and shell. These openings must first be brought into alignment with each other. A narrow screw driver may then be inserted. Turn the adjusting screw to the right to increase output of the generator, and to the left to decrease output. The generator operates as a simple shunt-wound machine except when supplying current to the lights, when it is compounded to increase the output. In case the governor mechanism is worn out, the generator's connections may be altered so as to give reverse series field current regulation. To make this change follow instructions given on page 188.
- Oiling.**—Put 6 or 8 drops of light engine oil in the bearings at driving end and commutator end and center bearing of generator every two weeks. On machines still using the clutch the governor arm bearings must be oiled with light engine oil at the same time. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.
- Relay.**—Relay should close at 10-12 miles per hour, and open at 8-10 miles per hour. Clean relay contacts by drawing a piece of unglazed paper between them. If badly burned or pitted, resurface with a strip of worn No. 00 sandpaper, drawing a piece of unglazed paper between them to remove all grit. Adjust before again putting into service.
- Lamps.**—Head lamps are 6-8 volts, 15 cp. Side lamps are 6-8 volts, 6 cp. Dash lamp is 6-8 volts, 2 cp. Tonneau lamp is 6-8 volts, 2 cp. Trouble lamp is 6-8 volts, 2 cp. Tail lamp is 6-8 volt, 2 cp.
- Fuses.**—Fuses are 10 ampere.
- Mod 1 Numbers.**—Generator is Type G-1. Starter is type H-1.

Jones

(1916)

Gray and Davis Starting and Lighting System Remy Battery Ignition

Battery.—Battery is 6 volt, 85 ampere-hour. The positive (+) terminal is grounded.

Ignition.—Breaker contacts should separate .020 to .025 inch. If burned or pitted, affecting the ignition, resurface them with a very fine flat jeweler's file or a strip of worn No. 00 sand paper.

Timing.—Contacts should just begin to separate when piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—The spark plug gaps should be .020 to .025 inch.

Oiling.—The grease cup under the breaker head should be kept full of soft cup grease and tightened every 500 miles. In case the oiler is provided with a wick, use pure vaseline instead of cup grease.

Starter.—Starter is connected to the engine through a pinion shifted by the operator, a set of reduction gears with ratio 49 to 14, and an overrunning clutch. Starter, when running free, should draw 35 amperes at 6 volts, turning at 7000 R. P. M. It should deliver 1½ pound-feet torque at 2400 R. P. M., drawing 137 amperes at 5¾ volts pressure. Cold engine, heavy oil, tight bearings or other obstructions, or damp, grounded or short circuited windings will cause high current and low speed during the cranking operation. Discharged, dry or sulphated battery, defective battery connections, defective switch contacts, defective starter connections, dirty commutator, high mica, dirty or sticking brushes, defective connections between armature coils and commutator bars or open circuits are the chief causes of low speed and low current.

Oiling.—Every two weeks put 4 or 5 drops of light engine oil in the commutator-end oiler and oilers at each end of intermediate shaft. Every three months remove plug in starter gear case and put in one tablespoonful of heavy engine oil. The sliding surfaces of the starting mechanism must be oiled once a week.

Generator.—Generator output regulation is by a vibrating regulator. Generator should deliver 10 amperes at 6½ volts when driven 1000 R. P. M., which corresponds to a car speed of 10 miles per hour. Output will vary slightly with battery condition. When running at 12 miles per hour or over, ammeter should indicate 6 to 9 amperes "Charge" with lamps off and ½ to 2½ amperes with lights on.

Oiling.—Put 8 to 10 drops of light engine oil in each of the generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Relay-Regulator.—Relay is combined with regulator. Relay should close when generator voltage reaches 6 to 6½ volts, and open when discharge current from battery reaches ½ to 2 amperes. Clean relay and regulator contacts by drawing a piece of unglazed paper between them. If badly burned or pitted, resurface with a strip of well worn No. 00 sand paper, drawing a piece of unglazed paper between them to remove all grit. Adjust before again putting into service. To adjust regulator, hold one set of contacts apart and adjust the other set until the desired output is obtained. Then hold the first set apart and adjust the other set in the same way. Then allow both sets to operate together. Increasing spring tension will increase output, and decreasing spring tension will decrease output. Do not increase output above 11 amperes. Generator output should be driven at 1750 R. P. M., while regulator is being adjusted.

Lamps.—Head lamps are 6-8 volts, 15 cp. Dimmer lamps are 6-8 volts, 5 cp. Dash and tail lamps are 6-8 volt, 2 cp.

Mod 1 Numbrs.—Generator is Type T. Starter is No. 136. Ignition coil is No. 175A. Ignition distributor is No. 203A. Ignition switch is No. 192A.

Dixie-Flyer

1916 (Cars below Serial No. 2200)
Dyn to Starting and Lighting System
Connecticut Ignition

Battery.—Battery is 12 volt, 60 ampere-hour. The two wire system is used.

Ignition.—Breaker contacts should separate .023 inch. They are made of tungsten. They will operate properly even though quite rough. Should they become badly worn, affecting the ignition, the inner breaker mechanism should be renewed as directed on Page 50. In an emergency, contacts may be resurfaced enough to give service for 300 or 400 miles by drawing a piece of fine emery cloth between them.

Timing.—Breaker contacts should begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plug Gaps.—Spark plug gaps should be .025 inch to .027 inch.

Oiling.—Refill the cup under the breaker head with pure vaseline and turn down every month. If car is driven more than 1000 miles in a month, this must be done every 1000 miles. Do not put grease or oil in the cup.

Starter-Generator.—Starter and generator are combined to form a single unit. It is chain connected to engine crank shaft.

STARTER DATA, MODEL B

Torque	R. P. M.	Amperes	Volts
5 lb. ft.	410	40	11.8
10 lb. ft.	310	65	11.5
15 lb. ft.	240	90	11.1
20 lb. ft.	175	115	10.8
25 lb. ft.	120	130	10.5
30 lb. ft.	75	160	10.2
35 lb. ft.	40	180	9.9
40 lb. ft.	Lock	210	9.6

Cold engine, heavy oil, tight bearings or other obstructions, or damp, grounded or short circuited windings will cause high current and low speed during the cranking operation. Discharged, dry or sulphated battery, defective battery connections, defective switch contacts, defective starter connections, dirty commutator, high mica, dirty or sticking brushes, defective connections between armature coils and commutator bars or open circuits are the chief causes of low speed and low current.

Generator.—The unit operates as a generator when its pressure is greater than that of the battery. Current regulation is by reverse series field. There is no relay, the circuit between the generator and battery being controlled by the starting switch. Starting switch has three positions marked "On" and "Neutral" or "Touring". In the "On" position, ignition circuit and the circuit between starter-generator and battery is completed. In the "Off" position, starter-generator and ignition circuits are broken. When in the "Neutral" or "Touring" position, the ignition circuit is completed and generator is disconnected from the battery and the shunt field is broken, rendering generator inoperative. This position is to be used on long runs with battery fully charged, to prevent overcharging. Generator should begin to supply current at 900 R. P. M. of armature, or 7-8 miles per hour. Generator output should be 5 amperes at 1150-1200 R. P. M., and 10 amperes at 1400-1600 R. P. M.

GENERATOR DATA, MODEL B

Dyneto Starting and Lighting System

Connecticut Ignition

Battery—Battery is 6 volt, 108.5 ampere-hour. The two wire system is used.

Ignition—Breaker contacts separate .023 inch. They are made of tungsten. They will operate properly even though quite rough. Should they become badly worn, affecting the ignition, the inner breaker mechanism should be renewed as directed on Page 50. In an emergency, contacts may be resurfaced enough to give service for 300 or 400 miles by drawing a piece of fine emery cloth between them.

Timing—Contacts should begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

Firing Order—The firing order is 1, 3, 4, 2.

Spark Plug Gaps—Spark plug gaps should be .025 inch to .027 inch.

Oiling—Refill the cup under the breaker head with pure vaseline and turn down every month. If car is driven more than 1000 miles in a month, this must be done every 1000 miles. Do not put grease or oil in the cup.

Starter—Starter is connected to engine through a Bendix drive.

STARTER DATA, MODEL UA

Torque	R. P. M.	Amperes	Volts
2.5	1320	150	5.2
5.0	620	280	4.8
7.5	300	380	4.5
10.0	Lock	500	3.8

A 6 volt, 180 ampere-hour battery having specific gravity reading of 1.250 or above, should be used in making these tests. Cold engine, heavy oil, tight bearings or other obstructions, or damp, grounded or short circuited windings will cause high current and low speed during the cranking operation. Discharged, dry or sulphated battery, defective battery connections, defective switch contacts, defective starter connections, dirty commutator, high mica, dirty or sticking brushes, defective connections between armature coils and commutator bars or open circuits are the chief causes of low speed and low current.

Oiling—Starter bearings are inlaid with graphite so do not require much oil. There is a felt washer at the commutator end which should receive a quantity of light machine oil every three months. At the other end there is a hole provided with a felt wick. Put several drops of light machine or engine oil on this wick every three months.

Generator—Generator current regulation is by a vibrating regulator.

Amperes	GENERATOR DATA, MODEL VA	M. P. H.
2.5		9
5.0		10
7.5		12
10.0		14
12.0		15
10.0		45

Damp, grounded or short circuited armature or field windings, sticking brushes, dirty commutator, high mica, defective connections or dirty or corroded regulator contacts are the chief causes of low current. Sticking of regulator contacts or resistance unit shorted out, will cause output to continue to rise as speed increases, after the normal maximum is reached.

Oiling—Generator bearings are inlaid with graphite so do not require a great amount of oil. There is a felt washer at the commutator end and a hole provided with a felt wick at the other end. Keep these well oiled at all times, but do not over saturate them.

Relay Regulator—Relay should close at 8 miles per hour and open at 6 miles per hour. Clean relay and regulator contacts by drawing a piece of unglazed paper between them. If badly burned or pitted, resurface them with a piece of well worn No. 00 sand paper, drawing a piece of unglazed paper between them, to remove all grit, and adjust before again putting into service. Increasing spring tension on regulator armature (moving member) will increase the output. Decreasing the spring tension will decrease the output.

Lamps—Head lamps are 6-8 volt, 17 cp. Dash lamp is 6-8 volt, 2 cp. Tail lamp is 6-8 volt, 2 cp.

Fuses—Fuses are 20 ampere.

Plate No. 297

Plate No. 298

Stearns

Light 4 (1915). (Serial Nos. L-1 to L-703) Gray and Davis Starting and Lighting System Bosch Magneto Ignition

Battery.—Battery is 12 volt, 64 ampere-hour. The positive terminal of one set of 3 cell is grounded through the ammeter.

Ignition.—Magneto is Type NU4. Breaker contacts should separate .014 inch to .016 inch. Should they become badly burned or pitted, affecting the ignition, resurface them with a fine, flat jeweler's file or a piece of well worn No. 00 sandpaper.

Timing.—Magneto breaker contacts should begin to separate when engine is turned $1\frac{1}{2}$ inches past upper dead center, measured on flywheel, with spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plug Gaps.—The spark plug gaps should be .018 to .02 inch.

Oiling.—Put 3 or 4 drops of light machine oil in each of the magneto oilers every two weeks. At the same time put a small amount of vaseline on the fiber bumper of the contact arm, applying with a toothpick. If car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

Starter.—Starter is Type T. It is connected to the engine through a set of reduction gears and a pinion shifted by the operator. An overrunning clutch prevents the engine from driving the motor at an excessive speed. The starting switch connects the two halves of the battery in series for starting, applying 12 volts pressure to the motor. Cold engine, heavy oil, tight bearings or other obstructions, or damp, grounded or short circuited windings will cause high current and low speed during the cranking operation. Discharged, dry or sulphated battery, defective battery connections, defective switch contacts, defective starter connections, dirty commutator, high mica, dirty or sticking brushes, defective connections between armature coils and commutator bars or open circuits are the chief causes of low speed and low current.

Oiling.—Every two weeks put 4 or 5 drops of light oil in the commutator end oiler and oilers at each end of intermediate shaft. Every three months remove plug in starter gear case and put in one tablespoonful of heavy engine oil. The sliding surfaces of the starting mechanism must be lubricated once a week.

Generator.—Generator output regulation is by vibrating regulator. The two halves of the battery are connected in parallel for charging. Generator should deliver 10 amperes at $6\frac{1}{2}$ volts when driven 1000 R. P. M., which corresponds to a car speed of 10 miles per hour. Output will vary slightly with battery condition. When running at 12 miles per hour or over, ammeter should indicate 6 to 10 amperes "Charge", with lamps off, and $\frac{1}{2}$ to $2\frac{1}{2}$ amperes with lamps on.

Oiling.—Put 8 to 10 drops of light engine oil in each of the generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Relay-Regulator.—Relay is combined with regulator. Relay should close when generator pressure reaches 6 to $6\frac{1}{2}$ volts, and open when discharge current from battery reaches $\frac{1}{2}$ to 2 amperes. It should close at 10 miles per hour, and open at 8 miles per hour. Clean relay-regulator contacts by drawing a piece of unglazed paper between them. If badly burned or pitted, resurface with a strip of well worn No. 00 sandpaper, and then draw a piece of unglazed paper between them to remove all grit. Adjust before again putting into service. To adjust regulator, hold one set of contacts apart and adjust the other set until the desired output is obtained. Then hold the first set apart and adjust the other set in the same way. Then allow both sets to operate together. Increasing spring tension will increase output, and decreasing spring tension will decrease output. Do not increase maximum output above 11 amperes. Generator armature should be driven at 1750 R. P. M., while regulator is being adjusted.

Lamps.—Head lamps are 6-8 volt, 15 cp. Dimmer lamps are 6-8 volt, 4 cp. Tail and dash lamps are 6-8 volt, 2 cp.

Auburn

1916

Auto-Lite Starting and Lighting System Connecticut Ignition

Battery.—Battery is 6 volt, 80 ampere-hour. The negative (—) terminal is grounded at the starting motor.

Ignition.—Breaker contacts should separate .023 inch. They are made of tungsten. They will operate properly even though quite rough. Should they become badly worn, affecting the ignition, the inner breaker mechanism should be renewed as directed on Page 50. In an emergency, contacts may be resurfaced enough to give service for 300 or 400 miles by drawing a piece of fine emery cloth between them.

Timing.—Contacts should begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order of the four cylinder cars is 1, 3, 4, 2. The firing order of the six cylinder cars is 1, 4, 2, 6, 3, 5.

Spark Plug Gaps.—Spark plug gaps should be .023 inch.

Oiling.—Refill the cup under the breaker head with pure vaseline and turn down every month. If car is driven more than 1000 miles in a month, this must be done every 1000 miles. Do not put grease or oil in the cup.

Starter.—Starter is connected to engine through a Bendix drive.

STARTER DATA, MODEL MC

Torque	Amperes	R. P. M.
0 lb. ft.	50-55	4270
1 lb. ft.	100-105	2650
2 lb. ft.	145-150	1900
3 lb. ft.	185-190	1600
4 lb. ft.	225-230	1400
5 lb. ft.	250-255	1250
6 lb. ft.	290-300	1000
16 lb. ft.	450-460	Lock

Starter should deliver 16 pound-feet lock torque, taking 450-460 amperes at 4.2 volts.

Cold engine, heavy oil, tight bearings or other obstructions, or damp, grounded or short circuited windings will cause high current and low speed during the cranking operation. Discharged, dry or sulphated battery, defective battery connections, defective switch contacts, defective starter connections, dirty commutator, high mica, dirty or sticking brushes, defective connections between armature coils and commutator bars or open circuits are the chief causes of low speed and low current.

Oiling.—Starter bearings are packed with grease. Thoroughly clean out and repack them with soft cup or ball bearing grease every six months. No oil is required.

Generator.—Generator current regulation is by reverse series field.

Amperes	GENERATOR DATA, MODEL GF	R. P. M.
5.0		430-490
10.0		730-870
12.5		945-1180
15.0		1225-1660
16.0-19		2400-2800

When operating freely as a motor, generator should take 1.8 amperes, armature revolving at 200 R. P. M. Much higher speed indicates damp, grounded or short circuited field coils. Greater current or lower speed indicates tight bearings or damp, grounded or short circuited armature windings or commutator. Shunt field should take 1 ampere.

Relay.—Relay should close at 230-265 R. P. M., of generator armature. Charging current should be .5 to 1.5 amperes at closing, and discharge current 0 to 1 ampere at opening of relay contacts. Clean contacts by drawing a piece of unglazed paper between them. If badly burned or pitted, resurface with a strip of worn No. 00 sand paper. Draw a piece of unglazed paper between them to remove all grit. Adjust before putting into service.

Oiling.—Put several drops of light engine oil in each of the generator oilers every two weeks. If car is driven more than 500 miles in two weeks, oil every 500 miles.

Lamps.—Head lamps are 6-8 volts, 15 cp. Dimmer lamps are 6-8 volts, 4 cp. Dash lamp is 6-8 volts, 2 cp. Tail lamp is 6-8 volts, 2 cp.

Plate No. 300

Cole

Model 860 (1917) (Serial Nos. 40,000 to 50,000)
Delco Starting and Lighting System
Delco Ignition

Battery.—Battery is 6 volt, 100 ampere-hour. The negative (—) terminal is grounded.

Ignition.—Breaker contacts should separate .018 inch. They are made of tungsten. They will operate properly even though very irregular, due to the fact that the rough surfaces fit each other perfectly. Their natural color is dark gray, not silver. Should they become badly burned or pitted, affecting the ignition, remove and resurface them by drawing across a piece of fine emery cloth laid on a flat surface, as on the bed of a drill press, finishing on a very hard oil stone. Clean all oil from contacts before again putting into service.

Timing.—Breaker contacts should separate when piston entering power stroke is on top dead center, spark control lever and breaker assembly in fully retarded position.

Firing Order.—The firing order is 1R, 4L, 2R, 3L, 4R, 1L, 3R, 2L.

Spark Plug Gaps.—Spark plug gaps should be .028 inch to .030 inch.

Oiling.—Put 4 or 5 drops of light engine oil in oil hole on side of distributor housing every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Starter.—Starter is model No. 72. It is connected to the engine through a Bendix drive. Running freely, starter should draw about 40 amperes. It should deliver 17.5 pound-foot lock torque, with a line voltage of 3.5-3.8 volts. Cold engine, heavy oil, tight bearings or other obstructions, or damp, grounded or short circuited windings will cause high current and low speed during the cranking operation. Discharged, dry or sulphated battery, defective battery connections, defective switch contacts, defective starter connections dirty commutator, high mica, dirty or sticking brushes, defective connections between armature coils and commutator bars or open circuits are the chief causes of low speed and low current.

Oiling.—Starter bearings are of the oilless type and require no lubrication.

Generator.—Generator current regulation is by third brush method.

GENERATOR DATA, MODEL NO. 91

Cold-Amperes	R. P. M.	Warm-Amperes	R. P. M.
Neutral.....	625	Neutral.....	650
5.0-7.....	800	4.0-6.....	800
9.5-13.....	1000	8.5-11.....	1000
15.0-19.....	1600	14.0-18.....	1600
17.0-21.....	1800	14.0-20.....	1800
16.0-21.....	2000	16.0-20.....	2000

To adjust charging rate, loosen the two screws which hold third brush arm. Move to the right to increase charging rate and to the left to decrease. Maximum output should not exceed 20 amperes at 20-25 miles per hour.

Oiling.—Put 6 or 8 drops of light engine oil in the oil hole at forward end of generator and in oil cup at commutator end every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Relay.—There is no relay. The circuit between the generator and battery is controlled by the ignition switch.

Lamps.—Head lamps are 6-8 volt, 17 cp. Dash and tail lamps are in series and are each 3.4 volt, 2 cp.

Circuit Breaker.—There is a vibrating circuit breaker in the lighting circuit to take the place of fuses. It requires a current of 25 amperes to start this device vibrating, but a current of 3 to 5 amperes will cause it to continue.

Model Numbers.—Starter is No. 72. Generator is No. 91. Starting switch is No. 1963. Distributor is No. 5153. Ignition coil is No. 2123. Combination switch is No. 1067.

Plate No. 301

Paige

Model 6-51 (1917)

Gray and Davis Starting and Lighting System (Type 250 Generator with Vibrator Regulator)

Remy Ignition

Battery.—Battery is 6 volt, 100 ampere-hour. The positive (+) terminal is grounded.

Ignition.—Breaker contacts should separate .020 inch to .025 inch. Should they become badly burned or pitted, affecting the ignition, resurface them with a fine, flat jeweler's file or a piece of worn No. 00 sand paper.

Timing.—Contacts should begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in fully retarded position.

Firing Order.—Firing order should be 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—The spark plug gaps should be .025 inch.

Oiling.—Refill the cup under the distributor head with soft cup grease and turn down two turns every two weeks. At the same time put a small amount of vaseline on the fiber bumper of the contact arm, using a toothpick. If the car is driven more than 500 miles in two weeks, these attentions should be given every 500 miles.

Starter.—Starter is Type 120. It is connected to the engine through a Bendix drive. Starter should run at 2200 R. P. M., when taking 35 amperes at 3 volts pressure. It should run at 4500 R. P. M., with the same current under 5.5 volts, and at 5000 R. P. M., with 6 volts. It should deliver 1½ pound-feet torque, when running at 1600 R. P. M., and drawing 100 amperes. Cold engine, heavy oil, tight bearings or other obstructions, or damp, grounded or short circuited windings will cause high current and low speed during the cranking operation. Discharged, dry or sulphated battery, defective battery connections, defective switch contacts, defective starter connections, dirty commutator, high mica, dirty or sticking brushes, defective connections between armature coils and commutator bars or open circuits are the chief causes of low speed and low current. Minimum pressure of motor brushes on commutator should be 2¼ pounds.

Oiling.—Put 4 or 5 drops of light machine oil in each of the starter bearing oilers every month.

Generator.—Type 250 generator is used. Voltage regulation is by vibrating regulator. Normal maximum output should be 10 amperes at 700 R. P. M. With a 7½ ampere lamp load the charging current to battery should be 1-4.5 amperes. The total output, with 7½ ampere lamp load, should be 8.5 to 11 amperes. Charging rate will vary with condition of battery, being highest when battery is discharged and decreasing as the specific gravity rises. When operating freely as a motor, the generator should run at 335 R. P. M., drawing 3 amperes at a pressure of 6 volts. Shunt field should take 2.04 to 2.30 amperes at 6 volts.

Oiling.—Put 4 or 5 drops of light machine oil in each of the generator bearing oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Relay-Regulator.—Relay is combined with regulator. Relay should close at 12 miles per hour. Charging current should be 9 amperes at closing. Relay contacts should separate .015 inch. Relay is adjustable by means of a knurled screw, which increases or decreases air gap. Regulator is adjusted in the same manner, by means of a screw at the opposite end of the relay-regulator. Turn to the right to increase the air gap and the maximum output of generator. Turn to the left to decrease the air gap and output. Minimum air gap between regulator armature (moving member) and coil core should be .045 inch. Clean relay-regulator contacts by drawing a piece of unglazed paper between them. If badly burned or pitted, resurface with a strip of worn No. 00 sand paper, and then draw a piece of unglazed paper between them to remove all grit. Adjust before again putting into service.

Lamps.—Head lamps are 6-8 volt, 15 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp.

- Battery.**—Battery is 6 volt, 100 ampere-hour. The positive (+) terminal is grounded.
- Ignition.**—Breaker contacts separate .020 inch to .025 inch. Should they become badly turned or pitted, affecting the ignition, resurface them with a fine, flat jeweler's file, or a piece of worn No. 00 sand paper.
- Timing.**—Contacts should begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.
- Firing Order.**—The firing order is 1, 5, 3, 6, 2, 4.
- Spark Plug Gaps.**—Spark plug gaps should be .025 inch.
- Oiling.**—Refill the cup under the distributor head with soft cup grease and turn down two turns every two weeks. At the same time put a small amount of vaseline on the fiber bumper of the contact arm, using a toothpick. If the car is driven more than 500 miles in two weeks, these attentions should be given every 500 miles.
- Starter.**—Starter is Type 120. It is connected to the engine through a Bendix drive. Starter should run at 2200 R. P. M., when taking 35 amperes at 3 volts pressure. It should run at 4500 R. P. M., with the same current under 5.5 volts, and at 5000 R. P. M., with 6 volts. It should deliver 1½ pound-feet torque, when running at 1600 R. P. M., and drawing 100 amperes. Cold engine, heavy oil, tight bearings or other obstructions, or damp, grounded or short circuited windings will cause high current and low speed during the cranking operation. Discharged, dry or sulphated battery, defective battery connections, defective switch contacts, defective starter connections, dirty commutator, high mica, dirty or sticking brushes, defective connections between armature coils and commutator bars or open circuits are the chief causes of low speed and low current. Pressure of motor brushes on commutator should be 2¼ pounds.
- Oiling.**—Put 4 or 5 drops of light machine oil in each of the starter bearing rollers every month.

Generator.—Type 400 generator is used. Current regulation is by third brush method.

Amperes	GENERATOR DATA, TYPE 400	R. P. M.
2		480
4		530
6		590
8		650

14		1700
12		2400

Generator is driven at 1½ times engine speed. Position of third brush is adjustable by means of a rack and pinion movement operated by turning a screw accessible through an opening in the end plate. Turn screw to the right (clockwise) to increase the charging rate, or to the left (anti-clockwise) to decrease the charging rate.

Oiling.—Put 4 or 5 drops of light machine oil in each of the generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Relay.—Relay should close when voltage of generator reaches 6.25 to 7.25 volts, and open when reverse current reaches 0 to 2 amperes. Relay contacts should separate .015 inch. Minimum air gap between armature (moving member) and coil core should be .020 inch. Clean relay contacts by drawing a piece of unglazed paper between them. If badly burned or pitted, resurface with a strip of well worn No. 00 sand paper, and then draw a piece of unglazed paper between them, to remove all grit. Adjust before again putting into service.

Lamps.—Head lamps are 6-8 volt, 15 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp.

Model 870 (1918) (Serial Nos. 50,001 to 51,000)

Delco Starting and Lighting System

Delco Ignition

Battery.—Battery is 6 volt, 125 ampere-hour. The negative (—) terminal is grounded.

Ignition.—Breaker contacts should separate .018 inch. They are made of tungsten. They will operate properly even though very irregular, due to the fact that the rough surfaces fit each other perfectly. Should they become badly burned or pitted, affecting the ignition, remove and resurface them by drawing across a piece of fine emery cloth laid on a flat surface, as on the bed of a drill press, finishing on a very hard oil stone. Clean all oil from contacts before again putting into service.

Timing.—Breaker contacts should separate when piston entering power stroke in on top dead center, spark control lever and breaker assembly in fully retarded position.

Firing Order.—The firing order is 1R, 4L, 2R, 3L, 4R, 1L, 3R, 2L.

Spark Plug Gaps.—The spark plug gaps should be .028 inch to .030 inch.

Oiling.—Put 4 or 5 drops of light engine oil in oil hole on side of distributor housing every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Starter.—Starter is Model 72. It is connected to the engine through a Bendix drive. Running freely, starter should draw 40 amperes. It should deliver 17.5 pound-feet lock torque, with a line voltage of 3.5-3.8 volts. Cold engine, heavy oil, tight bearings or other obstructions or damp, grounded or short circuited windings will cause high current and low speed during the cranking operation. Discharged, dry or sulphated battery, defective battery connections, defective switch contacts, defective starter connections, dirty commutator, high mica, dirty or sticking brushes, defective connections between armature coils and commutator bars or open circuits are the chief causes of low speed and low current.

Oiling.—Starter bearings are of the oilless type and require no lubrication.

Generator.—Generator current regulation is by third brush method. Generator No. 131 is used on the Model 860 cars, and No. 138 on the Model 870 cars.

GENERATOR DATA

Generator No. 131		Generator No. 138	
Amperes	R. P. M.	Amperes	R. P. M.
Neutral	500	Neutral	500
10-12	900	10-12	900
16-18	1400	14-16	1400
14-16	2000	11-13	2000

To adjust charging rate, loosen the two screws which hold third brush arm. Move to the right to increase charging rate and to the left to decrease. Maximum output should not exceed 18 amperes at 20-25 miles per hour.

Oiling.—Put 6 or 8 drops of light machine oil in the oil hole at forward end of generator and in oil hole at commutator end every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Relay.—There is no relay. The circuit between the generator and battery is controlled by the ignition switch.

Lamps.—Head lamps are 6-8 volt, 17 cp. Dash and tail lamps are in series, and are each 3-4 volt, 2 cp.

Circuit Breaker.—There is a vibrating circuit breaker in the lighting circuit to take the place of fuses. It requires a current of 25 amperes to start this device vibrating, but a current of 3 to 5 amperes will cause it to continue.

Model Numbers.—Both models use starter No. 72 and ignition coil No. 2162. Model 860 uses generator No. 131, distributor No. 5159, combination switch No. 1087 and starter switch No. 1963. Model 870 uses generator No. 138, distributor No. 5192, combination switch No. 1107 and starter switch No. 1966.

SAYERS

(1919) 7-W CONTINENTAL ENGINE

DELCO GENERATING, STARTING AND LIGHTING SYSTEM

DELCO IGNITION

BATTERY.—Willard, 6 volt, 80 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 2158. Breaker contacts separate .018 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING.—Put 4 or 5 drops of light engine oil in the distributor unit oilers every two weeks. If the track of the rotor button in the distributor head is not well polished, apply a small amount of vaseline with a soft cloth. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when the piston entering the power stroke is on top dead center, spark control lever and breaker assembly one-third advanced.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .030 inch.

STARTER.—Model No. 106. Starter is connected to the engine through a Bendix drive. Lock torque is 16 pound-feet. Running freely, starter takes 40 amperes.

OILING.—Starter bearings are of the oilless type.

GENERATOR.—Model No. 105. Generator current regulation is by the third brush system. Generator begins to supply current at 500 R.P.M. of the armature or 7-8 miles per hour, and reaches the maximum current output of 16 amperes at 18-25 miles per hour.

Cold Test		Generator Data		Hot Test	
Amperes	R.P.M.	Amperes	R.P.M.	Amperes	R.P.M.
Neutral	500	Neutral	500		
10.5-12.5	900	10-12	900		
15.5-18.0	1400	14-16	1400		
13.0-17.0	2000	11-13	2000		

OILING.—Put 4 or 5 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—There is no relay. The circuit between the generator and battery is controlled by the ignition switch.

To vary the charging rate loosen the two screws which hold the third brush arm. Reseat the brush after adjusting the position.

Move the third brush to the right (facing the commutator end) to increase the charging rate, and to the left to decrease the charging rate. Tighten the two screws and

LAMPS.—The head lamps are 6-8 volt, 17 cp. Dash and tail lamps are 6-8 volt, 2 cp.

CIRCUIT BREAKER.—A vibrating circuit breaker takes the place of fuses. It requires 25 amperes to start the vibrator, but 3-5 amperes will cause it to continue.

Plate No. 305

BRISCOE

Model B-4-24 (1917-18-19)

Auto-Lite Starting and Lighting System Connecticut Ignition

Battery.—Battery is 6 volt, 80 ampere-hour. The positive (+) terminal is grounded.

Ignition.—Breaker contacts should separate .023 inch. They are made of tungsten. They will operate properly even though quite rough. Should they become badly worn, affecting the ignition, the inner breaker mechanism should be renewed. To do this, remove the wire which leads to breaker from coil terminal marked C. Unclasp and remove distributor head, leaving wires on. Lift off distributor rotor. Unscrew the two retaining screws which hold the breaker in the case. Then remove the breaker by pulling upward. Remove the primary wire and keep it, to be replaced on the new breaker. To install new breaker, reverse the operations described above. Do not file breaker contacts. In an emergency, they may be resurfaced enough to give service for 300 or 400 miles by drawing a piece of fine emery cloth between them.

Timing.—Contacts should separate when piston entering power stroke is on top dead center, or when flywheel marking "1:4" is at indicator, with spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plug Gaps.—Spark plug gaps should be .027 inch to .030 inch.

Oiling.—Refill the cup under the distributor head with pure vaseline and turn down every month. If car is driven more than 1000 miles in a month, this must be done every 1000 miles. Do not put grease or oil in the cup.

Starter.—Starter is connected to the engine through a Bendix drive. Cold engine, heavy oil, tight bearings or other obstructions, or damp, grounded or short circuited windings will cause high current and low speed during the cranking operation. Discharged, dry or sulphated battery, defective battery connections, defective switch contacts, defective starter connections, dirty commutator, high mica, dirty or sticking brushes, defective connections between armature coils and commutator bars or open circuits are the chief causes of low speed and low current.

Oiling.—Starter bearings are packed with medium cup grease. They should be thoroughly cleaned out and grease renewed every six months.

Generator.—Generator is Type GH. Current regulation is by third brush method.

GENERATOR DATA, TYPE GH

Amperes	R. P. M.
5.0	760- 820
10.0	1020-1100
12.5	1200-1300
15.0	1460-1675
15.4-16.8	1950-2250

Shunt field should draw 1.7 amperes. Running freely as a motor, generator should draw 2.7 amperes and turn at 450 R. P. M. Much higher speed indicates damp, grounded or short circuited field coils. Greater current or lower speed indicates tight bearings or damp, grounded or short circuited armature windings or commutator.

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Relay.—Relay should close at 550-600 R. P. M., of generator armature. Charging current should be .5-1.5 amperes at closing, and discharge current 0-1 ampere at opening of relay contacts. Clean relay contacts by drawing a piece of unglazed paper between them. If badly burned or pitted, resurface with a strip of well worn No. 00 sand paper, and then draw a piece of unglazed paper between them to remove all grit. Adjust before again putting into service.

Lamps.—Head lamps are 6-8 volt, 20 cp. Tail lamp is 6-8 volt, 2 cp. Dash lamp is 6-8 volt, 2 cp.

Essex

Model A (1918-19) (Serial Nos. for 1918, A-5000 to A-39999)

Delco Generating, Starting and Lighting System
Delco Ignition

Plate No. 306

Battery.—The battery is 6 volt, 100 ampere-hour. The negative (—) terminal is grounded

Ignition.—Breaker contacts should separate .018 inch. They are made of tungsten. They will operate properly even though very irregular, due to the fact that the rough surfaces fit each other perfectly. Their natural color is dark gray, not silver. Should they become badly burned or pitted, affecting the ignition, remove and resurface them by drawing across a piece of fine emery cloth laid on a flat surface, as on the bed of a drill press, finishing on a very hard oil stone. Clean all oil from contacts before again putting into service. Spark control is both manual and automatic.

Timing.—Breaker cam should be so set that when the marking "A-1" appears at the pointer on the flywheel housing, the contacts will just open when the slack in the distributor driving gears is rocked forward, and will again close when the unit is rocked backward, with the spark control lever and breaker assembly in the fully advanced position.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plug Gaps.—The spark plug gaps should be .030 inch.

Oiling.—The distributor rotor button and the track which it follows, if not well polished, should be lubricated with a very small amount of vaseline. Apply 2 or 3 drops of light engine oil to the upper ball bearing of the distributor shaft every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles. Repack the distributor housing with soft cup grease every six months.

Starter.—The starting motor engages the flywheel through a Bendix drive. The motor circuit is completed by means of a switch located in the toe board. Cold engine, heavy oil, tight bearings or other obstructions, or damp, grounded or short circuited windings will cause high current and low speed during the cranking operation. Discharged, dry or sulphated battery, defective battery connections, defective switch contacts, defective starter connections, dirty commutator, high mica, dirty or sticking brushes, defective connections between armature coils and commutator bars or open circuits are the chief causes of low speed and low current.

Oiling.—Every two weeks put 4 or 5 drops of light engine oil in the oiler at the commutator end bearing. At the same time put 8 or 10 drops in the oiler on the rear end of the motor which supplies lubrication to the armature and starting gear bearings.

Generator.—Generator current regulation is by third brush method. Normal maximum output is 14-16 amperes at 20-25 miles per hour. Charging rate is adjustable by loosening the three screws which hold the bearing retainer plate in place on the commutator end. To increase charging rate, move the third brush in a counter-clockwise direction (when facing the commutator end), and in a clockwise direction to reduce the charging rate. The brush must be reseated after adjusting position.

Oiling.—Every two weeks put 4 or 5 drops of light engine oil in each of the generator oilers. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Relay.—There is no relay. The circuit between the generator and battery is controlled by the ignition switch.

Lamps.—Head lamps are 6-8 volt, 22 cp. Dash and tail lamps are in series and are each 3-4 volt, 2 cp.

Circuit Breaker.—There is a vibrating circuit breaker to take the place of fuses in the lighting circuit. It should take about 25 amperes to start the device vibrating, but a current of 3 to 5 amperes will cause it to continue vibrating.

Model Numbers.—Starter is No. 130 or No. 161. Generator is No. 133 or No. 166. Combination switch is No. 1130. Ignition coil is No. 2127. Distributor is No. 5193

Plate No. 307

They will operate properly even though very irregular, due to the fact that the rough surfaces fit each other perfectly. Their natural color is dark gray, not silver. Should they become badly burned or pitted, affecting the ignition, remove and resurface them by drawing across a piece of fine emery cloth laid on a flat surface, as on the bed of a drill press, finishing on a very hard oil stone. Clean all oil from contacts before again putting into service.

Timing.—Contacts should begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—Spark plug gaps should be .027 inch to .030 inch.

Oiling.—Put 5 or 6 drops of light engine oil in the top distributor bearing every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Starter.—Starter is connected to the engine through a Bendix drive. The lock torque is 16 pound-feet. When running freely starter takes 40 amperes. Cold engine, heavy oil, tight bearings or other obstructions, or damp, grounded or short circuited windings will cause high current and low speed during the cranking operation. Discharged, dry or sulphated battery, defective battery connections, defective switch contacts, defective starter connections, dirty commutator, high mica, dirty or sticking brushes, defective connections between armature coils or commutator bars or open circuits are the chief causes of low speed and low current.

Oiling.—Put several drops of light engine oil in the starter oilers every month. Models No. 106 and 136 require no oil as they have oilless bearings.

Generator Models No. 101, 105 and 135.

Generator.—Generator current regulation is by third brush system.

GENERATOR DATA, MODEL 101

Hot Test		Cold Test	
Amperes	R. P. M.	Amperes	R. P. M.
Neutral	500	Neutral	500
10-12	900	10.5-12.5	900
14-16	1400	15.5-18.0	1400
11-13	2000	13.0-17.0	2000

Generator should begin to supply current at 8-10 miles per hour and reach its maximum output of 16-18 amperes at 20-25 miles per hour.

Oiling.—Put several drops of light engine oil in each of the generator oilers every two weeks. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.

Relay.—There is no relay. The circuit between the generator and battery is controlled by the ignition switch.

Lamps.—Head lamps are 6-8 volt, 17 cp. Dimmer lamps are 6-8 volt, 4-6 cp. Dash lamp is 6-8 volt, 2 cp. Tail lamp is 6-8 volt, 2 cp.

Circuit Breaker.—There is a vibrating type circuit breaker on the back of lighting switch, to take the place of fuse in the lighting circuit. It should take about 25 amperes to start this device vibrating, but once set vibrating, 3 to 5 amperes will cause it to continue.

Model Numbers.—Generator is No. 101. Starter is No. 102.

Note:—On some models in 1918 the generator shunt field was connected to the switch terminal of the ignition coil.

Cadillac

Model 53 (1916) (Serial Nos. A20,000 to A38,003)

Delco Starting and Lighting System

Delco Ignition

Cadillac, Mode. 53 (1916), Delco System

Plate No. 308

SERVICE ENGINEERING COMPANY, SAN FRANCISCO—COPYRIGHTED, 1926

Battery.—Battery is 6 volt, 150 ampere-hour. The positive (+) terminal is grounded.

Ignition.—Breaker contacts should separate .018 inch. They are made of tungsten. They will operate properly even though very irregular, due to the fact that the rough surface fit each other perfectly. Should they become badly burned or pitted, affecting the ignition, remove and resurface them by drawing across a piece of fine emery cloth laid on a flat surface, as on the bed of a drill press, finishing on a very hard oil stone. Clean all oil from contacts before again putting into service.

Timing.—Breaker contacts should separate when flywheel marking "1-GA" is directly under indicator, No. 1 piston of left-hand block entering power stroke, spark control lever and breaker assembly in fully retarded position.

Firing Order.—The firing order is 1L, 2R, 3L, 1R, 4L, 3R, 2L, 4R.

Spark Plug Gaps.—Spark plug gaps should be .028 inch to .030 inch.

Oiling.—Every 2000 miles remove the breather pipe on the ignition unit and pack the gears with soft cup grease. If track of rotor button inside distributor head is not well polished, apply a very small amount of vaseline with a soft cloth.

Starter-Generator.—Starter and generator are combined into one unit, but are electrically separate. Starter is connected to the flywheel through a pinion shifted by the operator. Cold engine, heavy oil, tight bearings or other obstructions, or damp, grounded or short circuited windings will cause high current and low speed during the cranking operation. Discharged, dry or sulphated battery, defective battery connections, defective starter connections, dirty commutator, high mica, dirty or sticking brushes, defective connections between armature coils and commutator bars or open circuits are the chief causes of low speed and low current.

Generator.—Generator current regulation is by third brush method.

GENERATOR DATA, MOTOR-GENERATOR No. 78

Output-Amperes	R. P. M.
Neutral.....	375
3- 8.....	500
16-20.....	1000
12-17.....	1500
11-16.....	1800

When motoring with the overrunning clutch as the only retarding force, generator should take 4.5 amperes. To adjust the charging rate, loosen the two screws on the movable arm holding the third brush. If it is desired to increase the charging rate, the arm should be lengthened, and shortened to decrease it.

Oiling.—Put 4 or 5 drops of light engine oil in starter-generator oiler every two weeks. At the same time inject Cadillac rear axle and transmission lubricant in elbow oiler at rear of starter shaft with grease gun. If car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

Relay.—There is no relay. Circuit between generator and battery is controlled by ignition switch.

Lamps.—Head lamps are 6-8 volt, 20 cp. Side lamps are 6-8 volt, 6 cp. Tail and dash lamps are in series and are each 3-4 volt, 2 cp. Tonneau lamp is 6-8 volt, 2 cp.

Circuit Breakers.—There is a vibrating circuit breaker in the circuit to the head, side, dash and tail lamps, which takes the place of fuses. It requires a current of 25 amperes to start this device vibrating, but when vibrating a current of 3 to 5 amperes will cause it to continue. There is a lock-out circuit breaker in the circuit to the horn, tonneau lamp and handy lamp socket. A current of 25 amperes will cause this device to open the circuit.

Model Numbers.—Motor-generator is No. 78. Ignition coil is No. 2115. Combination switch is No. 1062 or No. 1069.

Plate No. 309

Haynes

Model 45 Six Cylinder (1919)

Leece-Neville Generating, Starting and Lighting System Kingston Ignition

Battery.—Battery is 6 volt, 100 ampere-hour. The two wire system is used.

Ignition.—Breaker contacts should separate .018 inch to .020 inch. Should they become badly burned or pitted, affecting the ignition, resurface with a very fine, flat jeweler's file or a worn strip of No. 00 sand paper. Ignition coil should take about 4 amperes, engine idle.

Timing.—Contacts should begin to separate when the top dead center mark on the fly-wheel is 1 inch past the indicator, spark control lever and breaker assembly in the fully retarded position. (There is a removable plate covering an opening on top of flywheel housing, through which flywheel may be viewed.)

Firing Order.—The firing order is 1, 4, 2, 6, 3, 5.

Spark Plug Gaps.—The spark plug gaps should be .018 inch to .020 inch.

Oiling.—Refill grease cup under breaker head with soft cup grease and turn down once a month. Should car be driven more than 1000 miles in a month, this must be done every 1000 miles.

Starter.—Starter is connected to the engine through a Bendix drive. It should crank the engine at 125 to 150 R. P. M. The current during full cranking speed should be 200-225 amperes, although the current may reach as high as 550 amperes when first starting to turn the engine over. Cold engine, heavy oil, tight bearings or other obstructions, or damp, grounded or short circuited windings will cause high current and low speed during the cranking operation. Discharged, dry or sulphated battery, defective battery connections, defective switch contacts, defective starter connections, dirty commutator, high mica, dirty or sticking brushes, defective connections between armature coils and commutator bars or open circuits are the chief causes of low speed and low current. Starter rotates counter-clockwise, as viewed from the driving end.

Oiling.—Put several drops of light engine oil in starter oilers every month.

Generator.—Generator current regulation is by third brush. Generator output should be 15 amperes at 1200 R. P. M., of armature, or 20 miles per hour. Output is changed by turning the adjusting nut on front end cover of generator. Turning the nut to the left increases the output. Turning the nut to the right decreases the output. Before turning the adjustment nut, loosen the lock screw just below and to the left of the nut, and tighten screw again after adjustment is made. Generator rotates clockwise as viewed from driving end.

Oiling.—Put 5 or 6 drops of light engine oil in each of generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Trouble Shooting.—To test for a short in the shunt field circuit, remove the third brush from its holder and connect it to the negative (—) terminal of a 6 volt storage battery. Then connect the positive (+) terminal of the battery to the positive (+) terminal of an ammeter and connect the negative (—) terminal of the ammeter to the screw at the end of the fuse clip. Four amperes should flow. If a larger current flows, there is a short in the field circuit. The generator will not operate when the fuse is burned out or removed.

Relay.—Relay should close at 6-8 and open at 5-7 miles per hour. Charging current should be 1 to 3 amperes at closing, and the discharge current 0 to 1 ampere at opening of relay. Relay contacts should separate .030 inch. Clean relay contacts by drawing a piece of unglazed paper between them. If badly burned or pitted, resurface with a strip of well worn No. 00 sandpaper, and then draw a piece of unglazed paper between them to remove all grit. Adjust before again putting into service.

Lamps.—Head lamps are 6-8 volt, 21 cp. Dash lamp is 6-8 volt, 2 cp. Tail lamp is 6-8 volt, 2 cp.

Fuse.—There is a 5 ampere fuse on the relay base to protect the generator fields. It will burn out if the generator is run with high resistance in charging circuit, or if a short circuit occurs in the shunt coils.

Plate No. 310

OLDSMOBILE

MODEL 45-A (1918-19) (SERIAL NOS. 145000 UP) DELCO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

BATTERY.—Battery is 6 volt, 84 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Breaker contacts separate .020 inch. They are made of tungsten. When the condition of the points affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING.—Put 4 or 5 drops of light engine oil in the oiler on the side of the distributor housing every two weeks. If the track of the distributor rotor button is not well polished apply a small amount of vaseline with a soft cloth. If car is driven more than 500 miles in two weeks these attentions must be given every 500 miles.

TIMING.—Breaker contacts separate when piston entering power stroke is on top dead center, spark control lever 2 inches from the top on the 1919 cars, and in the fully retarded position on the 1918 cars.

FIRING ORDER.—The firing order is 1 R, 4 L, 3 R, 2 L, 4 R, 1 L, 2 R, 3 L.

SPARK PLUG GAPS.—Spark plug gaps are .030 inch.

STARTER.—Starter is connected to the engine by a Bendix drive. Operating without load, starter takes 40 amperes. The lock torque is 17.5 pound-feet with a voltage of 3.5 to 3.8 volts.

OILING.—Starter bearings are of the oilless type.

GENERATOR.—Generator current regulation in by third brush system.

Generator Data.—Nos. 134 and 137

Cold.—Amperes	R.P.M.	Warm.—Amperes	R.P.M.
Neutral.....	500	Neutral.....	500
10.5-12.5.....	900	10-12.....	900
15.5-18.0.....	1400	14-16.....	1400
13.0-17.0.....	2000	11-16.....	2000

Generator begins to supply current at 7-8 miles per hour and reaches its maximum output of 16-18 amperes at 20-25 miles per hour. Charging rate is changed by adjusting the position of the third brush. Move third brush in a clockwise direction (looking at commutator end), to decrease charging rate, and in a counter-clockwise direction to increase the charging rate.

OILING.—Put 5 or 6 drops of light engine oil in each of generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—There is no relay. The circuit between the generator and battery is controlled by the ignition switch.

LAMPS.—Head lamps are 6-8 volt, 17 cp. Dimmer lamps are 6-8 volt, 5 cp. Dash and tail lamps are each 6-8 volt, 2 cp. Tonneau lamp is 6-8 volt, 2 cp.

CIRCUIT BREAKER.—There is a vibrating circuit breaker on the back of the lighting switch which takes the place of fuses in the lighting circuits. It requires a current of 25 amperes to start this device vibrating, but when vibrating, 3 to 5 amperes will cause it to continue.

MODEL NUMBERS.—Generator Nos. 134 and 137 are used. Starter is No. 72. Ignition coil is No. 2162. Combination switch is No. 1104.

Plate No. 311

Columbia

Models C and D (1917-18-19)

Robbins-Meyers Generating, Starting and Lighting System

Atwater Kent Ignition

Battery.—Battery is 6 volt, 80 ampere-hour. The positive (+) terminal is grounded.

Ignition.—Contacts should separate .005 inch to .008 inch. They are made of tungsten and will operate properly even though quite rough. Their natural color is dark gray, not silver. If badly burned or corroded, affecting the ignition, remove and clean by drawing across a piece of very fine emery cloth laid on a flat surface, as on the bed of a drill press, finishing on a very hard oil stone.

Timing.—Contacts should begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly is the fully retarded position.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—Spark plug gaps should be .023 inch.

Oiling.—Put several drops of light engine oil in the oil hole, exposed when distributor cap is removed, every two weeks. At the same time put a very small amount of vaseline on the cam, applying with a toothpick. If car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

Starter.—Starter is connected to the engine through a Bendix drive. It should crank the normal engine at 85 R. P. M., taking 450 amperes. Cold engine, heavy oil, tight bearings or other obstructions, or damp, grounded or short circuited windings will cause high current and low speed during the cranking operation. Discharged, dry or sulphated battery, defective battery connections, defective switch contacts, defective starter connections, dirty commutator, high mica, dirty or sticking brushes, defective connections between armature coils and commutator bars or open circuits are the chief causes of low speed and low current. When operating freely, starter takes 40 amperes, armature revolving at 3500 R. P. M. Pressure of brushes on commutator should be 8 ounces.

Oiling.—Starter bearings are packed with soft cup grease. Clean out and repack every six months.

Generator.—Generator current regulation is by a Ward-Leonard vibrating regulator. Generator current should be 10 amperes, at 950 R. P. M. When operating freely as a motor, generator should take 30 amperes at 6 volts, armature revolving at 150 R. P. M. Much higher speed indicates damp, grounded or short circuited field coils. Greater current or lower speed indicates tight bearings or damp, grounded or short circuited armature windings or commutator. Shunt field should take 3 amperes. Pressure of generator brushes on commutator should be 9 ounces.

Oiling.—Thoroughly clean out and repack generator bearings with soft cup grease every six months.

Relay-Regulator.—Relay and regulator are combined into one unit. Relay should close at 450 R. P. M., or 8-10 miles per hour. Relay should open at 425 R. P. M., or 6-8 miles per hour. Charging current should be 1 to 3 amperes at closing and the discharge current 0 to 1 ampere at opening of relay contacts. Clean relay and regulator contacts by drawing a piece of unglazed paper between them. If badly burned or pitted, resurface with a strip of well worn No. 00 sand paper, and then draw a piece of unglazed paper between them to remove all grit. Adjust before again putting into service. Relay and regulator contacts should separate .014 inch to .017 inch.

Lamps.—Head lamps are 6-8 volt, 15 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash lamp is 6-8 volt, 2 cp. Tail lamp is 6-8 volt, 2 cp.

Mitchell

Models E-40 and E-42 (1919)

Remy Generating, Starting and Lighting System

Remy Ignition

Battery.—Battery is 6 volt, 80 ampere-hour. The positive (+) terminal is grounded.
Ignition.—Breaker contacts should separate .020 inch to .025 inch. If burned or pitted, affecting the ignition, resurface them with a very fine, flat jeweler's file or a strip of worn No. 00 sandpaper.

Timing.—Contacts should begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—Spark plug gaps should be .022 inch.

Oiling.—Refill the cup under the distributor head with soft cup grease and turn down two turns every two weeks. At the same time put a small amount of vaseline on the fiber bumper of the contact arm, using a toothpick. If the car is driven more than 500 miles in two weeks, these attentions should be given every 500 miles.

Starter.—Starter is connected to engine through a Bendix drive.

STARTER DATA. MODEL 304-A

Torque	R. P. M.	Amperes	Volts
1 lb. ft.	2000	90-100	5.4-5.6
2 lb. ft.	1500	140-145	5.1-5.3
4 lb. ft.	1000	220-225	4.7-4.9
5 lb. ft.	850	225-260	4.5-4.7
6 lb. ft.	600	290-300	4.2-4.5
15 lb. ft.	Lock	550-575	3.3-3.4

Cold engine, heavy oil, tight bearings or other obstructions, or damp, grounded or short circuited windings will cause high current and low speed during the cranking operation. Discharged, dry or sulphated battery, defective battery connections, defective switch contacts, defective starter connections, dirty commutator, high mica, dirty or sticking brushes, defective connections between armature coils and commutator bars or open circuits are the chief causes of low speed and low current.

Oiling.—Put several drops of light engine oil in each of starter bearings every month.

Generator.—Generator current regulation is by third brush system. A thermostat located in the brush rigging, of the generator cuts in a resistance at a temperature of 175° F., reducing the maximum charging rate 6 amperes. Resistance also acts as a shunt field fuse. The thermostat is intended to change the charging rate as demand of seasons or car operation requires. Never touch the thermostat points.

GENERATOR DATA, MODEL No. 232-A

Amperes	R. P. M.	Volts
0	515	6.4
7	745	7.1
14	1000	7.9
22	1800	8.6
17	2500	8.2
10	3500	7.4

Above tests to be made without ignition, relay in circuit and thermostat contacts closed. Pressure of main brushes on commutator should be 17 to 20 ounces. Pressure of third brush on commutator should be 13-17 ounces. Shunt field should take 5 amperes at 6.4 volts.

Oiling.—Put several drops of light engine oil in each of generator oilers every two weeks. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.

Relay.—Relay should close at 8-10 miles per hour, or 500-550 R. P. M., of armature. Charging current should be 1 to 3 amperes at closing, and the discharge current 0 to 1 ampere at opening of relay contacts. Contacts should separate .012 inch to .015 inch. Air gap between relay armature (moving member) and coil core should be .012 to .015 inch. Clean relay contacts by drawing a piece of unglazed paper between them. If badly burned or pitted, resurface with a strip of well worn No. 00 sandpaper, and then draw a piece of unglazed paper between them to remove all grit. Adjust before again putting into service.

Lamps.—Head lamps are 6-8 volt, 15 cp. Dash lamp is 6-8 volt, 2 cp. Tonneau lamp is 6-8 volt, 2 cp. Tail lamp is 6-8 volt, 2 cp.

Fuses.—Fuses are 20 ampere.

Plate N . 312

Plate No. 313

LEXINGTON

Model R (1918) And R-19 (1919)

Westinghouse Generating, Starting and Lighting System Connecticut Ignition

Battery.—Battery is 6 volt, 100 ampere-hour. The positive (+) terminal is grounded.

Ignition.—Breaker contacts separate .023 inch. They are made of tungsten. When the condition of the points affects the ignition, renew the inner breaker mechanism. For temporary service, resurface contacts with fine emery cloth.

Oiling.—Refill the cup under the breaker head with pure vaseline and turn down every month. If car is driven more than 1000 miles in a month, this must be done every 1000 miles. Do not put grease or oil in the cup.

Timing.—Contacts begin to separate when piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—Spark plug gaps are .023 inch.

Starter.—Frame No. 710. Starter is connected to engine through a Bendix drive. Torque is 2.5 pound-feet at 1200 R. P. M. Lock torque is 14 pound-feet, current 450 amperes.

Oiling.—Refill starter oil wells with light engine oil every month.

Generator.—Frame No. 760. Generator current regulation is by third brush system. Current output is varied by adjustment of third brush setting. Normally set the third brush so that at 1100-1500 R. P. M., the maximum current output is 15 to 17 amperes, at 7½ volts. The cold test readings are obtained with the normal setting of third brush, and a generator temperature under 35° C., or 95° F. The hot test readings are obtained after the generator has been operated one hour at 1800 R. P. M., charging a half-charged battery or its equivalent.

GENERATOR DATA

Cold Test

R. P. M.	Generator Output—Amperes	Generator Voltage
500.....	0	6.5
750.....	8	6.5
1250.....	15-17	7.5
2500.....	7-11	6.5-7.5

Hot Test

R. P. M.	Generator Output—Amperes	Generator Voltage
1250.....	12-14	7.5
2500.....	7-11	6.5-7.5

Field current is 2.8 to 3.25 amperes, 6 volts. Field resistance is 1.9 to 2.25 ohms at 25° C., or 77° F.

Field Test, Generator Operating—Cold Test

R. P. M.	Generator Output Amperes	Generator Voltage	Field Current
1250.....	15-17	7.5	1.5-2.4

Hot Test

R. P. M.	Generator Output Amperes	Generator Voltage	Field Current
1250.....	12-14	7.5	1.5-2.2

Operating freely as a motor, current flow is 3.5 to 5 amperes, 6 to 6.6 volts.

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Relay.—Relay closes at 8-10 miles per hour or 500-550 R. P. M., of armature, and opens at 6-8 miles per hour, or 450-500 R. P. M., of armature. Charging current is 1 to 2 amperes at closing, and the discharge current 0 to 2 amperes at opening of relay. Air gap between relay armature (moving member) and coil core is .031 inch, contacts separated. Contacts separate .013 to .018 inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No 00 sand paper. Remove all grit. Adjust before again putting into service.

Lamps.—Head lamps are 6-8 volt, 21 cp. Dimmer lamps are 6-8 volt, 7 cp. Dash and tail lamps are 6-8 volt, 2 cp. On the 1918 cars, head lamps are 6-8 volt, 32 cp.

Fuses.—Fuses are 15 amperes.

MADISON

Models 6-40 And 8-18 (1916-17-18-19)

Remy Starting and Lighting System

Remy Ignition

Battery.—Battery is 6 volt, 100 ampere-hour. The positive (+) terminal is grounded.

Ignition.—Breaker contacts should open .020 inch to .023 inch.

Care.—Resurface them with a fine, flat jeweler's file or a strip of worn No. 00 sand paper.

Timing.—Contacts should begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order of the "Six" is 1, 5, 3, 6, 2, 4. That of the "Eight" is 1R, 1L, 3R, 3L, 4R, 4L, 2R, 2L.

Spark Plug Gaps.—The spark plug gap should be .028 inch to .031 inch.

Oiling.—Every month put a very small amount of vaseline on the fiber bumper of the contact arm. If there is a grease cup provided, keep it filled with soft cup grease and tighten two turns every month.

Starter.—Starter is connected to the engine through a Bendix drive. The following data applies to the Model 180-C starter, used on the eight cylinder cars:

Torque (with 6 pulley)	R. P. M.	Amperes	Volts
0 lbs.	3600-4000	55- 65	6.0
16 lbs.	1200-1450	200-220	4.6
24 lbs.	900-1100	290-310	4.5
40 lbs.	300- 450	460-600	3.6
14 ft. lbs.	Lock torque	550-600	3.2

The following data applies to the Model 186-A starter, used on the six cylinder cars:

Torque with 6" pulley	R.P.M.	Amperes	Volts
0 lbs.	3600-4200	56- 64	6.0
16 lbs.	1200-1450	200-230	4.7-4.8
24 lbs.	900-1100	290-310	4.5-4.6
40 lbs.	300- 450	450-500	3.5-3.6
14 lbs.	Lock torque	570-600	3.0

Oiling.—Put several drops of light engine oil in each of the motor oilers every month.

Generator.—Generator current regulation is by vibrating regulator. Relay closes at about 8 miles per hour, and opens at about 6 miles per hour. The relay and regulator contacts should separate .012 inch to .015 inch.

Care.—Clean by drawing a piece of soft paper between them. If necessary, resurface them with a piece of well worn No. 00 sand paper. The air gap between the relay armature and the magnet core should be .012 inch to .015 inch when relay contacts are closed. The following data applies to the Model 16-C generator, used on the eight cylinder cars:

Amperes	R. P. M.	Volts
0	370	6.0
7	490	6.5
14.2	2200	6.9

5.9 volts will force 3 to 3.5 amperes through field windings. 5.8 volts will force 5.5 amperes through generator rotating it, running free at 430 R. P. M.

The following data applies to Model 168-A generator, used on the six cylinder cars, all tests to be made without ignition:

Amperes	R. P. M.	Volts
0	600- 650	6.0
7	780- 850	6.4
14.5	2500-3000	7.2

5.7 volts will force 5.5 amperes through generator rotating it running free at 420 R. P. M. Shunt field is protected by 15 ampere fuse. 5.9 volts will force 4 amperes through field windings.

Oiling.—Every two weeks put 5 or 6 drops of light engine oil in each of the generator oilers. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Lamps.—Head lamps are 6-8 volts, 17 cp. Dimmer lamps are 6-8 volts, 5-7 cp. Dash lamp is 6-8 volts, 2-4 cp. Tail lamp is 6-8 volts, 2 cp. Trouble lamp is 6-8 volts, 2 cp.

Fuses.—All fuses in the lighting circuits and the horn circuit are 4 ampere.

MADISON
MODEL 6-40 (1918-19)
REMY SYSTEM

Plate No. 314

Plate No. 315

ALLEN Series 41 (1918-19) **AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM** Connecticut Ignition

Battery.—Battery is 6 volt, 85 ampere-hour. The negative (—) terminal is grounded.

Ignition.—Breaker contacts should separate .018 inch to .020 inch. They are made of tungsten. They will operate properly even though quite rough. Should they become badly worn, affecting the ignition, the inner breaker mechanism should be renewed as directed on Page 50. In an emergency, contacts may be resurfaced enough to give service for 300 or 400 miles by drawing a piece of fine emery cloth between them.

Timing.—Breaker contacts should begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 2, 4, 3.

Spark Plug Gaps.—Spark plug gaps should be .027 inch to .030 inch.

Oiling.—Refill the cup under the breaker head with pure vaseline and turn down every month. If car is driven more than a 1000 miles in a month, this must be done every 1000 miles. Do not put grease or oil in the cup.

Starter.—Starter is connected to engine through a Bendix drive. When running free, armature should turn at about 4200 R. P. M., taking 50-55 amperes. Much greater speed indicates grounded, short circuited or damp field windings. Greater current or vibrating of the ammeter needle indicates grounded or short circuited armature coils or commutator. Damp armature windings will cause high current or slow speed.

STARTER DATA, MODEL MC

Torque	R. P. M.	Amperes
1 lb. ft.	2650	100
2 lb. ft.	1900	145-150
3 lb. ft.	1600	185-190
4 lb. ft.	1400	225
5 lb. ft.	1250	250-255
6 lb. ft.	1000	290-300

Starter develops 16 pound-feet lock torque, taking 450-460 amperes at 3.8 to 4.2 volts.

Oiling.—Clean and repack starter bearings with soft cup grease every six months. Put in one or two drops of oil every month to keep grease soft.

Generator.—Generator current regulation is by either third brush or reverse series field. Relay should close at 8 to 10 and open at 6 to 8 miles per hour. Should it ever be necessary to operate the generator with the battery disconnected, the terminals must be short circuited to prevent the burning out of the windings or lamps.

GENERATOR DATA

Model GH (Third Brush Regulation)		Reverse Series Field Regulation	
Amperes	R. P. M.	Amperes	R. P. M.
5	760-820	5	495-575
10	1020-1100	10	850-1035
12.5	1200-1300	12.5	1120-1770
15	1460-1675	15	1475-1810
15-16	1950-2250	17-19	2400-2800

Although generator output may be varied by adjustment of the third brush, the above rates will give satisfaction under average conditions. If operated freely as a motor, armature should revolve at 450 R. P. M., taking 2.7 amperes on the GH type and at 200 R. P. M., taking 1.8 amperes on the GA type. On GA generators, a variation of 1.5 amperes from these rates given is allowable. Output may be varied by adjusting brush pressure. Pressure should be 1 to 1½ pounds. Much higher speed indicates damp, grounded or short circuited field coils. Greater current or lower speed indicates tight bearings or damp, grounded or short circuited armature windings or commutator. Periodic swinging of ammeter needle indicates grounded or short circuited armature coils or commutator bars. Bearings must be in proper condition when testing generator. Shunt field should take 1 ampere on the type GA generators and 1.7 amperes on the type GH generators.

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Lamps.—Head lamps are 6-8 volts, 15 cp. Dimmer lamps are 6-8 volts, 4 cp. Dash and tail

CADILLAC **Model 55 (1917-18) 57 (1918, 1919)** **DELCO GENERATING, STARTING AND LIGHTING SYSTEM** **DELCO IGNITION**

CADILLAC
MODEL 57 (1919)
DELCO SYSTEM

Plate No. 316

Battery.—Battery is 6 volt, 150 ampere-hour. The positive (+) terminal is grounded.

Ignition.—Breaker contacts should separate .018 inch. They are made of tungsten. They will operate even though very irregular, due to the fact that the rough surfaces fit each other perfectly. Their natural color is dark gray, not silver. Should they become badly burned or pitted, affecting the ignition, remove and resurface them by drawing across a piece of fine emery cloth laid on a flat surface, as on the bed of a drill press, finishing on a very hard oil stone. Clean all oil from contacts before again putting into service.

Timing.—Breaker contacts should separate when flywheel marking "1-GA" is directly under indicator, No. 1 piston of left-hand block entering power stroke, spark control lever and breaker assembly in fully retarded position.

Firing Order.—The firing order is 1L, 2R, 3L, 1R, 4L, 3R, 2L, 4R.

Spark Plug Gaps.—Spark plug gaps should be .028 inch to .030 inch.

Oiling.—Every 2000 miles remove the breather pipe on the ignition unit and pack the gears with soft cup grease. If track of rotor button inside distributor head is not well polished, apply a very small amount of vaseline with a soft cloth.

Starter-Generator.—Starter and generator are combined into one unit, but are electrically separate. Starter is connected to the flywheel through a pinion shifted by the operator. Two overrunning clutches are provided. In connection with the ignition switch, a circuit is closed allowing a current flow through the generator windings causing the armature to revolve slowly, facilitating the meshing of the reduction gears. One clutch permits this rotation, and also permits a relatively high speed of the armature, necessary when operating as a starter. The second overrunning clutch prevents the engine from driving the armature through the reduction gears. Depressing the starting pedal meshes the reduction gears, opens the generator circuit, and allows the motor brushes to come in contact with the commutator, closing the starter circuit and cranking the engine. When the pedal is released, a spring reverses these operations. When running freely, starter turns at 4000-4500 R. P. M., drawing 50-70 amperes. Cold engine, heavy oil, tight bearings or other obstructions, or damp, grounded or short circuited windings will cause high current and low speed during the cranking operation. Discharged, dry or sulphated battery, defective battery connections, defective switch contacts, defective starter connections, dirty commutator, high mica, dirty or sticking brushes, defective connections between armature coils and commutator bars or open circuits are the chief causes of low speed and low current.

Generator.—Generator current regulation is by third brush system.

GENERATOR DATA. MOTOR-GENERATOR No. 98

Output-Amperes	R. P. M.
Neutral	500
10-12	1000
14-16	1500

When motoring with the overrunning clutch as the only retarding force, generator takes 4.5 amperes. To adjust the charging rate, loosen the two screws on the movable arm holding the third brush. If desirous of increasing the charging rate, the arm should be lengthened, and shortened to decrease it.

Oiling.—Put 4 or 5 drops of light engine oil in starter-generator oiler every two weeks. At the same time inject Cadillac rear axle and transmission lubricant in elbow oiler at rear of starter shaft with grease gun. If car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

Relay.—There is no relay. Circuit between generator and battery is controlled by ignition switch.

Lamps.—Head lamps are 6-8 volt, 20 cp. Side lamps are 6-8 volt, 6 cp. Tail and dash lamps are in series, and are each 3-4 volt, 2 cp. Tonneau lamp is 6-8 volt, 2 cp.

Circuit Breakers.—There is a vibrating breaker in the circuit to the head, side, dash and tail lamps, which takes the place of fuses. It requires a current of 25 amperes to start this device vibrating, but when vibrating a current of 3 to 5 amperes will cause it to continue. There is a lockout circuit breaker in the circuit to the horn, tonneau lamp and handy lamp socket. A current of 25 amperes will cause this device to open the circuit.

NASH
MODELS 681-687
DELCO SYSTEM

Plate No. 317

NASH
MODELS 681 TO 687 (1918-19)
DELCO GENERATING, STARTING AND LIGHTING SYSTEM
DELCO IGNITION

BATTERY.—Battery is 6 volt, 80 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 2163. Distributor Model No. 5169. Breaker contacts separate .018 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth, or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING.—Put 4 or 5 drops of light engine oil in the upper oiler of the distributor unit and fill the lower oil well every two weeks. If the track of the rotor button in the distributor head is not well polished, apply a small amount of vaseline with a soft cloth. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—The spark plug gaps are .030 inch.

STARTER.—Model No. 126. Starter is connected to the engine through a Bendix drive. Lock torque is 16 pound-feet, at 3.5 to 3.8 volts. Running freely, starter takes 40 amperes.

OILING.—Put 5 or 6 drops of light engine oil in each of the starter oilers every month.

GENERATOR.—Model No. 125. Generator current regulation is by third brush system. Generator begins to supply current at 500 R.P.M. of the armature or 6-8 miles per hour, and reaches its maximum current output of 18 amperes at 1400 R.P.M. of the armature or 20 miles per hour.

Cold Test		Generator Data		Hot Test	
Amperes	R.P.M.	Amperes	R.P.M.	Amperes	R.P.M.
Neutral	500	Neutral	500	Neutral	500
11.5-13.5	900	11-13	900	11-13	900
16.5-19.5	1400	16-18	1400	16-18	1400
15.0-18.0	2000	14-16	2000	14-16	2000

Charging rate is varied by adjusting the third brush setting. Loosen the two screws holding the third brush arm, and move the brush in a counter-clockwise direction to increase the charging rate. Move the third brush in a clockwise direction to decrease the charging rate. Tighten the holding screws and reseal the brush after adjusting position.

OILING.—Put 4 or 5 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—There is no relay. The circuit between the generator and the battery is controlled by the ignition switch.

LAMPS.—Head lamps are 6-8 volt, 18 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp.

CIRCUIT-BREAKER.—A vibrating circuit-breaker takes the place of fuses. It requires a current of 25 amperes to start the vibrator, but 3-5 amperes will cause it to continue.

LIBERTY MODELS 10, 10 A AND 10 B (1916-17-18-19)

Delco Generating, Starting and Lighting System Delco Ignition

Plate No. 318

Battery.—Battery is 6 volt, 93.8 ampere-hour. The negative (—) terminal is grounded.

Ignition.—Breaker contacts should separate .018 inch. They are made of tungsten. They will operate properly even though very irregular, due to the fact that the rough surfaces fit each other perfectly. Their natural color is dark gray, not silver. Should they become badly burned or pitted, affecting the ignition, remove and resurface them by drawing across a piece of fine emery cloth laid on a flat surface, as on the bed of a drill press, finishing on a very hard oil stone. Clean all oil from contacts before again putting into service.

Timing.—Breaker contacts should begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—Spark plug gaps should be .025 inch to .030 inch.

Oiling.—Put several drops of light engine oil in timer oiler every two weeks. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.

Starter.—Starter is connected to engine through a Bendix drive. It cranks the engine at 100 R. P. M., taking 145 amperes. Cold engine, heavy oil, tight bearings or other obstructions, or damp, grounded or short circuited windings will cause high current and low speed during the cranking operation. Discharged, dry or sulphated battery, defective battery connections, defective switch contacts, defective starter connections, dirty commutator, high mica, dirty or sticking brushes, defective connections between armature coils and commutator bars or open circuits are the chief causes of low speed and low current. Starter lock torque is eleven pound-feet.

Oiling.—Put 2 or 3 drops of light engine oil in each of starter bearings every month.

Generator.—Generator current regulation is by third brush system.

GENERATOR DATA. MODEL 105

Amperes	R. P. M.	M. P. H.
0	375	5
6-8	750	10
12-14	1125	15
13-15	1200	18
15-16	1500	20
13-14	1875	25
10-12	2250	30
10-12	2625	35

Charging rate may be varied by moving third brush. Moving brush in different direction of armature rotation will increase charging rate. Moving it in the opposite direction will decrease charging rate.

Oiling.—Put 5 or 6 drops of light engine oil in each of generator oilers every two weeks. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.

Relay.—There is no relay. The circuit between the generator and battery is controlled by the ignition switch. There is an overrunning clutch at driving end to allow generator to operate as a motor when battery pressure is above that of generator, thereby reducing the discharge current from the battery and in a measure acting as a relay.

Lamps.—Head lamps are 6-8 volt, 17 cp. Dimmer lamps are 6-8 volt, 5 cp. Dash lamp is 6-8 volt, 2 cp. Tail lamp is 6-8 volt, 2 cp.

Circuit Breaker.—There is a vibrating type circuit breaker to take the place of fuses in the lighting circuits. It should take 25 amperes to start this device vibrating, but operation in motion 3 to 5 amperes will cause it to continue.

VELIE

MODEL 38 (1918-19) AFTER FIRST 3000 CARS.

MODEL 39 (1919) SERIAL NOS. 40473 UP.

REMY GENERATING, STARTING AND LIGHTING SYSTEM.
REMY IGNITION.

Plate No. 319

BATTERY.—Battery is 6 volt, 80 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Breaker contacts separate .015 to .018 inch. When the condition of the points affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sand-paper.

OILING.—Refill the cup under the distributor head with soft cup grease and turn down two turns every two weeks. At the same time put a small amount of vaseline on the fiber bumper of the contact arm, using a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when dead center mark on flywheel is 1/2 inch past the indicator, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .025 inch.

STARTER:—Starter is connected to the engine through a Bendix drive. Starter Nos. 303-A and C are used on the Model 38. Model No. 303-B is used on Model 39 cars having Continental 7 N. engine and No. 299-C is used on cars having the 9 N. engine.

No.303 B and C.

No. 299 C.

Starter Data				Starter Data			
Torque	R. P. M.	Amperes	Volts	Torque	R. P. M.	Amperes	Volts
1 lb. ft.	1850	110-115	5.3-5.5	1 lb. ft.	1850	95-100	5.4-5.6

15 lb. ft.	Lock	550-575	3.3-3.4	19 lb. ft.	Lock	550-575	3.3-3.4

OILING.—Put 5 or 6 drops of light engine oil in each of starter bearing oilers every month.

GENERATOR.—Generator current regulation is by third brush system. A thermostat, located in the brush rigging of the generator, cuts in a resistance at a temperature of 175° F., reducing the maximum charging rate 6 amperes. Resistance also acts as a shunt field fuse. The thermostat is intended to change the charging rate as demand of seasons or car operations requires. Never touch the thermostat points. Generator No. 230-A is used on the Model No. 38, and No. 231-A-B on the Model No. 39-7 and 39 Sport.

Generator Test Data			Generator Test Data		
Amperes	R.P.M.	Volts	Amperes	R.P.M.	Volts
0.00	515	6.4	0.00	442	6.4
7.00	745	7.1	7.00	630	7.1

17.00	2500	8.2	13.72	2500	7.45
12.25	3000	7.8	7.5	3000	7.2

The above tests are to be made with relay in circuit and thermostat closed, but without ignition. Brush tension on main brushes is 17 to 20 ounces, and 13 to 17 ounces on third brush. Shunt field takes 5 amperes at 6.4 volts.

OILING.—Put 5 or 6 drops of light engine oil in each of generator oilers every two weeks. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.

RELAY.—Relay closes at 6-8 miles per hour and opens at 5-7 miles per hour. Gap between relay contacts is .012 to .015 inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sand-paper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 15 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are connected in series and are each 3-4 volt, 2 cp.

FUSES.—Fuses are 15 ampere.

Model 6-55 (1919)

Remy Generating, Starting and Lighting System
Remy Ignition

Battery.—Battery is 6 volt, 117 ampere-hour. The positive (+) terminal is grounded.

Ignition.—Breaker contacts separate .020 inch to .025 inch. When the condition of the points affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sand paper.

Timing.—Breaker contacts begin to separate when piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—Spark plug gaps are .025 to .030 inch.

Oiling.—Refill the cup under the distributor head with soft cup grease and turn down two turns every two weeks. At the same time put a small amount of vaseline on the fiber bumper of the contact arm, using a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

Starter.—Starter is connected to engine through a Bendix drive.

BATTERY.—Battery is 6 volt, 117 ampere-hour. The positive (+) terminal is grounded.
IGNITION.—Breaker contacts should separate .020 to .025 inch. When the condition of the contacts affects the ignition, resurface with a fine flat jeweler's file or worn No. 00 sandpaper. Ignition takes 3.5 amperes, engine stopped, contacts and switch closed.

TIMING.—Contacts begin to separate when the top dead center mark on the flywheel is $\frac{1}{2}$ inch before indicator, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .025 to .030 inch.

OILING.—Refill the cup under the distributor head with soft cup grease and turn down two turns every two weeks. Put a small amount of vaseline on the fiber bumper of the contact arm, using a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

STARTER.—Model No. 120. Starter is connected to the engine through a Bendix drive. When operating freely, starter current is 35 amperes at 3 volts, armature revolving 2200 R.P.M. With the same current starter runs 4500 R.P.M. at 5.5 volts, and at 5000 R.P.M. at 6 volts. The torque is $1\frac{1}{2}$ pound-feet at 1660 R.P.M., with $5\frac{3}{4}$ volts. Brush pressure on commutator is $2\frac{1}{4}$ pounds.

OILING.—Put 4 or 5 drops of light engine oil in each of the starter oilers every month.

GENERATOR.—Model No. 400. Generator current regulation is by third brush.

Generator Data		
Ampere Output	Generator R. P. M.	Miles Per Hour

4 lb. ft.	1000	265-275	4.6-4.9
5 lb. ft.	650	325-335	4.3-4.5
9 lb. ft.	Lock	540-560	3.5-3.65

Oiling.—Put 5 or 6 drops of light engine oil in each of starter oilers every six months.

Generator.—Generator current regulation is by third brush system. A thermostat located in the brush rigging of the generator, cuts in a resistance at a temperature of 175° F., reducing the maximum charging rate 6 amperes. Resistance also acts as a shunt field fuse. The thermostat is intended to change the charging rate as demand of seasons or car operation requires. Never touch the thermostat points.

GENERATOR DATA, MODEL 233-A

Amperes	R. P. M.	Volts
0	525	6.4
7	780	7.1
14	1100	7.8
19.5-20.5	1680	8.6
19.0-20	2000	8.6
13.0-15	3000	8

Above tests made with relay in circuit and thermostat points closed, but without ignition. Field windings draw 5 amperes at 6.4 volts. Brush tension on third brush is 13 to 17 ounces, and on main brushes, 17 to 20 ounces.

Oiling.—Fill generator bearing oil wells with light engine oil every month. If car is driven more than 1000 miles in a month, the oiling must be done every 1000 miles.

Relay.—Relay is No. 246-A, and is mounted on top of generator frame. It closes at 7-10 miles per hour and opens at 5-8 miles per hour. Air gap between relay contacts is .012 inch to .015 inch. Air gap between armature (moving member) and coil core is .012 inch to .015 inch, with contacts closed. Clean contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sand paper. Remove all grit. Adjust before again putting into service.

Lamps.—Head lamps are 6-8 volt, 17 cp. Tail and dash lamps are connected in series and are each 3-4 volt, 2 cp.

Hupmobile

Model R-19 (1919)

Remy Generating, Starting and Lighting System Atwater Kent Ignition

Battery.—Battery is 6 volt, 94 ampere-hour. The positive (+) terminal is grounded.

Ignition.—Contacts separate .005 inch to .008 inch. They are made of tungsten. When the condition of the points affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

Timing.—Contacts begin to separate when the top dead center mark on flywheel is 2 inches past indicator, spark control lever and breaker assembly midway between the fully advanced and fully retarded position.

Firing Order.—The firing order is 1, 2, 4, 3.

Spark Plug Gaps.—Spark plug gaps are .023 inch.

Oiling.—Put several drops of light engine oil in the oil hole, exposed when distributor cap is removed, every two weeks. At the same time put a very small amount of vaseline on the cam, applying with a toothpick. If car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

Starter.—Starter is connected to engine through a Bendix drive.

STARTER DATA, MODEL 305-E

Torque	R. P. M.	Amperes	Volts
1 lb. ft.	2500	110-130	5.4-5.6
2 lb. ft.	1900	165-175	5.1-5.4
3 lb. ft.	1500	215-225	4.8-5.2
4 lb. ft.	1000	265-275	4.6-4.9
5 lb. ft.	650	325-335	4.3-4.5
9 lb. ft.	Lock	540-560	3.5-3.65

Oiling.—Put several drops of light engine oil in each of starter oilers every month.

Generator.—Generator current regulation is by third brush system. A thermostat located in the brush rigging of the generator, cuts in a resistance at a temperature of 175° F., reducing the maximum charging rate 6 amperes. Resistance also acts as a shunt field fuse. The thermostat is intended to change the charging rate as demand of seasons or car operation requires. Never touch the thermostat points.

GENERATOR DATA, MODEL 234-C

Amperes	R. P. M.	Volts
0	525	6.4
7	780	7.1-7.2
14	1100	7.8
19.5-20.5	1680	8.6
19.0-20	2000	8.6
13.0-15	3000	8.0

Above tests must be made without ignition, relay in circuit and thermostat contacts closed. Ampere output may be varied by moving third brush. Moving third brush in direction of armature rotation increases the output. Moving it in the opposite direction decreases the output. Pressure of main brushes on commutator is 17 to 20 ounces. Pressure of third brush on commutator is 13 to 17 ounces. Shunt field takes 5 amperes at 6.4 volts.

Oiling.—Put 5 or 6 drops of light engine oil in each of generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Relay.—Relay closes at 8-10 miles per hour, or 550-600 R. P. M., of armature. Charging current is 1-3 amperes at closing and the discharge current 0-1 ampere at opening of relay contacts. The air gap between relay armature (moving member) and coil core is .012 inch to .015 inch. Contacts separate .012 inch to .015 inch. Clean relay contacts by drawing a piece of unglazed paper between them. If badly burned or pitted, resurface with a strip of well worn No. 00 sand paper, and then draw a piece of unglazed paper between them to remove all grit. Adjust before again putting into service.

Lamps.—Head lamps are 6-8 volt, 15 cp. Dash lamp is 6-8 volt, 2 cp. Tail lamp is 6-8 volt, 2 cp.

Fuses.—Fuses are 15 ampere.

Plate No. 324

Reo

Models T and U (1919)

Remy Generating, Starting and Lighting System

Remy Ignition

Battery.—Battery is 6 volt, 80 ampere-hour. The two wire system is used.

Ignition.—Breaker contacts separate .020 inch to .025 inch. When the condition of the points affects the ignition, resurface with a fine, flat jeweler's file or a strip of worn No. 00 sand paper.

Timing.—Breaker contacts begin to separate when mark "UDC 1 and 4" on the flywheel is 1 inch to 1 1/4 inches past indicator, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plug Gaps.—Spark plug gaps are .025 inch to .030 inch.

Oiling.—Refill the cup under the distributor head with soft cup grease and turn down two turns every two weeks. At the same time put a small amount of vaseline on the fiber bumper of the contact arm, using a toothpick. If car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

Starter.—Starter is connected to engine through a chain and an overrunning clutch.

STARTER DATA, MODEL 300-A

Torque	R. P. M.	Amperes	Volts
1 lb. ft.	780	65	6.0
3 lb. ft.	600	90	5.9
6 lb. ft.	460	120	5.7
8 lb. ft.	400	140	5.6
10 lb. ft.	360	160	5.5
68 lb. ft.	Lock	585	3.3

Oiling.—Put 4 or 5 drops of light engine oil in each of starter bearing oilers and lubricate chain well with light engine oil every month. Thoroughly clean out and repack starter reduction gear case with heavy grease once a season.

Generator.—Generator current regulation is by third brush system. A thermostat located in the brush rigging of the generator, cuts in a resistance at a temperature of 175° F., reducing the maximum charging rate 6 amperes. Resistance also acts as a shunt field fuse. The thermostat is intended to change the charging rate as demand of seasons or car operation requires. Never touch the thermostat points. Maximum charging rate is reached at 15 miles per hour.

GENERATOR DATA, MODEL 254-A

High Battery			Low Battery		
Amperes	R. P. M.	Volts	Amperes	R. P. M.	Volts
0	350	6.4	0	330	5.9
7	510	7.1	7	500	6.2
13	690	7.7	13	600	6.6
20	1100-1500	9.0	18	1000-1200	6.8

Above tests must be made without ignition and with thermostat closed. When operating freely as a motor, generator takes 4.75 amperes at 6.4 volts, armature revolving at 245 R. P. M. Shunt field takes 5.0 amperes at 6.4 volts.

Oiling.—Put 4 or 5 drops of light engine oil in each of generator oilers every two weeks. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.

Relay.—Relay closes at 7-10 miles per hour or 350-400 R. P. M., of armature. Charging current is 1 to 3 amperes at closing and the discharge current 0 to 1 ampere at opening of relay. Relay contacts separate .012 inch to .015 inch. Air gap between relay armature and coil core is .012 inch to .015 inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sand paper. Remove all grit. Adjust before again putting into service.

Lamps.—Head lamps are 6-8 volt, 15 cp. Dash and tail lamps are in series. They are each 3-4 volt, 2 cp.

Fuses.—Fuses are 5 ampere. Use commercial 5 ampere fuse wire when making replacements.

AUBURN MODEL 6-39 (1919) REMY GENERATING, STARTING AND LIGHTING SYSTEM REMY IGNITION

BATTERY.—Battery is 6 volt, 117 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Breaker contacts separate .020 inch to .025 inch. If burned or pitted, affecting the ignition, resurface with a very fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Refill the cup under the distributor head with soft cup grease and turn down two turns every two weeks. Put a small amount of vaseline on the fiber bumper of the contact arm, using a toothpick. If car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .025 to .030 inch.

STARTER.—Model 292-A. Starter is connected to the engine through a Bendix drive.

Starter Data			
Torque	R.P.M.	Amperes	Volts
0 lb. ft.	3300	60	6.0
1 lb. ft.	2400	110	5.7
4 lb. ft.	1000	270	4.6
7 lb. ft.	225	395	3.7
9 lb. ft.	50	435	3.6
10-11 lb. ft.	Lock	450	3.6

OILING.—Put 5 or 6 drops of light engine oil in each of the starter oilers every month.

GENERATOR.—Model 245-D. Generator current regulation is by vibrating regulator.

Generator Data		
Amperes	R.P.M.	Volts
0	700	6
7	800	6.5
13-14	1500	7
13.14	3000	7

When operating freely as a motor, the current is 5 to 5.5 amperes at 5.8 volts, armature revolving at 400 R.P.M. Shunt field current is 3.5 to 4 amperes at 6 volts.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY-REGULATOR.—Relay closes at 8-10 miles per hour and opens at 6-8 miles per hour. The air gap between relay armature (moving member) and coil core is .012 to .015 inch, contacts closed. Contacts separate .012 inch to .015 inch. Clean relay and regulator contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service. Increasing spring tension on regulator armature increases the output. Decreasing the spring tension decreases the output.

LAMPS.—Head lamps are 6-8 volt, 15 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash lamp is 6-8 volt, 2 cp. Tail lamp is 6-8 volt, 2 cp.

FUSE.—Fuse is 25 ampere.

Auburn

Models 6-39-H and 6-39-K (1919)

Remy Generating, Starting and Lighting System

Remy Ignition

Battery.—Battery is 6 volt, 117 ampere-hour. The positive (+) terminal is grounded.

Ignition.—Breaker contacts separate .020 inch to .025 inch. When the condition of the points affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sand paper.

Timing.—Breaker contacts begin to separate when piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—Spark plug gaps are .027 to .030 inch.

Oiling.—Refill the cup under the distributor head with soft cup grease and turn down two turns every two weeks. At the same time put a small amount of vaseline on the fiber bumper of the contact arm, using a toothpick. If the car is driven more than 500 miles in two weeks, these attentions should be given every 500 miles.

Starter.—Starter is connected to engine through a Bendix drive.

STARTER DATA, MODEL 303-A

Torque	R. P. M.	Amperes	Volts
1 lb. ft.	1850	110-115	5.3-5.5
2 lb. ft.	1400	158-165	5.1-5.3

MODEL B (1919)

WAGNER GENERATING, STARTING AND LIGHTING SYSTEM ATWATER-KENT IGNITION

BATTERY.—Willard, Type S-J-W-3. 6 volt, 90 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Breaker contacts separate .005 to .008 inch. They are made of tungsten. When the condition of the points affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING.—Every two weeks remove the distributor cap and put several drops of light engine oil in the oil hole exposed.

TIMING.—Breaker contacts begin to separate when piston entering power stroke is on top dead center, spark control $\frac{1}{2}$ inch from the fully retarded position.

FIRING ORDER.—The firing order is 1, 4, 2, 6, 3, 5.

SPARK PLUG GAPS.—Spark plug gaps are .025 inch.

STARTER.—Model E.M.-218, Type 35-T. Starter is connected to the engine through a Bendix drive.

OILING.—Put 5 or 6 drops of light engine oil in each of starter bearing oilers every month.

GENERATOR.—Model E.M.-165, Type 41-Y. Generator current regulation is by third brush system. Rotation is counter-clockwise, viewed from commutator end. Maximum current output of 15 amperes is reached at 1650 R.P.M. of armature, or 20 miles per hour.

Generator Data

Amperes	R.P.M.
4.0	800
9.0	1000
12.0	1200
14.5	1500
15.0	1650
14.0	2000
11.0	2500
8.5	3000

OILING.—Put 5 or 6 drops of light engine oil in each of generator bearing oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 8-10 miles per hour and opens at 6-8 miles per hour. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are connected in series and are each 3-4 volt, 2 cp.

FUSES.—Fuses are 30 ampere.

STUTZ 1916-17-18-19.

REMY GENERATING, STARTING AND LIGHTING SYSTEM BOSCH OR DELCO IGNITION

Plate No. 328

BATTERY.—Battery is 6 volt, 115-130 ampere-hour. The two-wire system is used. The negative (—) terminal is grounded at center terminal of junction block.

IGNITION.—Delco. Battery breaker contacts separate .018 inch. There are two separate coils and distributors and two sets of breaker contacts, supplying a separate ignition system for each set of plugs. They are made of tungsten. When the condition of the points affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

IGNITION.—Bosch. Magneto breaker contacts separate .014 to .016 inch. When the condition of the points affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Delco. Put several drops of light engine oil in ignition unit oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles. Every six months remove the plug in distributor gear housing and inject a quantity of grease.

OILING.—Bosch. Put several drops of light engine oil in each of magneto oilers every month. If car is driven more than 1000 miles in a month, the oiling must be done every 1000 miles.

TIMING.—Magneto breaker contacts begin to separate when piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position. Battery breaker contacts begin to separate when piston entering power stroke is on top dead center, spark control lever advanced 1½ inches from the fully retarded position.

FIRING ORDER.—The firing order is 1, 3, 4, 2.

SPARK PLUG GAPS.—Spark plug gaps with Delco ignition are .030 inch. Spark plug gaps with Bosch ignition are .020 to .025 inch.

STARTER.—Model No. 189-A is used on the 1916-17 cars and No. 291-A is used on the 1918 cars. Starter is connected to the engine through a Bendix drive. Starter current is 40-56 amperes at 5.8-6 volts, armature revolving at 3600-4200 R.P.M. Lock torque is 19-22 pound-feet, current 700-720 amperes at 3.6 volts.

OILING.—Put 4 or 5 drops of light engine oil in each of starter oilers every month.

GENERATOR.—Model OD. Generator current regulation is by third brush system.

Amperes	Generator Data	R.P.M.
0.		300 or less
7.5		500
14-18		1000-1300
12		2050

On generators before Serial No. 30,000, the armature current is 4 amperes and the field current 1.7 amperes, at 6.5 volts. After serial No. 30,000, the armature current is 12 amperes and the field current 1.3 amperes, at 6.5 volts. Maximum charging rate is reached at 20-25 miles per hour. The charging rate may be slightly decreased by filing away the edge of the third brush nearest the nearest main brush. Filing the opposite edge will increase the charging rate. Only a small portion of the third brush may be so removed however, or serious sparking will result.

OILING.—Put 4 or 5 drops of light engine oil in each of generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 8-10 miles per hour, or 300-350 R.P.M. of armature, and opens at 6-8 miles per hour or 250-300 R.P.M. of armature. Charging current is .5 to 1.5 amperes at closing and the discharge current 0 to 1 ampere at opening of relay. Air gap between relay armature (moving member) and coil core is .040 inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 18 cp. Dimmer lamps are 6-8 volts, 4 cp. Spot lamp is 6-8 volt, 6 cp. Dash lamp is 6-8 volt, 4 cp. Tail lamp is 6-8 volt, 2 cp.

FUSES.—Fuses are 15 ampere.

Chevrolet

MODEL D, 8 CYLINDER (1918-19) AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM REMY IGNITION

This Page Applies to First 1000 Cars

BATTERY.—Battery is 6 volt, 115 ampere-hour. The negative (—) terminal is grounded at the starting motor.

IGNITION.—Breaker contacts separate .020 to .025 inch. When condition of contacts affects the ignition, resurface with a fine flat jeweler's file or worn No. 00 sandpaper.

OILING.—Refill the cup under the distributor head with soft cup grease and turn down two turns every two weeks. At the same time put a small amount of vaseline on the fiber bumper of the contact arm, using a toothpick. If the car is driven more than 500 miles in two weeks, these attentions should be given every 500 miles.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1R, 4L, 2R, 3L, 4R, 1L, 3R, 2L.

SPARK PLUG GAPS.—Spark plug gaps are .025 inch to .030 inch.

STARTER.—Model ME. Starter is connected to the engine through a Bendix drive.

Starter Data

Torque	R.P.M.	Amperes
1 lb. ft.	1960	80
3 lb. ft.	1100	160
5 lb. ft.	800	220
7 lb. ft.	500	280
9 lb. ft.	230	340
13 lb. ft.	Lock	470

OILING.—Starter bearings are packed with soft cup or ball bearing grease. Thoroughly clean out and repack every 6 months.

GENERATOR.—Model GH. Generator current regulation is by third brush system.

Ampere	Generator Data	R.P.M.
5.00		760-820
10.00		1020-1100
12.50		1200-1300
15.00		1460-1675
15-16		1950-2250

When generator is operating freely as a motor, current is 2.7 amperes, armature revolving at 450 R.P.M. Shunt field current is 1.7 amperes.

OILING.—Put several drops of light engine oil in each of generator oilers every two weeks. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.

RELAY.—Relay closes at 8-10 miles per hour or 550-600 R.P.M. of armature and opens at 5-8 miles per hour or 450-500 R.P.M. of armature. Charging current is .5 to 1.5 amperes at closing and the discharge current, 0-1 ampere at opening of relay. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 15 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash lamp is 6-8 volt, 2 cp. Tail lamp is 6-8 volt, 2 cp.

FUSES.—Fuses are 20 ampere.

REMY IGNITION

This Page Applies After First 1000 Cars

BATTERY.—Battery is 6 volt, 115 ampere-hour. The negative (—) terminal is grounded at the starting motor.

IGNITION.—Breaker contacts separate .020 to .025 inch. When condition of contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Refill the cup under the distributor head with soft cup grease and turn down two turns every two weeks. Put a small amount of vaseline on the fiber bumper of the contact arm, using a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly fully retarded.

FIRING ORDER.—The firing order is 1R, 4L, 2R, 3L, 4R, 1L, 3R, 2L.

SPARK PLUG GAPS.—Spark plug gaps are .025 to .030 inch.

STARTER.—Model ME. Starter is connected to the engine through a Bendix drive.

Starter Data

Torque	R.P.M.	Amperes
1 lb. ft. —	1960 —	80
3 lb. ft. —	1100 —	160
5 lb. ft. —	800 —	220
7 lb. ft. —	500 —	280
9 lb. ft. —	230 —	340
13 lb. ft. —	Lock —	470

OILING.—Starter bearings are packed with soft cup or ball bearing grease. Thoroughly clean out and repack every six months.

GENERATOR.—Model GH. Generator current regulation is by third brush system.

Generator Data

Amperes	R.P.M.
5.00 —	760-820
10.00 —	1020-1100
12.50 —	1200-1300
15.00 —	1460-1675
15-16 —	1950-2250

When generator is operating freely as a motor, current is 2.7 amperes, armature revolving at 450 R.P.M. Shunt field current is 1.7 amperes.

OILING.—Put several drops of light engine oil in each of generator oilers every two weeks. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.

RELAY.—Relay closes at 8-10 miles per hour or 550-600 R.P.M. of armature and opens at 5-8 miles per hour or 450-500 R.P.M. of armature. Charging current is .5 to 1.5 amperes at closing and the discharge current, 0-1 ampere at opening of relay. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 15 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash lamp is 6-8 volt, 2 cp. Tail lamp is 6-8 volt, 2 cp.

FUSES.—Fuses are 20 amperes.

Plate No. 334

Plate No. 335

ROAMER

MODELS D-4-74 AND C-6-54 (1918-19) (SERIAL NOS. 15737 UP)
BIJUR GENERATING, STARTING AND LIGHTING SYSTEM
BOSCH IGNITION

BATTERY.—Battery is 6 volt, 85 or 130 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Breaker contacts separate .014 to .016 inch. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Put 2 or 3 drops of light machine oil in each of the magneto oilers every month. Put a small amount of vaseline on the fiber bumper of the contact arm, applying with a toothpick. If the car is driven more than 1000 miles in a month, these attentions must be given every 1000 miles.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4, or 1, 2, 4, 3.

SPARK PLUG GAPS.—Spark plug gaps are .018 to .022 inch.

STARTER.—E.D.-160, M-979, or C-8, M-1055. Rotation is counter-clockwise, looking at commutator end. Starter is connected to the engine through a Bendix drive.

OILING.—Put several drops of light engine oil in each of the starter bearings every month.

GENERATOR.—Type L-61, M-768, or M-1087. Rotation is counter-clockwise, looking at commutator end. Generator current regulation is by third brush system. Maximum current output is 15 amperes, reached at 20 miles per hour or 1400 R.P.M. of the armature. Charging rate is varied by inserting a special toothed wrench in the adjusting hole in the commutator end plate and shifting the third brush assembly through a ratchet engagement. Turn the adjusting wrench to the right (facing commutator end) to increase the charging rate. Maximum current output must not exceed 15 amperes at 1400-1600 R.P.M. Pressure of brushes on commutator is 14 ounces. There is a 10 ampere fuse mounted on the generator frame to protect the field winding should excessively high resistance occur in the charging circuit.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 8-9 miles per hour or 550-600 R.P.M. of the armature and opens at 7-8 miles per hour or 500-550 R.P.M. of the armature. Relay contacts separate .045 inch. Air gap between relay armature (moving member) and coil core is .035 inch, contacts closed. To adjust relay, connect a voltmeter across the main brushes of the generator. Then insert a special wrench in the small adjusting hole in the commutator end plate and adjust relay spring tension until the contacts close when the voltage reaches 6.5 volts. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 18 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp.

OAKLAND

MODEL 34-B (1918-19) (SERIAL NOS. 3,000,134 UP)

REMY GENERATING, STARTING AND LIGHTING SYSTEM

REMY IGNITION

BATTERY.—Prest-O-Lite, Type 611-RH1, 6 volt, 60 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 284-C. Distributor Model No. 256-AC. Breaker contacts separate .020 to .025 inch. If burned or pitted, affecting the ignition, resurface them with a very fine, flat jeweler's file or a strip of worn No. 00 sandpaper.

OILING.—Refill the cup under the distributor head with soft cup grease and turn down two turns every two weeks. At the same time put a small amount of vaseline on the fiber bumper of the contact arm, using a toothpick. If the car is driven more than 500 miles in two weeks, these attentions should be given every 500 miles.

TIMING.—Contacts begin to separate when the top dead center mark on flywheel is $\frac{1}{8}$ inch before the indicator on the 1919 cars and at the indicator on the 1918 cars with the spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .025 to .030 inch.

STARTER.—Model 307-A. Starter is connected to engine through a Bendix drive.

Starter Data

Torque	R.P.M.	Amperes	Volts
1.00 lb. ft. ———	2150 ———	140-150 ———	5.5-5.7
2.00 lb. ft. ———	1650 ———	180-190 ———	5.2-5.4
3.00 lb. ft. ———	1300 ———	220-230 ———	4.8-4.9
4.00 lb. ft. ———	1050 ———	258-268 ———	4.3-4.5
5.00 lb. ft. ———	750 ———	300-310 ———	4.1-4.3
12.75 lb. ft. ———	Lock ———	570-590 ———	3.4-3.6

GENERATOR.—Model 234-A. Generator current regulation is by third brush system. A thermostat located in the brush rigging of the generator cuts in a resistance at a temperature of 175°F., reducing the maximum charging rate 6 amperes. Resistance also acts as a shunt field fuse. The thermostat is intended to change the charging rate as demand of seasons or car operation requires. Never touch the thermostat points.

Generator Data

Amperes	R.P.M.	Volts
0 ———	525 ———	6.4
7 ———	780 ———	7.1-7.2
14 ———	1100 ———	7.8
19-20 ———	1680 ———	8.6
19-20 ———	2000 ———	8.6
13-15 ———	3000 ———	8.0

Above tests should be made with relay in circuit and thermostat contacts closed. Field current is 5 amperes at 6.4 volts. Pressure of main brushes on commutator is 17 to 20 ounces. The pressure of third brush on commutator is 13 to 17 ounces.

OILING.—Fill generator bearing oilers with light engine oil every month. If car is driven more than 1000 miles in a month, the oiling must be done every 1000 miles.

RELAY.—Relay closes at 7-10 miles per hour or 525-575 R.P.M. of armature and opens at 5-8 miles per hour or 475-525 R.P.M. of armature. Contacts separate .012 to .015 inch. Air gap between armature coil and core is .012 to .015 inch, with contacts closed. Clean relay contacts by drawing a piece of unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 15 cp. Dash lamp is 6-8 volt, 2 cp. Tail lamp is 6-8 volt, 2 cp. On the 1918 cars head lamps are 6-8 volt 17 cp.

Plate No. 337

MODEL B (1919)

BATTERY.—Battery is 6 volt, 110 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Type CC. Breaker contacts separate .006 inch. They are made of tungsten. When the condition of the points affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone. Ignition coil takes 3¼ to 4 amperes, engine idle, breaker contacts and ignition switch closed.

OILING.—Every two weeks remove the distributor cap and put several drops of light engine oil in the oil hole exposed. Put a small amount of vaseline on the cam, applying with a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when piston entering power stroke is on top dead center, spark control lever and breaker assembly in fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .025 inch.

STARTER.—Frame No. 100. Starter is connected to the engine through a Bendix drive. Torque is 1¾ pound-feet at 1600 R. P. M. Lock torque is 12 pound-feet, current 475 amperes. Starter cranks the engine at 125 R.P.M., taking 250 amperes.

OILING.—Put 5 or 6 drops of light engine oil in each of starter bearing oilers every month.

GENERATOR.—Frame No. 150. Generator current regulation is by third brush system. Maximum charging rate is 10-14 amperes, reached at 15-20 miles per hour, or 1600 R.P.M. of armature.

OILING.—Put 5 or 6 drops of light engine oil in each of generator bearing oilers every two weeks. If car is driven more than 500 miles in two weeks the oiling must be done every 500 miles.

RELAY.—Relay closes at 7-8 miles per hour or 500 R.P.M. of armature, and opens at 5-6 miles per hour or 450 R.P.M. of armature. Relay contacts separate .064 inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are each 3-4 volt, 2 cp.

FUSE.—Main fuse is 15 ampere. Field fuse is 5 ampere.

Plate No. 338

Grant

MODEL G (1918-19)

WAGNER GENERATING, STARTING AND LIGHTING SYSTEM

REMY IGNITION

BATTERY.—Willard, Type S-J-W-3. 6 volt, 90 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Coil No. 284-B. Distributor No. 352-A. Breaker contacts separate .020 to .025 inch. When the condition of the points affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Refill the cup under the distributor head with soft cup grease and turn down two turns every two weeks. Put a small amount of vaseline on the fiber bumper of the contact arm, using a toothpick. If the car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.

TIMING.—Breaker contacts begin to separate when flywheel marking "No. 1-6-T.C." is $\frac{3}{4}$ inch beyond the indicator, spark control button pulled out one-half of its stroke ($\frac{3}{8}$ inch). First see that the breaker assembly is in the fully retarded position when the control button is pushed all the way in.

FIRING ORDER.—The firing order is 1, 4, 2, 6, 3, 5.

SPARK PLUG GAPS.—Spark plug gaps are .025 inch.

STARTER.—Model EM-199, Type 35-T. Starter is connected to the engine through a Bendix drive.

OILING.—Put 5 or 6 drops of light engine oil in each of the starter bearing oilers every month.

GENERATOR.—Model E.M.-189, Type 45-W. Generator current regulation is by third brush system. Rotation is counter-clockwise, viewed from commutator end. Maximum current output of 17 amperes is reached at 20 miles per hour.

Amperes	Generator Data.	R.P.M.

REMY SYSTEM

Plate No. 339

SERIES X (1919)

WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM
BOSCH AND WESTINGHOUSE IGNITION

BATTERY.—Battery is 6 volt, 120 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Bosch magneto. Breaker contacts separate .014 to .016 inch. When the condition of the points affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

IGNITION.—Westinghouse. Breaker contacts separate .008 inch. When the condition of the points affects the ignition, resurface with a fine flat, jeweler's file or worn No. 00 sandpaper. Adjust the distributor brush springs so that the brushes extend 1/4 inch from their holders when the distributor cap is removed, retaining them, however, so that they do not fall out. Brushes must move freely in their holders. See that the brushes on the top and bottom of the rotor are in place when installing rotor.

OILING.—Put 2 or 3 drops of light engine oil in each of the magneto oilers and put 2 or 3 drops of light engine oil in the oil cup at the side of the battery ignition unit every month. If the car is driven more than 1000 miles in a month, the oiling must be done every 1000 miles.

TIMING.—Battery breaker contacts begin to separate when dead center line on flywheel rim is 1/2 inch before the indicator, and magneto breaker contacts begin to separate when the dead center line on flywheel is at the indicator, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .025 inch.

STARTER.—Frame No. 775. Starter is connected to the engine through a magnetic pinion shift. Starter cranks the engine at 75 R.P.M.

Starter Data

Torque	R.P.M.	Amperes	Volts
4.0 lb. ft.	1000	160	5.6
8.0 lb. ft.	600	245	5.0
12.0 lb. ft.	490	320	4.8
16.0 lb. ft.	200	390	4.6
22.5 lb. ft.	Lock	500	4.5

OILING.—Put 4 or 5 drops of light engine oil in each of starter bearing oilers every month.

GENERATOR.—Frame No. 400-R. Generator voltage regulation is by vibrator regulator. Maximum charging rate is 15-20 amperes, at 25 miles per hour with discharged battery. Charging rate decreases as battery becomes charged.

OILING.—Put 4 or 5 drops of light engine oil in each of generator bearings every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY-REGULATOR.—Relay closes at 575 R.P.M. of armature, or 8-10 miles per hour. Generator current at closing of relay is .5 to 1 ampere. Relay opens at 7-9 miles per hour, with a reverse current of 0-3 amperes. Relay is adjusted by bending the two brass prongs (Plate 473A). Position of the inner prong determines the spring tension, while the other prong determines the air gap between coil core and moving member. The air gap is .005 to .010 inch. Regulator is adjusted by turning thumb screw. Turn in a clockwise direction to increase the generator output and in a counter clockwise direction to decrease it. Clean relay and regulator contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well-worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp.

FUSES.—Fuses are 15 ampere.

PATERSON

MODEL 6-42 (1916), 6-45, 6-45-R (1917-18) 6-46 (1919) DELCO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

BATTERY:—(1916, 17-18) 6 volt, 85 ampere hour (1919) 6 volt, 110 ampere hour. The negative (—) terminal is grounded.

IGNITION:—Breaker contacts separate .020 inch. They are made of tungsten. When the condition of the points affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING:—Distributor shaft bearings are of the oilless type. If the rotor button and its track in the distributor head are not well polished, apply a small amount of vaseline with a soft cloth.

TIMING:—Breaker contacts begin to separate when piston entering power stroke is on top dead center, spark control lever one third advanced on 1919 cars, in the fully retarded position on the 1918 cars, and when the mark on the flywheel is 1 3/4 past indicator with breaker assembly fully retarded on the 1916 and 17 cars.

Firing Order:—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps:—Spark plug gaps are .030 inch.

STARTER:—Models 85, 100, 104, 160. Starter is connected to engine through a Bendix drive. Running freely, starter takes 40 amperes. Lock torque is 16 pound feet at 3-5 to 3-8 volts.

Oiling:—Model 104 and 106 have oil bearings and require no attention. On Models 85 and 100, put a few drops of light engine oil in each oiler every month.

GENERATOR:—Models 84, 103, 105. Current regulation is by third brush system. Generator begins to supply current at 6-8 miles per hour or 500 R.P.M. of armature and reaches its maximum output at 18-22 miles per hour, or 1400 R.P.M. of armature.

Hot Test		Generator Data		Cold Test	
Amperes	R.P.M.	Amperes	R.P.M.	Amperes	R.P.M.
Neutral	500	Neutral	500	Neutral	500
10-12	900	10.5-12.5	900	10.5-12.5	900
14-16	1400	15.5-18.0	1400	15.5-18.0	1400
11-13	2000	13.0-17.0	2000	13.0-17.0	2000

To increase charging rate loosen the two screws holding third brush arm and move third brush in a counter-clockwise direction (looking at commutator end). To decrease charging rate move third brush in a clockwise direction. Brush must be re-seated after adjusting position.

OILING:—Put 5 or 6 drops of light engine oil in each of generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY:—There is no relay. The circuit between the generator and the battery is controlled by the ignition switch. The overrunning clutch at driving end allows generator to operate as a motor when battery's pressure is above that of generator. If engine is killed when stopping, the noise made by the clutch serves to attract the operator's attention to open the ignition switch. The opening and closing of the generator-battery circuit by the operator takes the place of the relay.

LAMPS:—Head lamps are 6-8 volt, 15 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp. On 1916-17-18 cars, head lamps are 6-8 volt, 12 or 14 cp. Dash and tail lamps are 3-4 volt, 2 cp.

Note:—On Model 84, generator field is connected to the ungrounded main brush.

Plate No. 342

OLDSMOBILE

MODEL 45-B (1919)

DELCO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

BATTERY.—Battery is 6 volt, 80 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 2162. Switch No. 1146. Breaker contacts separate .020 inch. They are made of tungsten. When the condition of the points affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING.—Put several drops of light engine oil in the oil cup at side of breaker unit every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

TIMING.—Breaker contacts begin to separate when piston entering power stroke is on top dead center, spark control lever two inches from the top of the sector. (First see that the breaker assembly is fully retarded when the control lever is in the fully retarded position.)

FIRING ORDER.—The firing order is 1R, 4L, 3R, 2L, 4R, 1L, 2R, 3L.

SPARK PLUG GAPS.—Spark plug gaps are .030 inch.

STARTER.—Model No. 72. Starter is connected to the engine through a Bendix drive. Lock torque is 17.5 pound-feet, at 3.5 to 3.8 volts. Operating freely, starter current is 40 amperes.

OILING.—Put several drops of light engine oil in starter bearings every month.

GENERATOR.—Model No. 137. Current regulation is by third brush system. Generator begins to supply current at 500-550 R.P.M. of armature or 8 miles per hour. Maximum current output of 14-16 amperes is reached at 1400 R.P.M. or 22 miles per hour.

Amperes	Generator Data	R.P.M.
Neutral		500
10-12		900
14-16		1400
11-13		2000

To increase charging rate loosen the two screws holding third brush arm and move third brush in a counter-clockwise direction (looking at commutator end). To decrease charging rate move third brush in a clockwise direction. Brush must be reseated after adjusting position.

OILING.—Put 5 or 6 drops of light engine oil in each of generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—There is no relay. The circuit between the generator and the battery is controlled by the ignition switch. The overrunning clutch at driving end allows generator to operate as a motor when battery's pressure is above that of generator. If engine is killed when stopping, the noise made by the clutch serves to attract the operator's attention to open the ignition switch. The opening and closing of the generator-battery circuit by the operator takes the place of the relay.

LAMPS.—Head lamps are 6-8 volts, 15 cp. Dimmer lamps are 6-8 volts, 4 cp. Dash and tail lamps are 6-8 volts, 2 cp.

CIRCUIT-BREAKER.—A vibrating circuit breaker takes the place of fuses. It requires 25 amperes to start this device vibrating. While vibrating, the current is 3-5 amperes.

MODELS S-2 T, S-4 T, S-4 R, S-4 S (1917-18) Y-18 (1918-19) WAGNER GENERATING, STARTING AND LIGHTING SYSTEM REMY IGNITION

BATTERY.—Exide, Type XC-13-1, 6 volt, 80 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Breaker contacts separate .020 to .025 inch. When the condition of the points affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Refill the cup under the distributor head with soft cup grease and turn down two turns every two weeks. Put a small amount of vaseline on the fiber bumper of the contact arm, using a toothpick. If the car is driven more than 500 miles in two weeks, these attentions should be given every 500 miles.

TIMING.—Breaker contacts begin to separate when the "D.C." mark on flywheel is one inch past the indicator, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .025 inch.

STARTER.—Model E.M.-167, Type 36-T. Starter is connected to the engine through a Bendix drive. Starter cranks the engine at 125 R.P.M., taking 160 amperes. Operating freely, armature revolves at 8000 R.P.M., current 60-90 amperes. Lock torque is 11.5 pound-feet, current 475 amperes.

OILING.—Put 5 or 6 drops of light engine oil in each of starter bearing oilers every month.

GENERATOR.—Model E.M.-155, Type 41-W. Generator current regulation is by third brush system. Rotation is clockwise, looking at commutator end. Maximum current output of 16 amperes is reached at 2200 R.P.M. of armature or 20 miles per hour.

Amperes	Generator Data	R.P.M.
12.0		1500
15.5		2000
16.0		2200
15.4		2500
13.0		3000

OILING.—Put 5 or 6 drops of light engine oil in each of generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 8-10 miles per hour and opens at 6-8 miles per hour. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volts, 15 cp. Tail and dash lamps are 6-8 volt, 2 cp.

FUSES:—Fuses are 15 or 20 ampere

Plate No. 344

WESTCOTT

MODEL A-48 (1919) SERIAL NOS. 8101 UP DELCO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

BATTERY.—Willard, Type LBA-6-6, 6 volt, 108.5 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 2159. Distributor Model No. 5157. Breaker contacts separate .020 inch. They are made of tungsten. When the condition of the points affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING.—Put 4 or 5 drops of light engine oil in the oiler at side of breaker unit every two weeks. If rotor button and its track are not well polished, apply a small amount of vaseline with a soft cloth. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when piston entering power stroke is on top dead center, spark control advanced one-third.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .030 inch.

STARTER.—Model No. 136. Starter is connected to the engine through a Bendix drive. Running freely, starter armature revolves at 4500 R.P.M., current 35 amperes at 3.5 volts.

OILING.—Starter bearings are of the oilless type.

GENERATOR.—Model No. 135. Generator current regulation is by third brush system. Generator begins to supply current at 7 miles per hour or 500-550 R.P.M. of armature, and reaches its maximum current output of 14-16 amperes at 18-25 miles per hour, or 1400 R.P.M. of armature.

Hot Test		Generator Data		Cold Test	
Amperes	R.P.M.			Amperes	R.P.M.
Neutral	500			Neutral	500
10-12	900			10.5-12.5	900
14-16	1400			15.5-18.0	1400
11-13	2000			13.0-17.0	2000

To increase the charging rate, loosen the two screws holding the third brush arm and move the third brush in a counter-clockwise direction (looking at commutator end). To decrease the charging rate move the third brush in a clockwise direction. Brush must be reseated after adjusting position.

OILING.—Put 5 or 6 drops of light engine oil in each of generator bearing oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—There is no relay. The circuit between the generator and the battery is controlled by the ignition switch.

LAMPS.—Head lamps are 6-8 volt, 18 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp.

CIRCUIT BREAKER.—A vibrating circuit breaker takes the place of fuses. It requires 25 amperes to start this device vibrating. While vibrating, the current is 3-5 amperes.

COMBINATION SWITCH.—Model No. 1142.

DELCO GENERATING, STARTING AND LIGHTING SYSTEM

DELCO IGNITION

BATTERY.—Willard, Type LBA-6-6, 6 volt, 108.5 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 2158. Breaker contacts separate .020 inch. They are made of tungsten. When the condition of the points affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING.—Distributor shaft bearings are of the oilless type. If the rotor button and its track are not well polished, apply a small amount of vaseline with a soft cloth.

TIMING.—Breaker contacts begin to separate when piston entering power stroke is on top dead center, spark control advanced one-third.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .030 inch.

STARTER.—Model No. 106. Starter is connected to the engine through a Bendix drive. Lock torque is 16 pound-feet, at 3.5-3.8 volts. Running freely, starter current is 40 amperes.

OILING.—Starter bearings are of the oilless type.

GENERATOR.—Model No. 105. Generator current regulation is by third brush system. Generator begins to supply current at 7 miles per hour or 500-550 R.P.M. of armature, and reaches its maximum current output of 14-16 amperes at 18-25 miles per hour, or 1400 R.P.M. of armature.

Generator Data

Amperes	R.P.M.	Amperes	R.P.M.
Neutral	500	Neutral	500
10-12	900	10.5-12.5	900
14-16	1400	15.5-18.0	1400
11-13	2000	13.0-17.0	2000

To increase the charging rate, loosen the two screws holding the third brush arm and move the third brush in a counter-clockwise direction (looking at commutator end.) To decrease the charging rate move the third brush in a clockwise direction. Brush must be reseated after adjusting position.

OILING.—Put 5 or 6 drops of light engine oil in each of generator bearing oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—There is no relay. The circuit between the generator and the battery is controlled by the ignition switch.

LAMPS.—Head lamps are 6-8 volt, 18 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp.

CIRCUIT BREAKER.—A vibrating circuit breaker takes the place of fuses. It requires 25 amperes to start this device vibrating. While vibrating the current is 3-5 amperes.

COMBINATION SWITCH.—Model No. 1145.

Plate No. 346

COLE

MODEL 870 (1919) (SERIAL NOS. 51001 TO 54000) DELCO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

BATTERY.—Battery is 6 volt, 125 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 2162. Breaker contacts separate .018. They are made of tungsten. When the condition of the points affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING.—Put 4 or 5 drops of light engine oil in each of distributor shaft bearing oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

TIMING.—Breaker contacts begin to separate when piston on compression stroke is $1\frac{1}{2}$ inches from top dead center, spark control lever and breaker assembly in the fully advanced position.

FIRING ORDER.—The firing order is 1R, 4L, 3R, 2L, 4R, 1L, 2R, 3L.

SPARK PLUG GAPS.—Spark plug gaps are .030 inch.

STARTER.—Model No. 72. Starter is connected to the engine through a Bendix drive. Lock torque is 17.5 pound-feet, at 3.5-3.8 volts. Running freely, starter current is 40 amperes.

OILING.—Starter bearings are of the oilless type.

GENERATOR.—Model No. 138. Generator current regulation is by third brush system. Generator begins to supply current at 7 miles per hour or 500 R.P.M. of armature and reaches its maximum current output of 14-16 amperes at 18-25 miles per hour or 1400 R.P.M. of armature.

Amperes	Generator Data	R.P.M.
Neutral		500
10-12		900
14-16		1400
11-13		2000

To increase the charging rate loosen the two screws holding third brush arm, and move third brush in a counter-clockwise direction (looking at commutator end). To decrease charging rate, move third brush in a clockwise direction. Brush must be re-seated after adjusting position.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—There is no relay. The circuit between the generator and battery is controlled by the ignition switch.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dimmer lamps are 6-8 volt, 5 cp. Dash and tail lamps are each 6-8 volt, 4 cp. Dome lamp is 6-8 volt, 4 cp. Corner lamps are 6-8 volt, 2 cp.

CIRCUIT BREAKER.—A vibrating circuit breaker takes the place of fuses. It requires 25 amperes to start this device vibrating. While vibrating, the current is 3-5 amperes.

COMBINATION SWITCH.—Model No. 1132.

STEPHENS

MODELS 70, 74, 75, 78 (1918) AND 70, 75 (1919) SERIAL NOS. 10737 UP
DELCO GENERATING, STARTING AND LIGHTING SYSTEM
DELCO IGNITION

- Battery.**—Battery is 6 volt, 80 ampere-hour. The negative (—) terminal is grounded.
- Ignition.**—Breaker contacts separate .018 inch. They are made of tungsten. They will operate properly even though very irregular, due to the fact that the rough surfaces fit each other perfectly. Their natural color is dark gray, not silver. Should they become badly burned or pitted, affecting the ignition, remove and resurface them by drawing across a piece of fine emery cloth laid on a flat surface, as on the bed of a drill press, finishing on a very hard oil stone. Clean all oil from contacts before again putting into service.
- Timing.**—Breaker contacts should separate when piston entering power stroke is on top dead center, spark control lever one third advanced. (First see that breaker assembly is fully retarded when control lever is in the fully retarded position.)
- Firing Order.**—The firing order is 1, 4, 2, 6, 3, 5.
- Spark Plug Gaps.**—Spark plug gaps should be .028 to .030 inch.
- Oiling.**—Distributor shaft bearings are of the oilless type. If track of rotor button inside distributor head is not well polished, apply a small amount of vaseline with a soft cloth.
- Starter.**—Starting motor is Model No. 100. It is connected to the engine through a Bendix drive. Running freely, starter should draw 40 amperes. It should deliver 16 pound-feet lock torque.
- Oiling.**—Starter bearings are of the oilless type and require absolutely no lubrication.
- Generator.**—Generator current regulation is by third brush method.
- | GENERATOR DATA, MODEL 123 | | | |
|---------------------------|----------|--------------|----------|
| Cold—Amperes | R. P. M. | Warm—Amperes | R. P. M. |
| Neutral..... | 500 | Neutral..... | 500 |
| 10.5-12.5..... | 900 | 10-12..... | 900 |
| 15.5-18..... | 1400 | 14-16..... | 1400 |
| 13.0-17..... | 2400 | 11-13..... | 2000 |
- To adjust the charging rate, loosen the two screws on the movable arm holding the third brush. If it is desired to increase the charging rate, the arm should be lengthened, and shortened to decrease it.
- Oiling.**—Put 4 or 5 drops of light engine oil in the oil cup on commutator end every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.
- Relay.**—There is no relay. The circuit between the generator and the battery is controlled by the ignition switch.
- Lamps.**—Head lamps are 6-8 volt, 20 cp. Dimmer lamps are 6-8 volt, 5 cp. Dash and tail lamps are 6-8 volt, 2 cp.
- Circuit Breaker.**—There is a vibrating circuit breaker in the lamp circuits to take the place of fuses. It requires a current of 25 amperes to start this device vibrating, but when vibrating a current of 3 to 5 amperes will cause it to continue.
- Model Numbers.**—Starter is No. 100. Generator is No. 123. Ignition coil is No. 2161. Combination switch is N. 1109. Starter switch is No. 1964.

Plate No. 348

KING

MODEL EE (1917-18) G (1918)

BIJUR GENERATING, STARTING AND LIGHTING SYSTEM ATWATER-KENT IGNITION

BATTERY.—Battery is 6 volt, 80 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Breaker contacts separate .005 to .008 inch. They are made of tungsten.

When the condition of the points affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING.—Put several drops of light engine oil in the oil hole, exposed when distributor cap is removed, every two weeks. Put a very small amount of vaseline on the cam, applying with a toothpick. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever $\frac{1}{2}$ inch from the fully retarded position.

FIRING ORDER.—The firing order is 1R, 4L, 3R, 2L, 4R, 1L, 2R, 3L.

SPARK PLUG GAPS.—Spark plug gaps are .025 inch.

STARTER:—Type ED-160, M 794, M 908 or M 909. Starter is connected to engine through a Bijur automatic pinion shift. Rotation is clockwise viewed from commutator end.

OILING.—Put several drops of light engine oil in each of starter bearing oilers every month.

GENERATOR:—Type L61, M-741 or M-1088. Anti-clockwise rotation, commutator end. Generator current regulation is by third brush system. Maximum generator output is 12-16 amperes, reached at 20-25 miles per hour, or 1400-1600 R.P.M. of armature. Output is varied by shifting third brush. Third brush is secured to generator by two stud bolts, the nuts of which appear in a recess in the front head of generator. Loosen these nuts with a socket wrench and shift the brush by gently tapping the shank of the wrench. Shifting brush in the direction of armature rotation will increase the output. Shifting brush in the opposite direction will decrease the output. Shifting the brush $\frac{1}{16}$ inch will vary the output 2 or 3 amperes. Tighten nuts after adjusting brush. Brush adjustment is made to give the desired rate with generator hot and charging a 3 cell battery, reading 1.250 or above. There is a 10 ampere fuse in the small aluminum cap on generator housing to protect generator windings, should excessively high resistance occur in the charging circuit.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.

RELAY.—Relay closes at 10-12 miles per hour or 500-600 R.P.M. of armature, and opens at 8-10 miles per hour, or 450-500 R.P.M. of armature. The charging current is 1 to 3 amperes at closing and the discharge current 0 to 1 ampere at opening of relay. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 18 cp. Dimmer lamps are 6-8 volt, 4 cp. Tonneau lamp is 6-8 volt, 4 cp. Inspection lamp is 6-8 volt, 4 cp. Dash lamp is 6-8 volt, 2 cp. Tail lamp is 6-8 volt, 2 cp.

FUSES.—Fuses are 10 amperes.

Westinghouse Ignition

Plate No. 349

DANIELS MODEL B 1916-17-18-19.

WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM WESTINGHOUSE IGNITION

BATTERY.—Willard, 6 volt, 100 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Breaker contacts separate .008 inch. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper. Adjust the distributor brush springs so that the brushes extend 1/4 inch from their holders when the distributor cap is removed, retaining them, however, so that they do not fall out. Brushes must move freely in their holders. See that the brushes on the top and bottom of the rotor are in place when installing the rotor.

OILING.—Put 2 or 3 drops of light engine oil in the oiler at the side of the ignition unit every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

TIMING.—Breaker contacts begin to separate when piston entering power stroke is on top dead center, spark control advanced one-tenth.

BALLAST RESISTOR.—There is a ballast resistor in the ignition switch. In case it is necessary to operate the car with the ballast defective, a 5 ampere fuse may be used temporarily, but the ballast must be replaced as soon as possible, as continued operation without it will result in serious burning of the timer contacts.

FIRING ORDER.—The firing order is 1R, 1L, 3R, 3L, 4R, 4L, 2R, 2L.

SPARK PLUG GAPS.—Spark plug gaps are .025 inch.

STARTER.—Frame 751. Starter is connected to the engine through a Bendix drive.

Torque	R.P.M.	Amperes
2.5 lb. ft.	1450	140
5.0 lb. ft.	1150	200
10.0 lb. ft.	900	270
15.0 lb. ft.	560	460
21.0 lb. ft.	Lock	650

Frame No. 750. (Used during 1916-17-18)

Torque	R.P.M.	Amperes
3.5 lb. ft.	1050	
17.5 lb. ft.	Lock	500

Oiling.—Put 5 or 6 drops of light engine oil in each of the starter oilers every month.

GENERATOR.—Frame 400-R. Generator voltage regulation is by vibrating regulator. Maximum charging rate is 15 amperes, decreasing to 4-6 amperes as battery becomes fully charged. Maximum current output is reached at 1400 R.P.M. of armature or 20 miles per hour. Charging rate is 12 amperes at 1200 R.P.M., with battery of 1250 solution.

Oiling.—Put 4 or 5 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY-REGULATOR.—Relay and regulator are combined into one unit. Relay closes at 550-600 R.P.M. of armature or 8-10 miles per hour, and opens at 500-550 R.P.M. of armature or 6-8 miles per hour. Charging current is .5 to 1 ampere at closing and the discharge current 1-3 amperes at opening of relay contacts. Relay is adjusted by bending the two brass prongs at the end of the moving member. To adjust regulator, connect a voltmeter between the "A" generator terminal and ground. Operate the generator at 1400 R.P.M., charging a battery of 1250 solution. Then adjust the regulator spring tension by means of the thumb screw, until the voltmeter indicates 6.8 volts and 15 amperes. To secure accurate setting connect a variable resistance in parallel with the battery. Air gap between the regulator armature (moving member) and coil core is .045 to .055 inch. Air gap between the relay armature and coil core is .055 to .060 inch. Center gap is .015 to .019 inch. Clean relay and regulator contacts by drawing unglazed paper between them. If badly burned or pitted resurface tungsten contacts on an oilstone, and the silver contacts with a scraper. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash, tail, clock and tonneau lamps are 6-8 volt, 2 cp. In 1916-17-18, head lamps were 6-8 volt, 18 cp. Dimmer lamps were 6-8 volt, 2 cp.

FUSES.—Fuses are 15 ampere.

Plate No. 350

EL CAR

MODELS D-4, E-4, G-4, D-6, E-6 AND G-6 (1919) DYNETO GENERATING, STARTING AND LIGHTING SYSTEM ATWATER-KENT IGNITION

BATTERY.—Battery is 6 volt, 85 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Type CC. Breaker contacts separate .006 inch. They are made of tungsten. When the condition of the points affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING.—Every two weeks remove the distributor cap and rotor and put 4 or 5 drops of light engine oil in the oil hole exposed. Put a small amount of vaseline on the cam, applying with a toothpick. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

TIMING.—Breaker contacts begin to separate when piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order of the 4 cylinder cars is 1, 3, 4, 2. The firing order of the 6 cylinder cars is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .025 inch.

STARTER.—Starter is connected to the engine through a Bendix drive.

OILING.—Put 4 or 5 drops of light engine oil in rear starter bearing oiler every month. Every three months remove the cap at front end and saturate the felt packing with light engine oil.

GENERATOR.—Generator current regulation is by third brush system. Maximum current output of 14 amperes is reached at 16-18 miles per hour or 1500 R.P.M. of armature.

Generator Data

Amperes	M.P.H.	Volts
0	7-9	6.4
5	9-10	6.6
10	12-14	6.8
12-14	16-18	7.8
8	40-45	6.7

Charging rate may be varied by adjusting third brush setting. To increase charging rate, remove the leather plug from commutator end-plate, loosen the set screw and move in a counter-clockwise direction (looking at commutator end). Move third brush in a clockwise direction to decrease charging rate. Shunt field current is 3.5 amperes at 6.5 volts.

OILING.—Put 4 or 5 drops of light engine oil in each of generator bearing oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 8-10 miles per hour, or 450-500 R.P.M. of armature, and opens at 6-8 miles per hour or 400-450 R.P.M. of armature. Relay contacts separate 3/32 inch. Air gap between relay armature (moving member) and coil core is 1/8 inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp.

FUSES.—Fuse is 15 ampere.

SERIES "F"
BJUR STARTING & LIGHTING
DELCO IGNITION

Plate No. 351

JORDAN
MODEL C (1918)
SERIES F (1919)
BJUR GENERATING, STARTING AND LIGHTING SYSTEM
DELCO IGNITION

BATTERY.—Willard, Type SJW-4, 6 volt, 118 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Breaker contacts separate .020 inch. They are made of tungsten. When the condition of the points affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING.—Put 4 or 5 drops of light engine oil in each of the ignition unit oilers every two weeks. If the track of the rotor button in the distributor head is not well polished, apply a small amount of vaseline with a soft cloth. If car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when the top dead center mark on the fly-wheel is one inch past the indicator, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .025 to .030 inch.

STARTER.—Type ED-160, M-979A. Rotation is counter-clockwise, looking at commutator end. Starter is connected to the engine through a Bendix drive. Lock torque is 16.5 pound-feet, current 665 amperes at 3.6 volts. Pressure of brushes on commutator is 25 ounces.

OILING.—Put 5 or 6 drops of light engine oil in each of starter oilers every month.

GENERATOR.—Type L-61, M-1090 or M-1195. Rotation is counter-clockwise, looking at commutator end. Generator current regulation is by third brush system. Maximum charging rate is 15 amperes, reached at 15 to 20 miles per hour. Charging rate reduces to 12 amperes at 30-40 miles per hour. Shunt field current is 6-8 amperes at 7.8 volts. Pressure of brushes on commutator is 14 ounces. Charging rate is varied by inserting a special toothed wrench in the adjusting hole in the commutator end plate and moving the third brush assembly. Turn the wrench in a clockwise direction to increase the charging rate, and in a counter-clockwise direction to decrease the charging rate.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted in generator frame. Relay closes at 8-9 miles per hour or 550-600 R.P.M. of the armature, and opens at 6-7 miles per hour or 500-550 R.P.M. of the armature. Relay contacts separate .045 inch. Air gap between the relay armature and coil core is .035 inch, contacts closed. To adjust relay, connect a voltmeter across the main brushes of the generator, and slowly speed up the engine. Insert the special socket wrench in the small adjusting hole in the commutator end plate and vary the spring tension on the relay armature until the contacts close when the voltmeter indicates 6.5 volts. Closing of relay will be indicated by the ammeter showing "Charge". Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 18 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are each 6-8 volt, 3 cp.

MOLINE-KNIGHT

MODEL G (1919)

WAGNER GENERATOR. AUTO-LITE STARTER
CONNECTICUT IGNITION

Plate No. 352

BATTERY.—Willard, Type SJW-4, 6 volt, 120 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Breaker contacts separate .025 inch. They are made of tungsten. When the condition of the contacts affects the ignition, renew the inner breaker mechanism. For temporary service, resurface the contacts with fine emery cloth

OILING.—Refill the cup under the breaker head with pure vaseline and turn down every month. If car is driven more than 1000 miles in a month, this must be done every 1000 miles. Do not put grease or oil in the cup.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 3, 4, 2.

SPARK PLUG GAPS.—Spark plug gaps are .027 inch.

STARTER.—Auto-Lite, Type MC. Starter is connected to the engine through a Bendix drive.

Starter Data		
Torque	R. P. M.	Amperes
1 lb. ft.	2650	100
4 lb. ft.	1400	225
6 lb. ft.	1000	300
16 lb. ft.	Lock	450

OILING.—Clean out starter bearings and repack with soft cup grease every six months. Add 2 or 3 drops of light engine oil to keep the grease soft, every month.

GENERATOR.—Wagner, E.M.-202, Type 45-W. Rotation is counter-clockwise, looking at commutator end. Generator current regulation is by third brush system. Maximum current output is 17 amperes, reached at 20 miles per hour.

Amperes	Generator Data	R.P.M.
7.0		700
13.0		1000
16.0		1300
17.0		1500
14.0		2000
10.5		2500

To increase the charging rate, move the third brush in a counter-clockwise direction (looking at the commutator end). Move the third brush in a clockwise direction to decrease the charging rate.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 8-10 and opens at 6-8 miles per hour. Charging current at closing is 2 amperes, and the discharge current is 0-4 amperes at opening of relay contacts. Relay contacts separate .035 to .065 inch. Air gap between relay armature and coil core is .025 inch, contacts closed. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 15 cp. Dash and tail lamps are 6-8 volt, 2 cp.

BOUR-DAVIS

1919

REMY GENERATING, STARTING AND LIGHTING SYSTEM REMY IGNITION

BATTERY—Willard, Type SJW-4, 6 volt, 100 ampere-hour. The positive (+) terminal is grounded.

IGNITION—Breaker contacts separate .020 inch. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING—Refill the cup under the distributor head with soft cup grease and turn down two turns every two weeks. Put a small amount of vaseline on the fiber bumper of the contact arm, applying with a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS—Spark plug gaps are .025 inch.

STARTER—Model No. 303A. Starter is connected to the engine through a Bendix drive.

Starter Data

Torque	R.P.M.	Amperes	Volts
1 lb. ft. ---	1850 ---	110-115 ---	5.3-5.5
2 lb. ft. ---	1400 ---	158-165 ---	5.1-5.3
3 lb. ft. ---	1150 ---	200-210 ---	4.9-5.1
4 lb. ft. ---	850 ---	238-250 ---	4.6-4.8
5 lb. ft. ---	700 ---	275-285 ---	4.4-4.6
15 lb. ft. ---	Lock	550-575 ---	3.3-3.4

OILING—Put 5 or 6 drops of light engine oil in each of the starter oilers every month.

GENERATOR—Model No. 230-C. Generator current regulation is by third brush system. A thermostat, located in the brush rigging of the generator, cuts a resistance into the shunt field circuit at a temperature of 175°F., reducing the maximum charging rate 6 amperes. The thermostat is intended to regulate the charging rate as demand of seasons or car operation requires. Never touch the thermostat points.

Generator Data

Amperes	R.P.M.	Volts
0 ---	515 ---	6.4
7 ---	745 ---	7.1
14 ---	1000 ---	7.9
22 ---	1800 ---	8.6
17 ---	2500 ---	8.2
12 ---	3000 ---	7.8

Above tests are made with relay in circuit and thermostat points closed, but without ignition. Shunt field current is 5 amperes at 6.4 volts. Brush pressure of main brushes is 17 to 20 ounces. Pressure of third brush is 13 to 17 ounces. Maximum charging rate is reached at 30 miles per hour.

OILING—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY—Relay closes at 500-550 R.P.M. of the armature or 8-10 miles per hour, and opens at 450-500 R.P.M. of the armature or 6-8 miles per hour. Relay contacts separate .012 to .015 inch. Air gap between relay armature and coil core is .012 to .015 inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS—Head lamps are 6-8 volt, 15 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp.

FUSES—Fuses are 10 ampere.

Plate No. 353

Plate No. 354

DAVIS
MODELS 6H, 6I, 6J AND 6K (1919)
DELCO GENERATING, STARTING AND LIGHTING SYSTEM
DELCO IGNITION

BATTERY.—Battery is 6 volt, 100 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Breaker contacts separate .018 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING.—Distributor bearings are of the oilless type. If the track of the rotor button in the distributor head is not well polished apply a small amount of vaseline with a soft cloth.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control one-third advanced.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .030 inch.

STARTER.—Model No. 106. Starter is connected to the engine through a Bendix drive. Lock torque is 16 pound-feet. Running freely, starter takes 40 amperes.

OILING.—Starter bearings are of the oilless type.

GENERATOR.—Model No. 105. Generator current regulation is by the third brush system. Generator begins to supply current at 500 R.P.M. of the armature or 7-8 miles per hour, and reaches its maximum current output at 1400 R.P.M. of armature or 18-25 miles per hour.

Generator Data			
Cold Test		Hot Test	
Neutral	500	Neutral	500
10.5-12.5	900	10-12	900
15.5-18.0	1400	14-16	1400
13.0-17.0	2000	11-13	2000

To vary charging rate loosen the two screws which hold the third brush arm. Move the third brush to the right (facing commutator end) to increase the charging rate. Tighten the two screws and reseal the brush after adjusting position. Maximum current output must not exceed 20 amperes.

OILING.—Put 4 or 5 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—There is no relay. The circuit between the generator and the battery is controlled by the ignition switch.

LAMPS.—The head lamps are 6-8 volt, 15 cp. Dash and tail lamps are 6-8 volt, 4 cp.

CIRCUIT-BREAKER.—A vibrating circuit-breaker takes the place of fuses. It requires a current of 25 amperes to start this device vibrating. While vibrating, the current is 3-5 amperes.

NEW SERIES (1919) (SERIAL NOS. 65001 UP)

WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM

BOSCH MAGNETO IGNITION

BATTERY.—Battery is 6 volt, 100 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Type DU6. Breaker contacts separate .014 to .016 inch. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Put 2 or 3 drops of light engine oil in each of the magneto oilers every month. Apply a small amount of vaseline to the fiber bumper of the contact arm, with a toothpick. If the car is driven more than 1000 miles in a month, these attentions must be given every 1000 miles.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .025 to .028 inch.

STARTER.—Frame 710. Starter is connected to the engine through a Bendix drive.

Starter Data		
Torque	R.P.M.	Amperes
0 lb. ft.	4000	40
4 lb. ft.	1400	120
8 lb. ft.	700	280
14 lb. ft.	Lock	450

OILING.—Put 5 or 6 drops of light engine oil in each of the starter oilers every month.

GENERATOR.—Frame 760. Generator current regulation is by the third brush system. Maximum current output is 13-15 amperes, reached at 1100-1500 R.P.M. of the armature, or 15 to 20 miles per hour.

Generator Data					
Amperes	Cold Test	R.P.M.	Amperes	Hot Test	R.P.M.
0		500	10.5-12.5		1250
8		825	10		2500
12		840			
13-15		1100-1500			
7-10		2500			

The cold test readings are obtained with a generator temperature under 95°F. The hot test readings are obtained after the generator has been operated one hour at 1800 R.P.M., charging a half-charged battery. The shunt field current is 2.8 to 3.25 amperes when 6-6.3 volts pressure is applied. When the generator is operating freely as a motor, the current is 3.5 to 5 amperes at 6-6.3 volts. Move the third brush in the direction of armature rotation to increase the charging rate, or in the opposite direction to decrease the charging rate.

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted in the generator frame. Relay closes at 500-550 R.P.M. of the armature or 6.2 to 6.5 volts or 8-9 miles per hour, and opens at 450-500 R.P.M. of the armature or 7-8 miles per hour. Charging current is 1-2 amperes at closing, and the discharge current 0 to 3 amperes at the opening of relay contacts. Air gap between relay armature (moving member) and coil core is .030 to .035 inch, contacts separated. Contacts separate .013 to .018 inch. Clean contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 18 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp.

FUSES.—Lighting circuit fuses are 20 ampere. Generator field fuse is 5 ampere.

STEARNS-KNIGHT

MODEL SKL4 (1919)

REMY GENERATING, STARTING AND LIGHTING SYSTEM

REMY IGNITION

BATTERY.—Willard, 12 volt, 65 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Breaker contacts separate .020 to .022 inch. When the condition of the points affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper. Ignition current is 3.5 amperes, engine idle, breaker contacts and ignition switch closed.

OILING.—Refill the cup under the distributor head with soft cup grease and turn down two turns every two weeks. Put a small amount of vaseline on the fiber bumper of the contact arm, using a toothpick. If the car is driven more than 500 miles in two weeks, these attentions should be given every 500 miles.

TIMING.—Breaker contacts begin to separate when the top dead center mark on the fly-wheel is 1 1/4 inches past the indicator, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 3, 4, 2.

SPARK PLUG GAPS.—Spark plug gaps are .025 inch.

STARTER.—Model No. 309-A. Starter is connected to the engine through a Bendix drive. Starter cranks the engine at 250 R.P.M., current 345 amperes at 8.5 volts. Operating freely armature revolves at 2900 R.P.M., current 70 amperes. Lock torque is 42 pound-feet, current 540 amperes at 6 volts. Tension of brushes on commutator is 20-24 ounces.

Starter Data

Test made with 6 volt battery

Torque	R.P.M.	Amperes	Volts
2 lb. ft.	1050	72-82	5.60-5.75
4 lb. ft.	750	115-119	5.55-5.65
6 lb. ft.	575	143-150	5.35-5.45
8 lb. ft.	470	172-179	5.15-5.25
10 lb. ft.	365	198-205	5.05-5.15
12 lb. ft.	300	220-230	4.94-5.05
20 lb. ft.	Lock	375-400	3.80-4.20

OILING.—Put 4 or 5 drops of light engine oil in each of starter bearing oilers every month.

GENERATOR.—Model 238-A. Generator current regulation is by multiblade thermostat.

Generator Data

(Operating as a straight shunt generator, without regulator)

Amperes	R.P.M.	Volts
0	440	12.8
7	550	14.0
14	670	15.1
18	765	15.7

Generator brushes are set 1/2 to 2/3 of a commutator bar from the neutral position in the direction of rotation. Maximum charging rate is reached at 20 miles per hour.

OILING.—Put 4 or 5 drops of light engine oil in each of generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 440-500 R.P.M. of armature or 9-10 miles per hour, and opens at 400-440 R.P.M. of armature, or 7-8 miles per hour. Relay contacts separate .020 inch. Air gap between relay armature (moving member) and coil core is .020 inch, contacts closed. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

REGULATOR TEST.—Operate generator with 25 ampere output, 16-17 volts. Current should decrease to 15 amperes in 3 minutes. Speed generator up to 1600 R.P.M. for 5 minutes. Current should decrease to 8-12 amperes at the end of the run.

CARE OF REGULATOR.—Inspect the four sets of contact points of the multiple-thermostat every month. Clean contacts by drawing thin, worn No. 00 sandpaper between them. The contacts must not be separated more than is necessary to insert the sandpaper. Remove all grit by drawing thin, unglazed paper between them.

LAMPS.—Head lamps are 12-16 volt, 15-24 cp. Dimmer lamps are 12-16 volt, 4 cp. Dash and tail lamps are 12-16 volt, 2 cp.

FUSES.—Fuses are 10 ampere.

Plate No. 357

MARMON MODEL 34 (1918-19)

BIJUR GENERATING, STARTING AND LIGHTING SYSTEM BOSCH IGNITION

BATTERY.—Battery is 6 volt, 120 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Breaker contacts separate .014 to .016 inch. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Put 3 or 4 drops of light engine oil in each of the magneto oilers every two weeks. Put a small amount of vaseline on the fiber bumper of the contact arm, applying with a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when the top dead center mark on the fly-wheel is one inch before the indicator, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .032 inch.

STARTER.—Type AD-200, M-923. Rotation is counter-clockwise, looking at the commutator end. Starter is connected to the engine through a Bijur automatic pinion shift.

OILING.—Put 5 or 6 drops of light engine oil in each of the starter oilers every month.

GENERATOR.—Type K-643, M-792. Rotation is counter-clockwise, looking at the commutator end. Generator voltage regulation is by vibrator regulator. Maximum current output is 15 to 18 amperes, decreasing to 4-6 amperes as battery becomes fully charged. Maximum charging rate is reached at 1000-1400 R.P.M. of the armature or 12-15 miles per hour. Lights may be operated direct from the generator, battery disconnected. It does not matter which battery terminal is connected to the generator, as the latter will automatically assume the right polarity to charge the battery.

OILING.—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY-REGULATOR.—Relay and regulator are contained in an aluminum case, mounted on generator frame. Adjustments are made through two holes in the side of the case. These holes are covered with lead seals, to prevent incompetent parties tampering with the adjustment. Internal circuits and instructions for the adjustment of the relay-regulator are given on Page 500.

LAMPS.—Head lamps are 6-8 volt, 30 cp. Dimmer lamps are 6-8 volt, 8 cp. Tail, cow, tonneau and trouble lamps are 6-8 volt, 4 cp.

FUSES.—Fuses are 20 ampere.

Continued on Next Page

MARMON

MODEL 34 (1918-19)

BIJUR GENERATING, STARTING AND LIGHTING SYSTEM BOSCH IGNITION

Continued from preceding page.

RELAY-REGULATOR.—The internal circuits of the Bijur relay-regulator are shown in Plate 500. The ground connection for this type of generator (employing the grounded return or single wire system), is made through the regulator box disconnecting plug by means of a fillister head screw, which locks the plug into place in the plug receptacle. Special instructions for the adjustment of the relay-regulator are necessary, as the usual procedure where the two-wire system is used is not applicable to this type. If the relay contacts do not close when the voltage of the generator reaches 6.5 volts, as indicated by a voltmeter connected across the main brushes of the generator, the relay requires adjustment. Remove the disconnecting plug (plug to which the line wire is attached). Insert the adjusting wrench in the hole in the relay regulator case nearest the plug end and make a trial adjustment of the spring tension. Turn the wrench to the right to raise the cut-in voltage, and to the left to decrease the cut-in voltage. Replace the disconnecting plug and ascertain the result of the adjustment. Continue making trial adjustments in this manner until the desired relay action is obtained. Be sure that the disconnecting plug is always removed before the wrench is inserted in the adjusting holes, or a direct short-circuit of the battery is liable to occur. Adjust the regulator in the same manner, making trial adjustments with the disconnecting plug removed, until the specified action is obtained. To adjust the regulator the generator must be driven at 1000-1400 R.P.M., charging a battery of 1.250 solution or higher. The regulator should be adjusted to limit the voltage of the generator to 7.75 volts. This voltage must be maintained at all higher speeds. Turn the adjusting nut to the right to raise the voltage and to the left to lower the voltage.

STARTER

GENERATOR CONNECTIONS TO RELAY-REGULATOR

Starter and Generator Internals

WIRING DIAGRAM FOR DEMOUNTABLE TYPE VOLTAGE REGULATOR.

Plate No. 358
Relay-Regulator Circuits

Types CC and CA

Types.—Types CC and CA Atwater-Kent systems are of the closed circuit type. Type CC is for manual advance. CA is for automatic advance.

Contacts.—Contacts should separate .005 inch to .008 inch. They are made of tungsten and will operate properly even though quite rough. Their natural color is dark gray, not silver. If badly burned or corroded, affecting the ignition, remove and clean by drawing across a piece of very fine emery cloth, laid on a flat surface, as on the bed of a drill press, resurfacing on a very hard oil stone. It must be remembered that even though very rough, tungsten contacts will operate properly, owing to the fact that the rough surfaces fit into each other perfectly.

Timing.—Type CC.—Turn engine until the piston entering power stroke is on top dead center. Place spark control lever one inch from the fully retarded position or as directed on other pages of this Manual (see page applying to car in question.) Then loosen control rod at breaker and turn breaker assembly back until contacts begin to separate and again connect control lever to advance lug on breaker assembly. Moving the spark control lever from the fully retarded to the fully advanced position should move the advance coupling lug on breaker assembly $\frac{7}{8}$ of an inch to 1 inch.

Type CA.—Turn engine until piston entering power stroke is on top dead center. If spark control lever is provided, place 1 inch from the fully retarded position, or as directed on another page of this Manual (see page applying to car in question) and loosen control rod at breaker assembly advance lug. If no control lever is provided, loosen the locking device so that breaker assembly may be rotated. Then turn assembly back until contacts begin to separate. Then fasten the locking device to prevent breaker assembly turning or connecting the control rod to lug as the case may be. Moving of control lever from the fully retarded to the fully advanced position should move the advance lug $\frac{5}{8}$ of an inch to $\frac{3}{4}$ of an inch, when automatic advance is used also.

Condenser, Replacing of.—To replace condenser, referring to Fig. 3, first put insulated washer (1) in place, next place condenser (2) in pocket, lay insulating washer (3) on top of condenser terminal (A) place condenser cover (4) in position, and put insulated screws (5 and 6) in. Then adjust contacts.

Oiling.—Put several drops of light engine oil in the oil hole, exposed when distributor cap is removed, every two weeks. At the same time put a very small amount of vaseline on the cam, applying with a toothpick. If car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

FIG. 1
Parts List—Type "CC"

Parts of Governor Assembly not furnished separately
Parts List—Type "CA"

When any part of governor assembly is required, the repair station or factory will furnish complete governor assembly and housing. On receipt of new assembly return old assembly to nearest repair station or factory and you will receive credit for whatever parts can be used again.

In ordering new shafts or assemblies when old ones are not returned, specify make, model and year of car.

When ordering parts, order by name given here, specifying Type CC or Type CA, as required, and number of cylinders.

Plate No. 359

FIG. 3
Sequence of Operations in Installing Condenser

FIG. 4
Internal Circuits of Type CC and CA
Atwater Kent System

Atwater Kent Ignition

Types H, K2, K3

Types.—Type H is for manual advance. Type K2 is for automatic advance. Type K3 is for combined manual and automatic advance.

Operation.—Referring to Figs. 1, 2, 3 and 4, the notched shaft has one notch for each cylinder, the one shown being for a four cylinder engine. As the shaft rotates the hook on the end or the lifter catches in the notch as shown in Fig. 1, pulling the lifter up until the points marked "X," Fig. 2 come together. This causes the catch to be forced out, releasing it. When latch is released, the spring pulls it back. As it is pulled back, it strikes the catch and closes the contacts as shown in Fig. 3. As it moves farther, the latch is released and allows the contacts to be separated as shown in Fig. 4 and the above operation is repeated. As the action is so rapid as to be almost imperceptible to the eye, many people suspect the contacts of not making connection. To test this, hold the lifter from springing back when it is released by the shaft, and allow it to come back slowly. The contacts will then be seen to close if adjusted properly. Do not test contacts with a screw driver or other piece of metal. To do so may heat and take the temper out of the spring.

Contacts.—Contacts should separate .010 inch to .012 inch. They are made of tungsten and will operate properly even though rough, due to the fact that the surfaces fit each perfectly. Their natural color is dark grey, not silver. If burned or corroded, affecting the ignition, remove them and clean by drawing across a piece of fine emery cloth, laid on a flat surface, as on the bed of a drill press, finishing on a very hard oil stone.

Timing.—To time breaker to engine, turn engine until piston entering power stroke is on top dead center, spark control lever one inch from the fully retarded position or as directed on another page of this Manual. (See page applying to car in question.) Then loosen control rod at advancing control lug on breaker assembly on cars using manual control, or loosen locking device, so that assembly may be turned, on cars having automatic control only. Then turn assembly back slowly until a click is heard. Stop immediately, connect control rod or secure locking device, to hold breaker in this position.

Spark Plug Gaps.—Spark plug gaps should be .025 inch to .031 inch, depending on the engine upon which it is used.

Oiling.—Put a drop of light machine oil in each of the 3 points marked in Fig. 5 and put 4 or 5 drops of light machine oil in the oil hole beside the notched shaft, every two weeks. Put a very small amount of vaseline on the notched shaft, applying with a toothpick, at the same time. If car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

NOTE:—If in need of notched shaft or any parts for governor assembly, order complete governor from nearest jobber or from factory direct, and on receipt of new governor return old governor to factory for inspection, and you will receive credit for parts that can be used again.

If you are in need of the latch or any of the pins for the contact maker plate, order the plate with these parts attached, and on receipt of new plate return old one to factory, and they will give you credit for parts that can be used again.

SERVICE ENGINEERING COMPANY, SAN FRANCISCO
—COPYRIGHTED, 1926

BIJUR AUTOMATIC PINION SHIFT

DIRECT ACTING TYPE

Plate No. 361
Direct Acting Type

Positive Geared Type

OPERATION.—The pinion (1) is driven by notches in the barrel (2), but is free to move along the shaft (3). When the starting switch is closed, the turning of the motor shaft (3) causes the nut (5) to screw itself to the left. The nut (5) drives the barrel (2) and pinion (1) through the clutch (6). The clutch member (6) is pressed against the face of the nut (5) by the spring (7). As the entire assembly moves along the shaft toward the left, the pinion will mesh with the flywheel gear if the teeth are in proper position. Should the teeth strike, the nut (5) continues to move along the shaft, compressing the spring (7), which in turn increases the friction of the clutch (6). This causes the pinion to be turned, allowing the compressed spring (7) to snap the pinion into mesh with the flywheel gear. As the nut moves further along the shaft, the clutch plate comes in contact with the washer (8). As the nut tends to move further, and the clutch plate can move no further, the friction of the clutch increases greatly, causing the pinion to be turned, cranking the engine. The slipping of the clutch and the compressing of the disked washers relieve the shocks of starting. As the engine picks up, the overrunning effect reverses the above operations and throws the pinion out of mesh. The spring (10) receives the shock when the gears are thrown out.

ADJUSTMENT AND CARE.—The clearance between the pinion and the flywheel gears, when in the fully demeshed position, must always be $\frac{3}{8}$ inch. To test shift, run the barrel along the shaft by hand to see that it turns freely. Sufficient lubrication (oil or graphite) must always be on the shaft (4) between washers 8 and 13 and between washers 14 and 15. To determine the initial torque of the clutch, fit a brake over the pinion (1) with a lever 1 foot long. Hold the armature shaft from turning with a wrench applied on the hexagon nut at commutator end. Attach a spring scale to the free end of the lever and determine the pull necessary to cause the clutch to slip. The pull required must be not less than $4\frac{1}{2}$ to 5 pounds and not more than 12-15 pounds.

POSITIVE GEARED TYPE

OPERATION.—The teeth in the motor armature shaft (X) are permanently meshed with the gear (D), which drives the shaft (B) through the clutch assembly (E, F, I, G, H). When shaft (B) turns, the pinion (M) screws itself to the left, meshing with the flywheel gear (Y). The pinion comes in contact with the sleeve (H) and forces the clutch assembly and drive gear (D) to the left, compressing spring (L). As spring becomes compressed, the pressure exerted between the face of the drive gear (D) and the clutch member (E) is sufficient to transmit to the drive shaft the power necessary for cranking the engine. When the engine begins to run under its own power, the pinion (M) is driven faster by the flywheel than the shaft (B) is driven by the starter, hence the pinion screws itself to the right, out of mesh with the flywheel gear. The demeshing movement of the pinion is cushioned by the spring (O). Should the pinion fail to mesh with the flywheel gear due to the ends of the teeth striking, the pinion will cease to turn. The shaft (B) and assembly then screws itself to the right until the sleeve (H) comes into contact with the pinion, causing the pinion to turn. When the pinion then meshes with the flywheel gear, the spring (O) causes the shaft (B) and assembly to return to normal position.

ADJUSTMENT AND CARE.—The drive shaft (B) must be free to slide $\frac{5}{8}$ inch endwise. The driven clutch plate (F) must be free to slide on the shaft (B). To determine the initial torque of the clutch, due to the tension of the spring (L), clamp the shaft (B) firmly in a vise, and fasten a brake having a lever arm one foot long to the gear (D). Attach a spring balance to the free end of the lever arm and determine the pull necessary to cause the clutch to slip. This pull must not be less than 4 pounds or more than 12 pounds. The spring (L) has a free length of $2\frac{1}{8}$ to $2\frac{1}{4}$ inches. If the clutch slips, due to surface of gear (D) becoming polished, the gear should be put in a lathe and a fine cut taken off its face to roughen it. If pinion (M) sticks on the shaft, clean both pinion and shaft thoroughly with gasoline.

LARGE 1914 SINGLE COIL GENERATING, STARTING AND LIGHTING SYSTEM

This system is used on the following cars:

1914 Buick, Model B55	1914 Oakland, Model 43
1914 Cole, Series 9	1914 Oakland Model 6-48
1915 Cole, Series 10	1914 Oakland, Model 6-60
1914 Moon, Model 42	1914 Oldsmobile, Model 54
1914 Moon, Model 6-50	1915 Oldsmobile, Model 55

BATTERY.—Battery is 6 volt, 80-120 ampere-hour. The negative (—) terminal is grounded.

STARTER.—Starter and generator are combined into one unit, but are electrically separate. Starter is connected to engine through a set of reduction gears meshed by the operator. Pressing the "Start" button brings ignition relay into action and connects terminals 8 and 9 on the combination ignition and lighting switch, completing circuit around relay. This applies battery pressure to generator windings, causing armature to revolve slowly, aiding meshing of the gears. Depressing the starting pedal then meshes the gears, opens the generator circuit and completes motor circuit, causing it to crank the engine. Two overrunning clutches are provided. Clutch at driving end permits rotation of armature necessary during cranking operation. The second overrunning clutch prevents engine driving starter through the reduction gears.

GENERATOR.—Generator voltage regulation is by mercury tube type regulator. Generator is shunt wound, in which type of machine the voltage, hence ampere output increases rapidly as speed increases, unless controlled by some means. The voltage erator is shunt wound, in which type of machine the voltage, hence ampere output, reducing its strength and controlling voltage. The regulator (See Plate 65A-3) consists of a tube made of German silver, lined with insulating varnish. Inside the large tube is a smaller bakelite tube. Both tubes contain a pool of mercury at the bottom. Mercury is to make a flexible connection between the moving and stationary elements of the regulator. The resistance coil and the contact rod (D), dip into the mercury pools. The height of the coil, hence the amount of the wire above the mercury, is regulated by the electro magnet, A. The plunger G is surrounded and actuated by the Coil A. This coil is connected across the generator terminals. The greater the current through it, the higher the plunger C and resistance coil will be lifted. Raising the coil adds additional resistance to the shunt field, thus reducing the voltage of the generator. The regulator is so proportioned that the voltage is held practically constant after the desired maximum is reached.

Fig. 3

Plate No.
Connections After Motor-Generator Has Been Rebuilt

DELCO

LARGE 1914 SINGLE COIL GENERATING, STARTING AND LIGHTING SYSTEM

Continued from preceding page.

TROUBLE SHOOTING.—If generator is operated at high speeds with excessive resistance in charging circuit, the work the regulator is made to do may be too great for it. In this case, voltage will rise to excessive values, sometimes burning out regulator coil, resistance, relay or generator field. Should generator fail to produce an electrical pressure, test regulator for open circuit by temporarily bridging across the fiber gasket at bottom, with a piece of metal. If generator then acts properly, mercury tube is at fault. To test shunt field for open circuit, press the "Start" button on lighting ignition switch. If armature attempts to revolve in a counter-clockwise direction, viewed from front end, shunt field circuit is open. There is a temperature regulator at bottom of mercury tube. Turn the regulator in a clockwise direction when viewed from the top, to increase the voltage.

OILING.—Put 4 or 5 drops of light engine oil in each of starter-generator bearing oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles. Refill grease cup at end of idler gear shaft with soft cup grease and turn down every month.

RELAY.—Relay closes at 7-10 miles per hour or 350-450 R.P.M. of armature, and opens at 5-7 miles per hour, or 300-350 R.P.M. of armature. Charging current is 1-3 amperes at closing and the discharge current is 0-2 amperes at opening of relay. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

Fig. 2

Delco

Small 1914 Single-Coil Generating, Starting and Lighting System

This system is used on the following cars:

1914 Buick, Models B-24-25,	1914 Oakland, Model 36
B-36-37	1914 Oldsmobile,
1914 Carter Car, Model 7	Model 42
1914 Hudson, Model 6-40	1914 Paterson, Models 32-33
1914 Keeton, Model 4-35	1914 Westcott, Model O-A

Battery.—Battery is 6 volt, 80-120 ampere-hour. The negative (—) terminal is grounded

Starter.—Starter and generator are combined into one unit, but are electrically separate. Starter is connected to engine through a set of reduction gears meshed by the operator. Two overrunning clutches are provided. Raising and lowering of one motor brush serves as a starting switch. A catch on the brush lifting-rod mechanically closes the cutout relay, allowing current to flow through generator windings, causing armature to revolve slowly, aiding meshing of gears. After gears are meshed, one generator brush is raised and motor brush is allowed to come in contact with commutator, completing the starter circuit and cranking the engine. When the pedal is released, a spring reverses above operations. One clutch permits motoring of generator and also the relatively high speed of armature necessary when operating as a starter. The other clutch prevents engine driving armature through the reduction gears.

Generator.—Generator current regulation is by reverse series field. Maximum current may be anywhere between 14 and 20 amperes, depending on the make of the car. For more definite current values, see page applying to car in question.

Oiling.—Put 4 or 5 drops of light engine oil in rear bearing oiler and in the front bearing oiler, exposed when front cover is removed, every two weeks. Keep a reasonable amount of soft cup grease in front clutch and gear compartment, at all times. Do not pack with an excessive amount, as this causes it to be forced through the front bearing, and onto the commutator and brushes. Refill grease cup at end of starter gear shaft and turn down every month. Once a year thoroughly clean out and repack both driving clutches with soft cup grease.

Fig. 3
Technical wiring diagram.

Plate No. 365

Delco

SMALL 1914 SINGLE COIL GENERATING, STARTING AND LIGHTING SYSTEM

Continued from preceding page.

RELAY.—Relay closes at 7-7½ volts. Charging current is 1 to 3 amperes at closing and the discharge current 0-1 ampere at opening of relay. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

CONNECTING AMMETERS.—To install an ammeter in this system, it will be necessary to cut or remove the strap connecting terminals 1 and 2 (see below). On some machines this strap is outside, as shown at A, and on others on the inside, as shown at B. On machines having strap on the outside, strap may be cut with a hacksaw and ammeter installed without removing machine from car. If strap is on the inside, it is necessary to remove and disassemble machine to remove the strap. After strap is removed, a wire is run from No. 2 terminal to positive (+) side of ammeter, and from the No. 1 terminal to the negative (—) terminal of ammeter.

Fig. 3.

DELCO IGNITION RELAY

The ignition relay is in the dry cell circuit. It acts as a vibrator interrupting the current and sends a shower of sparks across the gap when the breaker contacts of magneto or distributor are open.

This relay consists of a set of contacts operated by an electro-magnet having two windings: One of coarse wire, in series with the contacts and a holding coil of very fine wire to hold the contacts open after circuit in large winding is broken.

The operation of this relay varies with the external connections. If connected as shown in Fig. 1, a series of sparks will be thrown across the gap as long as the circuit between Nos. 6 and 7 terminals (holding coil) is held open, by holding down button on switch, timing contacts being closed. If the button is released, completing holding coil circuit, a single spark just as a magneto or breaker system gives, is obtained.

Fig. 2 shows the method of connecting the ignition relay to the 1914 Delco Junior system. The ignition switch completes the primary circuit and holding coil circuit is completed by timer contacts. In this way a vibrating spark will be obtained all the time the timer contacts are open. This provides a late spark.

The following points should be borne in mind while adjusting the relay:—When armature is pressed down to open contacts "C" there should be absolutely no motion of the lower spring "G". Contacts open .005 inch.

Increasing the air gap between armature and core of upper coil decreases the tension of the spring A on contacts. If it is impossible to get a strong enough spark by adjusting the air gap slightly, it may be necessary to increase the tension of the spring. This may be done by holding the spring loosely in a pair of duck-bill pliers, pressing down slightly and at the same time twisting to the right as shown in Fig. 3. When properly adjusted it should have a bowlike shape, Fig. 4, free from the waves shown in Fig. 3. Care should also be taken to see that the armature makes a right angle (90°) and that it is free to move on its pin.

When properly adjusted the ignition relay should take .6 ampere when furnishing a vibrating spark, with motor at rest.

Diagram showing how springs should look when properly "crowned"

BERLING MAGNETO

TWO SPARK DUAL, TYPES DD-44, DD-66 AND DD-88

BREAKER.—Breaker contacts separate .016 to .020 inch. They are made of platinum. When the condition of the points affects the ignition, resurface with a fine flat jeweler's file or worn No. 00 sandpaper. See that the brush in the back of the breaker base makes good contact with the surface on which it rubs.

OILING.—Put 10 drops of light engine oil in each oil cup every month. Put a small amount of vaseline on the cams and on the two rubbing surfaces of the fiber lever, applying with a toothpick. If the car is driven more than 1000 miles in a month, these attentions must be given every 1000 miles.

TIMING.—Turn the crankshaft until the piston in No. 1 cylinder is in the position where the fully retarded spark is desired to occur. Then remove the distributor block and turn the armature shaft until the distributor brush is in such a position that it will make contact with No. 1 segment when the block is replaced. Place the breaker housing in the fully retarded position by turning it as far as it will go against the direction of rotation of the armature. Then turn the shaft very slightly in either direction until the magneto breaker contacts just begin to separate. Couple the magneto to the engine, being careful to maintain the exact position of the armature. The battery breaker contacts separate 10 degrees later than the magneto breaker contacts.

SPARK PLUG GAPS.—Spark plug gaps are .020 to .030 inch.

COIL.—Type VN. The coil is of the vibrator type, giving a shower of sparks during the interval that the battery breaker contacts are separated.

SWITCH.—Type SW. The connections in the switch for the three positions of the switch handle are as follows:

"Off" Position.—"MP" connected to "G". "B" open. "D" connected to "MS".

"Batt" Position.—"B" connected to "G". "CS" connected to "D". "MS" connected to "MP".

"Mag" Position.—"MP" open. "B" open. "CS" open. "MS" connected to "D". "G" open.

COMBINED COIL AND SWITCH.—Type SC. The connections in the switch for the three positions of the switch handle are as follows:

"Off" Position.—"MP" connected to "GR". "B" open. "D" connected to "MS".

"Batt" position.—"MP" connected to "GR". Primary winding of coil connected between "B" and "T". Secondary winding of coil connected between "D" and "GR".

"Mag" Position.—"MP" open. "B" open. "D" connected to "MS".

Fig. 2

Plate No. 369

BOSCH TWO INDEPENDENT IGNITION SYSTEM

OPERATION.—By the use of this system the engine may be operated on either the magneto, battery, or both magneto and battery. Two sets of spark plugs must be used. Any independent single spark magneto may be used. The battery system consists of a breaker, distributor, and combined coil and switch. The battery system is entirely independent of the magneto.

CONSTRUCTION.—The construction, dimensions, and internal electrical connections of the coil are depicted in Figure 1, Plate 181. Construction of the breaker and distributor mechanism is shown in Figure 2. The breaker unit is driven at cam-shaft speed, and is fastened to the driving member by means of the sleeve "1" and the taper pin "2".

BREAKER.—The battery breaker contacts separate .018 to .020 inch. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Put 3 or 4 drops of light engine oil in the bearings of the breaker unit every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles. Oil the magneto as directed on page dealing with type used.

TIMING.—Time the magneto to the engine as directed on the page dealing with the type magneto used. It is essential that both systems operate simultaneously, that is, both breakers must open at the same instant. To time the battery system to the magneto, proceed as follows: Turn the engine slowly by hand until the magneto breaker contacts are just beginning to separate, with the grounding switch closed in order that no spark will occur. Loosen the battery breaker unit on its driving shaft. Remove the distributor cap and turn the sleeve until the breaker contacts are just beginning to separate. Then make the sleeve fast to the driving member in this position, replace the distributor cap, and connect the high tension cables to the plugs in the proper firing order, making sure that both systems produce sparks in the same cylinder at the same instant.

CONNECTIONS.—Proper connections are shown in Figure 3. Essential connections made by the switch in the four positions of the handle are as follows:

"Off" position—"2" connected to "6". "5" open.
 "Batt" position—"2" connected to "6". Primary winding of coil connected between "5" and "1". Secondary winding of coil connected between "4" and "6".
 "Mag" position—"2" open. "5" open.
 "Batt" and "Mag" position—"2" open. Primary winding of coil connected between "5" and "1". Secondary winding of coil connected between "4" and "6".

Bosch Magneto, Types DU and ZR, Dual
Plate No. 370

BOSCH MAGNETO TYPES DU AND ZR, DUAL

ROTATION.—The direction in which the magneto must be driven is indicated by an arrow at the drive end.

BREAKER CONTACTS.—Breaker contacts separate .014 to .016 inch. They are made of platinum. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Put 2 or 3 drops of light engine oil in each of the magneto oilers every two weeks. Apply a small amount of vaseline to the fiber bumper of the contact arm with a toothpick. If car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Turn the engine crankshaft until the piston in No. 1 cylinder is in the position where the spark is desired to occur. Place the breaker housing in the fully retarded position, by turning it as far as it will go in the direction of armature rotation. Remove the breaker cap and turn the armature shaft until the breaker contacts are just beginning to separate. Then couple the magneto to the engine, being careful not to change the relative position between the armature shaft and driving member. Remove the distributor block and note which segment is in contact with the distributor brush. Replace block and connect the terminal of this segment with the plug in No. 1 cylinder. Connect the other cables in accordance with the firing order of the engine.

SPARK PLUG GAPS.—Spark plug gaps are .020 to .030 inch, depending upon the characteristics of the engine.

DUAL COIL.—Connections made by the switch in the three positions of the handle are as follows:

"Off" position—"2" connected to "6". "5" open.

"Batt" position—"2" connected to "6". Primary winding of coil connected between "5" and "1". Secondary winding of coil connected between "4" and "6".

"Mag" position—"2" open. "5" open. "3" connected to "4".

For the purpose of starting on the spark, where no starting motor is provided, a magnetic vibrator may be cut into the coil circuit by turning the button in the center of the coil face, to the right. The coil is provided with with a key and lock, by means of which the switch may be locked in the "Off" position.

BOSCH TWO SPARK IGNITION SYSTEM

Wiring Diagrams
For Independent and Dual Systems

BOSCH DUAL TWO SPARK IGNITION SYSTEM

Plate No. 371

BOSCH MAGNETO

TYPES D, DR AND ZR, TWO-SPARK, INDEPENDENT AND DUAL

OPERATION.—The purpose of a two-spark ignition system is to produce ignition at two points in the combustion chamber, thus cutting down the time interval between ignition and complete combustion, which in turn adds power and efficiency to the engine. Bosch two-spark magnetos are produced in either independent or dual types. In external appearance the two-spark magneto is very similar to the single-spark type, the chief difference being the distributor and the fact that there is an extra safety gap. On the single-spark type of magneto one end of the secondary is grounded, while on the two-spark type both ends are brought out to two segments diametrically opposite on a single slip-ring. Two slip ring brushes are provided, which are horizontally located on opposite sides of the magneto end plate. During the portions of the armature rotation when the secondary is delivering current, each of the brushes will be in contact with a slip ring segment. One brush is connected to the inner distributor as in a single-spark magneto, while the other brush is connected to the outer distributor by means of a short cable passing around the magnets. The distributor rotor is of double length and carries two brushes, insulated from each other.

BREAKER.—Breaker contacts separate .015 inch. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Put 2 or 3 drops of light engine oil in each of the oil cups every two weeks. Put a small amount of vaseline on the cam, applying with a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Turn the engine crankshaft until the piston in No. 1 cylinder is in the position where the fully retarded spark is desired to occur. Turn the magneto shaft until the breaker contacts are just beginning to separate, with the breaker housing in the fully retarded position. Couple the magneto to the engine. The use of two-spark ignition does not require the same amount of advance as the single-spark type, due to the much shorter time which elapses between ignition and complete combustion. The effect of retarding the spark results if one set of plugs is cut out of operation.

SPARK PLUG GAPS.—Spark plug gaps are .016 to .030 inch, depending upon the characteristics of the engine.

SPARK PLUG LOCATION.—No advantage is secured from the use of two-spark magnetos if the spark plugs are located close together. They must be separated by at least one-half of the width of the combustion chamber, inclusive of valve-pockets. In "T" head engines it is customary to place the plugs in the inlet and exhaust valve caps.

DUAL COIL.—The coil is the same as is used with the single-spark dual system. In both the independent and dual systems a switch is arranged to cut one set of plugs out of operation by grounding one end of the secondary winding of the magneto.

BOSCH MAGNETO TYPES DU4 AND DU6, SINGLE SPARK, INDEPENDENT

BREAKER CONTACTS.—Breaker contacts separate .014 to .016 inch. They are made of platinum. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Put 2 or 3 drops of light engine oil in each of the magneto oilers every two weeks. Apply a small amount of vaseline to the fiber bumper of the contact arm with a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Turn the engine crankshaft until the piston in No. 1 cylinder is in the position where the spark is desired to occur. Place the breaker housing in the fully retarded position by turning it as far as it will go in the direction of the armature rotation. Remove the breaker cap and turn the armature shaft until the breaker contacts are just beginning to separate. Then couple the magneto to the engine, being careful not to change the relative position between the armature shaft and driving member. Remove the distributor block and note which segment is in contact with the distributor brush. Replace block and connect the terminal of this segment with the plug in No. 1 cylinder. Connect the other cables in accordance with the firing order of the engine.

SPARK PLUG GAPS.—Spark plug gaps are .020 to .025 inch.

Plate No. 373

BOSCH DUPLEX IGNITION SYSTEM

OPERATION.—This system is intended to produce easy starting. The battery side is not intended to be used as a separate ignition system, as is the case in dual systems; but to aid the magneto in producing a hot spark at low speeds. When the switch is in the "Battery" position (center), the single winding in the coil is in series with the battery and the breaker contacts of the magneto. The primary winding of the magneto is shunted around the breaker contacts in the usual manner. In order that the battery may aid the magneto, the current from the battery must flow through the magneto winding in the same direction in which the current produced in the winding is flowing. Since the magneto current reverses as the shuttle revolves, a commutating device is provided in order that the current from the battery will reverse also, and at the same time. This commutator consists of two metal segments on the inside of the breaker box cover and two carbon brushes which revolve with the breaker, making contact with the segments. The switch should be placed in the "M" position when the engine is running. Except for the commutator described above, the magneto is the same as the corresponding type of independent magneto, and the instructions given for them also apply when equipped for duplex ignition.

COMBINED COIL AND SWITCH.—Type M. The connections made in the switch in the three positions of the handle are as follows:
 "Off" position.—"B+M1" connected to "M2". "B—" open.
 "Batt" position.—"B+M1" open. Coil connected between "B—" and "M2".
 "Mag" position.—No connections within switch.
 The other coils are the same, except that the battery is entirely disconnected from the magneto in the "Off" and "Mag" positions. The coil may be removed from its case by removing the screw in the flange, when the switch handle is in the position "B".

Dimensions are in millimeters
Calculate 25.4 mm to the inch.

Dimensions of Bosch Duplex Coils

Fig. 2 —Method of connecting buzzer to magneto primary circuit, for accurately setting the relation of contact opening, to rotor position.

Plate No. 374

SPLITDORF DIXIE MAGNETO

OPERATION.—The Dixie magneto is of the inductor type. The coil, consisting of primary and secondary windings, is wound around a stationary, soft iron core. The permanent field has two movable pole pieces, which rotate past the ends of this core, thus reversing the direction of magnetism through the core and producing a high pressure by the same elementary process as in the ordinary shuttle-wound armature.

BREAKER.—Breaker contacts separate .020 inch. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper. To accurately set the action of the breaker in relation to the position of the armature, proceed as follows: Connect a buzzer in series with two dry cells and the breaker of the magneto as shown in Figure 2. Turn the armature shaft very slowly in the proper direction of rotation, until the buzzer ceases to buzz. This is an indication that the breaker contacts have separated. With the rotor in this position, the air gap between the edge of the rotor and the stationary core must be .015 to .035 inch. In case the air gap does not measure within the specified limits, the breaker base may be shifted within the bearing holder. Loosen the four holding screws which pass through the slotted holes in the breaker base. If the rotor gap is too small, move the breaker base in the same direction in which the cam rotates in operation. If the rotor gap is too large, move the breaker base in the opposite direction to that which the cam rotates. When the proper adjustment has been secured, tighten the four holding screws.

OILING.—Fill the oil cups with light engine oil every month. Apply one drop of oil to the breaker bar bearing. If the car is driven more than 1000 miles in a month, the oiling must be done every 1000 miles.

TIMING.—Turn the engine crankshaft until the position in No. 1 cylinder is in the position where the fully retarded spark is desired to occur. Turn the magneto shaft in the direction in which it is to operate until the breaker contacts are just beginning to separate, with the breaker in the fully retarded position. Couple the magneto to the engine, being careful not to disturb the relative position between the armature shaft and driving member. Determine which distributor terminal is in contact with the distributor brush, and connect that terminal to the plug in No. 1 cylinder. Connect the other terminals and plugs in accordance with the firing order of the engine.

SPARK PLUG GAPS.—Spark plug gaps are .020 to .025 inch.

EISEMANN MAGNETO

TYPES EA, EU AND ED, SINGLE SPARK, INDEPENDENT AND DUAL

ROTATION.—Direction in which magneto must be driven is indicated by an arrow at the drive end.

BREAKER.—Breaker contacts separate .016 inch. They are made of platinum. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Put 2 or 3 drops of light engine oil in each of the oil wells every month. Apply a small amount of vaseline to the fiber bumper of the contact arm, with a toothpick. If the car is driven more than 1000 miles in a month, these attentions must be given every 1000 miles.

TIMING.—Turn the engine crankshaft until the piston in No. 1 cylinder is in the position where the fully retarded spark is desired to occur. Place the breaker housing in the fully retarded position by turning it as far as it will go in the direction of armature rotation. Turn the armature shaft in the direction in which the magneto is to be driven until the breaker contacts are just beginning to separate. Couple the magneto to the engine, being careful not to disturb the relative position between the armature shaft and the driving member. Determine which distributor terminal is in contact with the distributor brush, and connect that terminal with the plug in No. 1 cylinder. Connect the other terminals and plugs in accordance with the firing order of the engine. On the dual type of magnetos, the battery breaker contacts separate 10° later than the magneto breaker contacts.

SPARK PLUG GAPS.—Spark plug gaps are .016 inch.

DUAL COIL, TYPE DT.—The connections made by the switch in the three positions are as follows:

"Off" position—"Ma" connected to "Ground". "+" open.

"Batt" position—"Ma" connected to "Ground". Primary winding of coil connected between "+" and "Ground". Secondary winding of coil connected between "H" and "Ground".

Mag" position—"Ma" open. "+" open. "H" connected to "HM"

DUAL COIL, TYPE D2U.—The connections made in the switch for the three positions of the handle are as follows:

"Off" position—"Ma" connected to "M". "+" open.

"Batt" position—"Ma" connected to "M". Primary winding of coil connected between "+" and "R". Secondary winding of coil connected between "H" and "M".

"Mag" position—"Ma" open. "+" open. "H" connected to "HM".

These coils are equipped with a mechanical vibrator operated by turning the small handle on coil face. This device aids starting, when no electric starter is provided.

TO OPERATE WITHOUT COIL.—The dual magnetos may be operated without the coil by connecting terminals "H" and "HM" on the magneto with high tension cable, and connecting a grounding switch to terminal "Ma". (See Fig. 4.)

Plate No. 376

EISEMANN MAGNETO

TYPE GN-6, SINGLE SPARK, INDEPENDENT

BREAKER CONTACTS.—Breaker contacts separate .015 inch. They are made of platinum. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Put 1 or 2 drops of light engine oil in each of the magneto oilers every month. If the car is driven more than 1000 miles in a month, the oiling must be done ever 1000 miles.

TIMING.—Turn the engine crankshaft until the piston in No. 1 cylinder is in the position where the spark is desired to occur. Remove the distributor block and turn the armature shaft until the setting mark on the distributor disc is in line with the indicator. Use the setting mark "R" if magneto rotation is clockwise (drive end), and "L" if counter-clockwise. In this position of the armature and with the breaker housing fully retarded, the breaker contacts are just separating. Couple the magneto to the engine, being careful to maintain the exact relative position between magneto shaft and driving member.

SPARK PLUG GAPS.—Spark plug gaps are .030 inch.

CONNECTING CABLES.—Plate 150A shows the method of fastening the high tension cables and the grounding wire.

Eisemann Magneto
Plate No. 377

EISEMANN MAGNETO TYPES EMA-4 AND EMA-6, SINGLE SPARK, INDEPENDENT

ROTATION.—The direction in which the magneto must be driven is indicated by an arrow at drive end.

BREAKER.—Breaker contacts separate .015 inch. They are made of platinum. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or well worn No. 00 sandpaper.

OILING.—Put 2 or 3 drops of light engine oil in each of the oil wells every month. Put a small amount of vaseline on the fiber bumper of the contact arm, applying with a toothpick. If the car is driven more than 1000 miles in a month, these attentions must be given every 1000 miles.

TIMING.—Turn the engine crankshaft until the piston in No. 1 cylinder is in the position where the fully retarded spark is desired to occur. Turn the magneto shaft until "No. 1" appears in the glass dial in the distributor plate. Then insert the special key in the slot in the rear of the governor housing to lock the armature shaft in this position. With the breaker assembly fully retarded, the breaker contacts must be just beginning to separate. Couple the magneto to the driving member. Remove the key before any attempt is made to drive the magneto. Connect No. 1 terminal on the distributor plate to the plug in cylinder No. 1, and connect the other terminals and plugs in accordance with the firing order of the engine.

SPARK PLUG GAPS.—Spark plug gaps are .016 inch.

AUTOMATIC SPARK CONTROL.—Automatic spark control is accomplished by the action of centrifugal force on two weights attached at one end to a sleeve and hinged at the other end to the magneto. The armature shaft passes through the sleeve and has spiral ridges which fit in similarly shaped splines in the sleeve. When the armature is rotated the weights begin to spread and exert a pull on the sleeve, which in turn changes the position of the armature with reference to the pole pieces. In order that this control may be applicable to all engines, spindles of varying pitches are obtainable, allowing 19, 25, 38, 45 and 60 degrees advance.

GROUNDING SWITCH.—Two types of grounding switches are supplied. The key type switch is usually used on pleasure cars and the kick type on commercial vehicles. Both types lock the ignition in the "Off" position when the key or switch handle is removed.

Plate No. 378

EISEMANN MAGNETO TYPES EM-4 AND EM-6, SINGLE-SPARK, DUAL

ROTATION.—Direction in which magneto must be driven is indicated by an arrow on the oil hole cover at the drive end.

BREAKER.—Breaker contacts separate .015 inch. They are made of platinum. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Put 3 or 4 drops of light engine oil in each of the oil wells every month. Apply a small amount of vaseline to the fiber bumper of the contact arm, with a toothpick. If the car is driven more than 1000 miles in a month, these attentions must be given every month.

TIMING.—Turn the engine crankshaft until the piston in No. 1 cylinder is in the position where the fully retarded spark is desired to occur. Place the breaker assembly of the magneto in the fully retarded position by turning it as far as it will go in the direction of rotation of the armature. Turn the armature until the figure No. 1 appears at the glass dial in the distributor plate. With the armature in this position, the breaker contacts must be just beginning to separate. Couple the magneto to the engine, being careful not to disturb the relative position between the magneto shaft and driving member. The battery breaker contacts separate 10° later than the magneto breaker contacts. This is to insure a retarded spark for starting.

SPARK PLUG GAPS.—Spark plug gaps are .016 to .030, depending upon the characteristics of the engine.

COMBINED COIL SWITCH.—Types DC and DCR. The connections made by the switch in the three positions of the handle are as follows:

“Off” position—“Ma” connected to “M”. “+” open. “R” open.

“Batt” position—“Ma” connected to “M”. “+” connected to “R” through the primary winding of the coil. Secondary winding of coil connected between “M” and “H”.

“Mag” position—“Ma” open. “H” connected to “HM”. “+” open.

Type DCR Coil is equipped with a mechanical vibrator which supplies a shower of sparks for starting. The Type DC Coil has a push button, enabling the operator to cause a single spark to occur in the plug which is connected to the coil through the distributor.

TO OPERATE WITHOUT COIL.—Magneto may be operated as an independent type by connecting terminals “HM” and “H” on the magneto with high tension cable. Remove the wires from terminals “H” and “R”. The wire from terminal “Ma” must connect with a grounding switch in order to render the magneto inoperative when it is desired to stop the engine.

Plate No. 379

EISEMANN MAGNETO

TYPES G4, G4-I EDIT, G4-II EDIT, SINGLE-SPARK, INDEPENDENT
TYPE GR4-II EDIT, SINGLE-SPARK, DUAL

ROTATION.—The direction in which the magneto must be driven is indicated by an arrow on the drive end.

BREAKER.—Breaker contacts separate .010 to .012 inch. They are made of platinum. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Independent Types. Put 1 or 2 drops of light engine oil in each of the oil wells every month. If the car is driven more than 1000 miles in a month the oiling must be done every 1000 miles.

OILING.—Dual Type. Put 1 drop of light engine oil in the oil well at the breaker end every month. Put 15 drops in the large oil hole at the drive end and 4 or 5 drops in the smaller oil hole. If the car is driven more than 1000 miles in a month, the oiling must be done every 1000 miles.

TIMING.—Turn the engine crankshaft until the piston in No. 1 cylinder is in the position where the fully retarded spark is desired to occur. Remove the distributor plate from the magneto and turn the shaft until the setting mark on the disc is in line with the indicator. If magneto rotates clockwise (drive end) use the setting mark "R", and if counter-clockwise, use the setting mark "L". With the armature in this position, and the breaker assembly fully retarded, the breaker contacts must be just beginning to separate. Couple the magneto to the engine, being careful not to disturb the relative position between the armature shaft and the driving member. Connect distributor terminal marked "1" to the plug in No. 1 cylinder. Connect the other terminals in accordance with the firing order of the engine. On the Dual Type Magneto, the battery breaker contacts separate 10° later than the magneto breaker contacts, to insure a retarded spark for starting.

SPARK PLUG GAPS.—Spark plug gaps are .015 to .030 inch, depending upon the characteristics of the engine.

CONNECTED CABLES.—The special method of connecting the high tension cables and grounding wire are shown in Plate 153B for the Independent Types, and in Plate 153C for the Dual Type.

DUAL COIL.—Types DC and DCR. The connections made by the switch in the three positions of the switch handle are as follows:

"Off" position—"Ma" connected to "M". "+" open.

"Batt" position—"Ma" connected to "M". "+" connected to "R", through the primary winding of the coil. "H" connected to "M" through the secondary winding of the coil.

"Mag" position—"Ma" open. "H" connected to "HM". "+" open.

TO OPERATE WITHOUT COIL.—The dual type magneto may be operated as an independent type by connecting terminals "HM" and "H" on the magneto with high tension cable. Remove the wires from terminals "H" and "R". The wire from terminal "Ma" must connect with a grounding switch in order to render the magneto inoperative when it is desired to stop the engine.

Plate No. 380

EISEMANN MAGNETO TYPE EB-4, SINGLE-SPARK, DUAL

ROTATION.—The direction in which the magneto must be driven is indicated by an arrow on the drive end.

BREAKER.—Breaker contacts separate .016 to .030 inch. They are made of platinum. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Put 2 or 3 drops of light engine oil in each of the oil wells every month. Put a small amount of vaseline on the fiber bumper of the contact arm, applying with a toothpick. If the car is driven more than 1000 miles in a month, these attentions must be given every 1000 miles.

TIMING.—Turn the engine crankshaft until the piston in No. 1 cylinder is in the position where the fully retarded spark is desired to occur. Place the breaker assembly of the magneto in the fully retarded position by turning as far as it will go in the direction of armature rotation. Turn the armature shaft until "No. 1" appears at the glass dial in the distributor plate. With the armature in this position, the breaker contacts must be just beginning to separate. Couple the magneto to the engine, being careful not to disturb the relative position of the armature shaft and driving member. The battery breaker contacts separate 10° later than the magneto breaker contacts.

SPARK PLUG GAPS.—Spark plug gaps are .015 to .030 inch, depending upon the characteristics of the engine.

COMBINED SWITCH AND COIL.—Type BD. The connections made by the switch in the three positions of the handle are as follows:

"Off" position—"Ma" open. "+" and "-" open.

"Batt" position—"Ma" open. "-" connected to "R". Primary winding of coil connected between "+" and "M". Secondary winding of coil connected between "H" and "M".

"Mag" position.—Primary winding of coil connected between "Ma" and "R". Secondary winding of coil connected between "H" and "M". "+" and "-" open. This magneto is of the low tension type and cannot be operated without the coil.

EISEMANN MAGNETO TYPES A8, BK AND BL, LOW TENSION, SINGLE-SPARK, INDEPENDENT OR DUAL

ROTATION.—Direction in which magneto must be driven is indicated by an arrow on the gear wheel case.

BREAKER.—Breaker contacts separate .015 inch. They are made of platinum. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—The grease cup at the end of the distributor driving gear shaft must be kept filled with soft cup grease. Put 3 or 4 drops of light machine oil in the wick oilers every month. If the car is driven more than 1000 miles in a month, these attentions must be given every 1000 miles.

TIMING.—Turn the engine crankshaft until the piston in cylinder No. 1 is in the position where the fully retarded spark is desired to occur. Place the breaker housing in the fully retarded position by turning it as far as it will go in the direction of armature rotation. Turn the magneto armature shaft until the breaker contacts are beginning to separate. Couple the magneto to the engine, being careful not to disturb the relative position between armature shaft and driving member. Determine which terminal of the distributor is in connection with the distributor brush, and connect that terminal with plug in No. 1 cylinder. Connect the other plugs and terminals in accordance with the firing order of the engine.

SPARK PLUG GAPS.—Spark plug gaps are .016 inch.

OPERATION.—The connections when operating as an independent type are shown in Plate 155A. By the use of a special switch, the same magneto and coil may be used to provide dual ignition. Connections are shown in Plate 155B. The brass bar on the breaker box, which connects terminals "A" and "B" on the independent type, must be altered to connect terminals "A" and "C".

Plate No. 382

Wiring Diagram

K-W MAGNETO

TYPES T AND TK, SINGLE-SPARK, INDEPENDENT

ROTATION.—Direction in which magneto must be driven is indicated by an arrow on the drive end bearing cap. To reverse direction of rotation, remove the breaker cam, turn it around end for end, and replace. Remove the three screws which hold the distributor moulding and segment to the large gear, and turn the moulding until the second set of screw holes in the gear are under those in the moulding. Replace the screws.

BREAKER.—Breaker contacts separate .016 inch. They are made of platinum. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Put 2 or 3 drops of light engine oil in each of the oil holes every month. If the car is driven more than 1000 miles in a month, the oiling must be done every 1000 miles.

SPARK PLUG GAPS.—Spark plug gaps are .016 inch.

TIMING.—Turn the engine until the piston in cylinder No. 1 is in the position where the fully retarded spark is desired to occur. Turn the magneto shaft until the distributor segment is making connection with brush No. 1, which is the lower left hand terminal post. (The segment can be seen through the window in the center of the distributor block.) Place the breaker housing in the fully retarded position by turning it as far as it will go in the direction of armature rotation. Then turn the armature shaft very slightly in either direction until the breaker contacts are just beginning to separate. Couple the magneto to the engine, being careful not to disturb the relative position between the armature shaft and driving member. Connect No. 1 terminal to the plug in No. 1 cylinder, and the other terminals and plugs in accordance with the firing order of the engine.

IMPULSE STARTER.—To time Type TK magneto with impulse starter, trip the starter dog into engagement. Turn the impulse starter until the cam on the starter case is beginning to raise the dog out of engagement. This is the proper position of shaft for coupling to the engine.

Plate No. 383

K-W MAGNETO

TYPES H, HT AND HK, SINGLE-SPARK, INDEPENDENT

ROTATION.—Direction in which the magneto must be driven is indicated by an arrow on the drive end bearing dust cap. To reverse the direction of rotation of magnetos not equipped with impulse starter, remove the breaker cam, turn it around end for end and replace. Remove the distributor disc moulding from the large distributor gear, by removing the three screws. Turn the disc until the second set of screw holes in the gear are under those in the disc. Replace the screws.

BREAKER.—Breaker contacts separate .016 inch. They are made of platinum-iridium. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper. There is a hole provided in the side of the breaker box in order that contact gap may be conveniently adjusted. The entire breaker assembly may be easily removed by pushing the contact spring aside.

OILING.—Put 2 or 3 drops of light engine oil in each of the oilers every month and put 1 drop on the wick in the roller on the upper contact arm of the breaker. If the car is driven more than 1000 miles in a month, the oiling must be done every 1000 miles.

TIMING.—Turn the engine crankshaft until the piston in No. 1 cylinder is in the position where the fully retarded spark is desired to occur. Place the rocker arm (A) in the horizontal position. (See Plate 158A.) Turn the shaft of the magneto until the distributor brush is in contact with the segment (S), which connects with the No. 1 terminal. Then turn the shaft very slightly in either direction until the breaker contacts (P) are just separating. Couple the magneto to the engine, being careful not to alter the relative position between the armature shaft and driving member. Connect the distributor terminal No. 1 to the plug in No. 1 cylinder. Connect the other terminals and plugs in accordance with the firing order of the engine.

SPARK PLUG GAPS.—Spark plug gaps are .016 inch.

MEA MAGNETO

TYPES SC, SC2 AND SS, SINGLE-SPARK, DUAL

BREAKER.—Breaker contacts separate .016 inch. They are made of platinum. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Put 2 or 3 drops of light engine oil in each of the oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

TIMING.—Turn the engine crankshaft until the piston in No. 1 cylinder is in the position where the fully advanced spark is desired to occur. Turn the magneto shaft until No. 1 appears in the window in the front plate of magneto. Place the breaker in the fully advanced position by turning as far as it will go against the direction of armature rotation. Then turn the shaft very slightly in either direction until the breaker contacts are just beginning to separate. Couple the magneto to the engine, being careful not to disturb the relative position between armature shaft and driving member. Connect the No. 1 terminal on the distributor block of the magneto to the plug in No. 1 cylinder, and the other terminals and plugs in accordance with the firing order of the engine.

SPARK PLUG GAPS.—Spark plug gaps are .016 inch.

SPECIAL.—Never remove the top cover supporting the high tension carbon while the magneto is running, as this cover contains the safety gap, and the insulation of the windings is apt to be punctured if magneto is turned while it is off.

Remove the magneto from the base when bolting the latter to the frame, and see that the bolts do not project across the inside surface of the base, otherwise they may injure the magneto housing. In tightening the nut at the front end of the armature shaft hold the shaft by the coupling. Do not try to prevent it from turning by holding the breaker.

The breaker may be easily removed from the case by removing the long center screw holding the breaker to the armature shaft, and screwing it into the small tapped hole provided in the breaker base, so that it may be used as a handle to lift the breaker out. In replacing the breaker, the small pin at its back must be introduced into the slot provided in the armature. Care must be taken not to tighten the screw before this pin is in place.

If magneto has been taken down, it is important that the armature and the distributor gears be placed in the proper relative position to each other. To facilitate so placing them, three holes are drilled in the end shield, the distributor gear and the end plate of the armature, in such a position, that if the three parts in question are in line, the relation between armature, breaker and distributor is correct. In assembling, all that is necessary is to insert a pin into the hole in the end shield and set gears so that pin will pass through all three holes.

Plate No. 385

ROTATION.—Magneto may be driven in either direction, without change or adjustment.

BREAKER.—The make-and-break lever and flat spring separate .031 inch when the cam is in the position shown in Plate 196A. If the ignition is at fault and the engine misses at slow speed, with the spark control retarded, turn the breaker contact adjusting screw to the left one-quarter turn or more. If the engine misses at high speed with the spark control advanced, turn the adjusting screw to the right, one-quarter turn or more. Resurface breaker contacts with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Put 3 or 4 drops of light engine oil in each of the four oilers every month. Put 2 or 3 drops of oil on the breaker cam. If the car is driven more than 1000 miles in a month, the oiling must be done every 1000 miles.

TIMING.—Turn the engine crankshaft until the piston in No. 1 cylinder is in the position where the fully retarded spark is desired to occur. Remove distributor plate. The distributor segment on the Types S and T Magnetos have two arrows marked upon it, one for each direction of rotation. The segment on the Type L magneto has one arrow mark. To change direction of rotation turn the segment over. Turn the magneto shaft until the arrow on the segment registers with the terminal point which is to be wired to the plug in No. 1 cylinder. With the armature in this position and the breaker housing fully retarded, the breaker contacts should just be separating. Couple the magneto to the engine, being careful not to disturb the relative position between the armature shaft and driving member. Connect the distributor terminals and plugs in accordance with the firing order of the engine.

SPARK PLUG GAPS.—Spark plug gaps are .025 to .030 inch.

Continued on next page.

-THE REMY MAGNETO HAS BUT ONE ADJUSTMENT

REMY MAGNETO

REMY MAGNETO TYPE RL, LOW TENSION, INDUCTOR TYPE

ROTATION.—Direction in which magneto must be driven is indicated by an arrow at drive end.

BREAKER.—Breaker contacts separate .020 to .025. They are made of platinum. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Put 3 or 4 drops of light engine oil in each of the magneto oilers every month. If the car is driven more than 1000 miles in a month, the oiling must be done every 1000 miles.

TIMING.—Turn the engine crankshaft until the piston in No. 1 cylinder is in the position where the spark is desired to occur. Press in the timing button at the top of the distributor block and turn the magneto shaft until the plunger of the button drops into the hole in the distributor gear. With the breaker box fully retarded, the contacts will be just separating when the armature is in this position. Couple the magneto to the engine, being careful not to disturb the relative position between the armature shaft and the driving member. Wire terminal No. 1 on the distributor to plug No. 1, and the other plugs in accordance with the firing order of the engine.

SPARK PLUG GAPS.—Spark plug gaps are .020 to .025 inch.

Plate No. 387

Plate No. 388

REMY MAGNETO

TYPES P AND 32, LOW TENSION, SINGLE-SPARK, DUAL
TYPES 30 AND 31, LOW TENSION, TWO SPARK, DUAL

BREAKER.—Breaker contacts separate .015 inch. They are made of platinum-iridium. When the condition of the contacts affects the ignition, resurface with worn No. 00 sandpaper, or a fine, flat jeweler's file.

OILING.—Put 3 or 4 drops of light engine oil in each of the oilers every month. Apply a small amount of vaseline to the bumper of the contact arm, with a toothpick. If the car is driven more than 1000 miles in a month, the oiling must be done every 1000 miles.

TIMING.—Turn the engine crankshaft until the piston in No. 1 cylinder is in the position where the fully retarded spark is desired to occur. Press in the timing button at the top of the distributor block, and turn the magneto shaft until the plunger of the bottom drops into the hole in the distributor gear. With the armature in this position and breaker housing fully retarded, the breaker contacts must be beginning to separate. Couple the magneto to the engine. If the direction of rotation of the magneto is clockwise (drive end), connect the lower left-hand terminal on the distributor block to the plug in No. 1 cylinder. If the rotation is counter-clockwise, connect the lower right-hand terminal to No. 1 plug. Connect the other terminal and plugs in accordance with the firing order of the engine.

SPARK PLUG GAPS.—Spark plug gaps are .020 to .030 inch.

NOTE.—If no other electrical apparatus is used on the car, either terminal of the battery may be connected to either terminal of the coil. If, however, other electrical equipment is used, requiring a ground connection, the positive terminal of the battery must be connected to the terminal marked "R".

Ford

Sedan and Coupe Models (1919) Liberty F. A. Starting and Lighting System Ford Ignition

Battery.—Battery is 6 volt, 80 ampere-hour. The negative (—) terminal is grounded.

Ignition:—See page 390 (next page)

Starter.—The starter is connected to the engine through a Bendix drive. Without load, starter should draw 70 amperes at 5.7 volts. It should crank the normal engine at 150 R. P. M., taking 160 amperes at 5 volts. Cold engine, heavy oil, tight bearings or other obstructions, or damp, grounded or short circuited windings will cause high current and low speed during the cranking operation. Discharged, dry or sulphated battery, defective battery connections, defective switch contacts, defective starter connections, dirty commutator, high mica, dirty or sticking brushes, defective connections between armature coils and commutator bars or open circuits are the chief causes of low speed and low current.

To remove the starter it is necessary to first remove the engine pan on the left hand side of the engine. Then remove the starter shaft cover from the transmission cover by taking out the four small screws. Turn the Bendix drive shaft around so that the set screw on the end of the shaft is in a horizontal position and points outward. Under the set screw is a lock washer with two extensions on opposite sides, one being turned against the collar and the other against the side of the set screw head. Bend back the extension which has been forced against the screw and remove the latter. Then pull the Bendix assembly out of the housing. Next remove the four screws which hold the starter housing to the transmission cover and pull out the starter, taking it down through the chassis.

Oiling.—Starter requires no oiling. The rear bearing receives oil by splash from the fly-wheel, and the forward bearing is of the oilless type.

Generator.—Generator current regulation is by third brush method. Normal maximum output should be 10 amperes at 20 miles per hour, or 1200 R. P. M., of generator armature. Maximum output may be varied from 8 to 12 amperes by altering the position of the third brush. Third brush holder is fastened to the brush ring by a bolt which is free to move in a slot in the ring, when its nut is loosened. Cold resistance of the four field coils should be 2.45 ohms. The generator is removed by taking out the three cap screws holding it to the front end cover, and forcing it backward and downward by inserting a screw driver between the generator and front end cover. If engine is run with battery disconnected from the generator, be sure to ground the generator terminal to the frame or engine.

Oiling.—Put 4 or 5 drops of light engine oil in the rear bearing oiler every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Relay.—Relay is mounted either on the dash (see Plate 423), or on top of generator frame (Plate 424). Relay should close at 10 miles per hour or 600 R. P. M., of generator armature, and should open at 8 miles per hour, or 480 R. P. M., of generator armature. Charging current at closing should be 2-3 amperes, and discharge current 0-2 amperes at opening of relay contacts. Relay may be adjusted by bending the spring on the movable arm or by adjusting the distance between the contacts. The contact points should separate .032 inch. Clean relay contacts by drawing a piece of unglazed paper between them. If badly burned or pitted, resurface with a strip of worn No. 00 sand paper and then draw a piece of unglazed paper between them to remove all grit and adjust before again putting into service.

Lamps.—Head lamps are 6-8 volt, 17 cp. Dimmer lamps are 6-8 volt, 2 cp. Tail lamp is 6-8 volt, 2 cp.

FORD IGNITION

Ford Model T

Ford Generating, Lighting and Ignition System

FORD
MODEL T
FORD IGNITION AND LIGHTING SYSTEM

Plate No. 390

Magneto.—The magneto is carried in the flywheel housing. It delivers alternating currents to four vibrator coils as the timer closes the circuit in the proper sequence. Sixteen permanent horse shoe magnets, mounted on the flywheel, revolve in front of sixteen stationary coils. The clearance between the soft iron cores of the coils, and the pole pieces of the revolving element should be .031 inch (1-32 inch). To remove the magneto it is necessary to remove the engine, crank case and transmission cover. Then take out the four cap screws that hold the flywheel to the crank shaft. When a new set of magnets is received from the service station, they are arranged on a board in their proper order. Like poles of adjacent magnets must be together. To take out the old magnets, simply remove the cap and bronze screws which hold them in place. See that the connection between terminal of magneto winding and binding post connection in top of crank case cover is clean.

Timer.—Timer spring should be strong enough to insure a good contact between roller and segments. If badly worn, timer should be replaced. To remove timer, remove cotter pin from spark control rod and detach latter. Loosen cap screw which goes through breather pipe. This will loosen the spring which holds the timer in place, and it can easily be removed. Unscrew lock nut, withdraw steel brush cap and drive out the retaining pin. It can then be removed from the cam shaft. In replacing the brush, be sure that the exhaust valve on No. 1 cylinder is closed when the brush points upward. This may be done by removing valve door and watching No. 1 valve.

Oiling.—Timer must be kept clean and well oiled at all times. Put 8 or 10 drops of light engine oil in the oiler every two weeks. In very cold weather, about one-fourth kerosene and three-fourths lubricating oil should be used in timer, as oil alone will often form a film over contacts which roller cannot remove, preventing electrical connection.

Timing.—Timer roller should just make connection with the segment connected to No. 1 coil when No. 1 piston is on top dead center entering power stroke, spark control lever and timer housing in the fully retarded position.

Firing Order.—The firing order is 1, 2, 4, 3.

Spark Plug Gaps.—Spark plug gaps should be .030 inch to .032 inch.

Vibrator Coils.—When the vibrating arms are held down, the gap between the contacts should be .027 inch to .030 inch. An adjusting nut and lock nut are provided on the stationary arm for making this adjustment. Clean vibrator contacts by drawing a piece of unglazed paper between them. If badly burned or pitted, resurface with a fine, flat jeweler's file or a strip of well worn No. 00 sand paper. Draw a piece of unglazed paper between them to remove all grit, and adjust before again putting into service. Constant buzzing of one or more coils will indicate a ground in wiring from timer. If the spring on the vibrator is too tight, it will take an excessive amount of current to pull it down, making starting hard. Pitted or dirty contacts will cause missing. To find a missing cylinder, hold down vibrators on No. 1 and No. 4 coils. If cylinders 2 and 3 fire irregularly, hold down vibrators on coils 1 and 2, and free 1 and 4. If one of the two then free to operate is missing, hold down one more vibrator. Examine spark plug, wiring and vibrator of the missing cylinder.

To Install Dry Cells.—Five dry cells should be used, connected in series. Ground one terminal to the car frame, and connect the other battery terminal to the lower left hand post on the coil box, when viewed from the back of the dash.

Lamps.—Head lamps are connected in series and are each 9 volt, 15 cp.

Ford

Genemotor Starting and Lighting System

Battery.—Battery is 12 volts, 45 ampere-hour. The two wire system is used.

Starter.—Starter is connected to the engine by silent drive chain or by gear. It should deliver 45 pound-feet lock torque. It should crank engine at about 150 R. P. M. Cold engine, heavy oil, tight bearings or other obstructions, or damp, grounded or short circuited windings or commutator bars will cause low speed and excessive current during the cranking operation. Discharged battery, defective connections in starting circuit, defective switch contacts, dirty commutator or defective brushes will cause low speed and low current or failure of starter.

Generator.—Generator current regulation is by third brush system. Relay is mounted on the unit. Relay should close at 9-10 miles per hour. Clean contacts by drawing a piece of unglazed paper between them. If badly burned or pitted, resurface with a piece of well worn No. 00 sand paper, drawing a piece of unglazed paper between them, to remove all grit, before again putting into service. Maximum output of generator should not exceed 10 amperes.

Oiling.—Refill cup in front bearing with soft cup grease and turn down every two weeks. At the same time grease gear teeth through hole in gear guard. Also put a few drops of light engine oil in each of the motor-generator oilers every two weeks. On machines having chain drive, grease chain every two weeks. If car is driven more than 500 miles in two weeks the oiling must be done every 500 miles.

Lamps.—Head lamps are 12-16 volts, 16 cp., vacuum, or 12-16 volts, 24 cp., gas-filled. (The gas-filled lamps are not advisable ordinarily as they will cause excessive glare.) Tail lamp is 12-16 volts, 3 cp.

Plate No. 391

For Ford Cars

Battery.—The battery is 6 volt, 70 ampere-hour. The positive (+) terminal is grounded.

Generator.—Generator current regulation is by third brush system or vibrating type regulator. Relay should close at 7-10 miles per hour. Charging current should be 1-3 amperes at closing and the discharge current $\frac{1}{2}$ -2 amperes at opening of relay contacts. There is a screw to adjust relay. The charging current should be 8-12 amperes at 12-14 miles per hour on cars using vibrating regulator and 12-15 amperes at 13-18 miles per hour, reducing to 10 amperes at high speed, on cars having third brush regulation. Clean relay and regulator contacts by drawing a piece of unglazed paper between them. If badly burned or pitted, resurface them with a piece of well worn No. 00 sand paper, drawing a piece of unglazed paper between them, to remove all gnt, and adjust, before again putting into service. When possible, regulator should be adjusted with a fully charged battery in circuit. Regulator and relay are adjusted by turning the knurled screw provided.

Oiling.—Put several drops of light engine oil in each of the motor and generator oil cups every two weeks. At the same time, lubricate the chain well with light engine oil, wiping the excess oil from the surface, after time has been allowed for it to penetrate to the inner bearings, to prevent the collection of dirt. If car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

Lamps.—Head lamps are 6-8 volts, 17 cp. Side lamps are 6-8 volts, 5 cp. Tail lamp is 6-8 volts, 2 cp.

Ford

Hydro-Pneumatic Starting and Lighting System

Batt ry.—Battery is 6 volts, 85 ampere-hour. The negative (—) terminal is grounded.

Starter.—Starter and generator are combined into one unit but are electrically separate. The motor armature is mounted above the generator armature. Starter is connected to the engine through a Bendix drive, engaging the gear on the generator shaft. Cold engine, heavy oil, tight bearings or other obstructions or damp, grounded or short circuited windings will cause high current and low speed during the cranking operation. Discharged, dry or sulphated battery, defective battery connections, defective switch contacts, defective starter connections, dirty commutator, high mica, dirty or sticking brushes, defective connections between armature coils and commutator bars or open circuits are the chief causes of low speed and low current.

Oiling.—Put several drops of light engine oil in each of the starter oilers every two weeks.

Generator.—Generator current regulation is by a vibrating regulator mounted on top of the frame. Relay is combined with regulator. Relay should close at six miles per hour. Charging current should be about 4 amperes at closing. Generator output should be 10-12 amperes at ten miles per hour. To adjust relay-regulator, first insert an ammeter (if the equipment does not include one) in the line leading from terminal marked "Bat +". Start engine and speed up slowly. If the relay contacts do not close at an engine speed equal to 6 miles per hour, the spring tension may be too great. Decrease by bending the upper support at (C). See that there is then sufficient spring tension to cause relay contacts (A) to separate when the discharge current reaches 0.2 amperes. If generator output exceeds 10-12 amperes at speeds above ten miles per hour, the regulator contacts (B) are not opening as they should. The spring tension on regulator armature (moving member) should then be decreased by bending the support (D) upward. To increase charging rate reverse this operation. Clean relay and regulator contacts by drawing a piece of unglazed paper between them. If badly burned or pitted, resurface with a piece of well worn No. 00 sand paper, drawing a piece of unglazed paper between them to remove all grit, and adjust before again putting into service.

Oiling.—Put 4 or 5 drops of light engine oil in each of the generator oilers every two weeks. Also lubricate the chain with light engine oil at the same time. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Lamps.—Head lamps are 9 volts, 21 cp. Dash lamp is 6-8 volts, 2 cp. Tail lamp is 6-8

Current Regulator and Battery Cutout

The Starter Mounted in Front of the Radiator

The Starter Mounted Under the Hood

Plate No. 395

Ford

Kemco Starting and Lighting System

Battery.—Battery is 6 volt, 100 ampere-hour. The negative (—) terminal is grounded.

Starter.—Starter is chain connected to the engine crank shaft. It should deliver 16 pound-feet lock torque. Cold engine, heavy oil, tight bearings or other obstructions, or damp, grounded or short circuited motor windings or commutator bars will cause high current and low speed during the cranking operation.

Oiling.—Starter bearings are packed with soft cup grease. Put in 1 or 2 drops of light engine oil every month to keep grease soft.

Generator.—Generator current regulation is by a vibrating type regulator. Relay is combined with regulator. Relay should close at 8 miles per hour (500 R. P. M. of generator). Maximum generator output of 12-14 amperes should be reached at 20 miles per hour (1250 R. P. M. of generator). Clean relay and regulator contacts by drawing a piece of unglazed paper between them. If badly burned or pitted, resurface with a piece of well worn No. 00 sand paper, drawing a piece of unglazed paper between them to remove all grit, and adjust before again putting into service.

Oiling.—Generator bearings are packed with soft cup grease. They should be thoroughly cleaned out and grease renewed every six months. Put in 1 or 2 drops of light engine oil every month to keep grease soft.

Lamps.—Head lamps are 6-8 volts, 17 cp. Tail lamp is 6-8 volts, 5 cp. Double contact base is used.

Ford

North East, 24 Volt, Starting and Lighting System

Battery.—Battery is 24 volt, 25 ampere-hour. The two wire system is used.

Starter.—Starter and generator are combined to form a single unit. Starter should deliver 36 pound-feet torque when taking 150 amperes. Cold engine, heavy oil, tight bearings, or other obstructions or damp, grounded or short circuited windings will cause high current and low speed during the cranking operation. Discharged, dry or sulphated battery, defective battery connections, defective switch contacts, defective starter connections, dirty commutator, high mica, dirty or sticking brushes, defective connections between armature coils and commutator bars or open circuits are the chief causes of low speed and low current.

Oiling.—Motor-generator bearings are packed with soft cup grease. They should be thoroughly cleaned out and grease renewed once a season. No oil is required.

Generator.—Generator current regulation is by a vibrator regulator. The normal maximum output should be 6 amperes.

Relay-Regulator.—Relay is combined with regulator. Relay should close at 9-10 miles per hour. Charging current should be 3 amperes at closing, and the discharge current 0 to 1 amperes at opening of relay. The air gap between regulator coil core and armature should be .025 inch. Generator output may be increased by increasing the spring tension on regulator armature, or decreased by decreasing the spring tension. Clean relay-regulator contacts by drawing a piece of unglazed paper between them. If badly burned or pitted, resurface them with a piece of well worn No. 00 sand paper, drawing a piece of unglazed paper between them to remove all grit. Adjust before again putting into service.

Lamps.—Head lamps are 12-16 volts, 18 cp. Side lamps are 12-16 volts, 4 cp. Dash lamp is 12-16 volts, 2 cp. Tail lamp is 12-16 volts, 4 cp.

Fuse.—Generator fuse is 10 ampere.

Model Numbers.—Motor-generator is Model D, Type 1210.

Plate No. 396

PLATE

Ford Simms-Huff System

Battery.—Battery is 12 volt, 35 ampere-hour. The negative (—) terminal of one set of 3 cells is grounded.

Starter-Generator.—Starter and generator are combined to form a single unit. The starter operates at 12 volts and the generator at 6 volts. Depressing the starting pedal connects the two halves of the battery in series for starting. When pedal is released, the two halves are connected in parallel for charging. Starter should deliver 24 pound-feet lock torque. The shunt and series fields work together, producing increased torque when operating as a motor, and against each other, limiting the current, when operating as a generator. There are three series coils wound on alternate poles, each grounded at its inner end.

Generator.—Generator current regulation is by combined vibrating regulator and reverse series field. Maximum rate should be 10-15 amperes, reached at 16-18 miles per hour. Charging rate should be 12 amperes, armature turning $\frac{1}{2}$ at 1200 R. P. M. On generators below serial No. 27,000, the resistance of the shunt field circuit is 6.5 ohms, and on machines having serial numbers above 27,000, it is 4.8 ohms. When operating freely as a motor, generator should take 7 amperes at 6 volts pressure. Excessive current indicates damp, grounded or short circuited windings, tight bearings or armature striking pole pieces. Less current indicates defective connecting, dirty brushes, dirty commutator or high mica.

Oiling.—Put several drops of light engine oil in each of the motor-generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Relay-Regulator.—Relay and regulator are combined into one unit. Relay should close when the generator voltage reaches 14 volts. Two carbon contacts operate in parallel with the main contacts which are of copper. It is important that the copper contacts separate before and close after the carbon contacts, so that no arcing can take place at the former. If they do not, sticking of the relay or failure to open will result. Generator output may be increased by increasing spring tension of regulator armature (moving member), and decreased by decreasing tension. If output continues to increase above 15 amperes as speed increases, regular contacts are not opening as they should. In this case spring tension should be decreased and regulator contacts should be cleaned by drawing a piece of unglazed paper between them.

Lamps.—Head lamps are 6-8 volts, 18-21 cp. Tail lamps are 6-8 volts, 2 cp.

Ford

Splitdorf Starting and Lighting System

Battery.—Battery is 12 volt, 45 ampere-hour. The two wire system is used.

Starter.—Starter is chain connected to the engine crank shaft. Starter operates at 12 volts while generator and other equipment operates at 6 volts pressure. The starting switch changes battery connections so as to connect the two halves in series for starting and in parallel for charging. Cold engine, heavy oil, tight bearings, tight chain or other mechanical obstructions, or damp, grounded or short circuited motor windings or commutator will cause low speed with excessive current during the cranking operation. Discharged battery, defective battery connections, defective switch contacts, defective motor terminals, sticking brushes or dirty commutator will cause low speed with low current during cranking operation. Abnormal wear of brushes may be due to starting switch pedal sticking in hole in floor board. See that hole is large enough to allow switch to return to its normal position, and that good contact is made. This may be ascertained by removing switch cover. When the starting switch is depressed, the current flows from the terminal marked +A on the battery (See diagram) to +A on starting switch, through switch to +M and to +M on motor, through latter to -D on motor, to -B-D on switch, to -B on battery, through battery to +B on battery, then to +B on switch, through switch to -A, then to -A on battery and through battery returning again to +A, the starting point.

Oiling.—Put 4 or 5 drops of light engine oil in each of the motor-generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Generator.—Generator current regulation is by reverse series field. Cutout relay (indicating automatic switch) is located on the dash. It should indicate "Charge On" at speeds above 7-9 miles per hour and "Charge Off" at speeds below 6-8 miles per hour car speed. Clean relay contacts by drawing a piece of unglazed paper between them. If badly burned or pitted, resurface them with a piece of well worn No. 00 sand paper, drawing a piece of unglazed paper between them to remove all grit, and adjust, before again putting into service. Generator should deliver 15 amperes at 1500 R. P. M. When relay closes, charging current flows from +D (See diagram) on generator to +D on relay, through relay windings and contacts and out at +B on relay then to +A on

starting switch where it divides. one side leading to +A on battery, through battery to -A on starting switch. The other part of the current flows through a jumper in switch to +B on starting switch, through to +B on battery, on through battery to -B on starting switch. It will be noted that the common return points of the current at the starting switch are -B -D, from which the current flows to -D on generator. If it is necessary to operate generator with battery disconnected, connect terminal -D and +D on generator to prevent burning out of windings and lamps.

Lamps.—Head lamps are 6-8 volts, 17 cp. Tail lamp is 6-8 volts, 2 cp. Double contact base is used.

FORD
SPLITDORF SYSTEM

Plate No. 399

Dash board wiring.

Plate No. 400

Ford Vesta System

Battery.—Battery is 6 volt, 80 ampere-hour. The two wire system is used.

Starter.—There is no starter supplied to this system.

Generator.—Generator is of the permanent field type. Two types of generators are supplied, the large type, D, and a smaller type F. There is no current or voltage regulation except that which takes place due to armature reaction. The machine is designed to deliver its normal output at average driving speeds.

GENERATOR DATA.

Model D		Model F

1500.....	7	2500.....	7.5
1715.....	8		
1960.....	9		
2200.....	10		

There is no relay. There is a centrifugally operated governor at one end (See Plate No. 241A) which automatically disconnects generator from battery when the armature speed drops below that required to charge battery.

Oiling.—Put 3 or 4 drops of light engine oil in each of the generator bearing oilers and put one drop of oil on governor pivots every two weeks. At the same time lubricate the driving chain well, using light engine oil. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Lamps.—Head lamps are 6-8 volts, 14 cp. Dimmer lamps are 6-8 volts, 2 cp. Side lamps are 6-8 volts, 2 cp. Dash and tail lamps are in series. They are each 3-4 volts, 2 cp.

PLATE NO.

Diagram Showing Cutout Assembly and Parts Numbers.

Plate No. 401

Ford

Westinghouse Starting and Lighting System

Battery.—Battery is 12 volt, 45 ampere-hour. The positive (+) terminal is grounded.

Ignition.—The standard Ford ignition or the standard Westinghouse ignition, with a special drive, may be used. Westinghouse breaker contacts should separate .006 inch to .008 inch. Should they become burned or pitted, resurface them with a fine, flat jeweler's file. The springs should exert just enough pressure on the distributor brushes to force them $\frac{1}{4}$ inch past the top of the holder when the distributor cap is removed, but should retain them firmly so that they do not tend to fall out. Brushes must move freely in their holders. Be sure that both brushes are in place when replacing the rotor. (There is a brush on both the top and bottom side of the rotor.)

Timing.—Contacts should begin to separate when the piston entering power stroke is on top dead center, spark control lever about three notches from the fully retarded position.

Firing Order.—The firing order is 1, 2, 4, 3.

Spark Plug Gaps.—Spark plug gaps should be .025 inch.

Ballast Resistor.—There is a ballast resistor in the ignition switch. In case it is necessary to operate the car with the ballast defective, a 5 ampere fuse may be used temporarily, but the ballast must be replaced as soon as possible, as continued operation without it will result in serious burning of the timer contacts.

Oiling.—Put several drops of light machine oil in the oiler at the side of breaker every month. If car is driven more than 1000 miles in a month, the oiling must be done every 1000 miles.

Starter.—Starter-generator is chain connected to the engine crank shaft. Cold engine, heavy oil, tight bearings or damp, grounded or short circuited motor windings or commutator bars will cause low speed with excessive current during the cranking operation. Discharged battery, defective switch contacts, defective battery connections, defective motor connections, sticking brushes or dirty commutator or high mica will cause low speed and low current.

Oiling.—Put 5 or 6 drops of light engine oil in each of the starter-generator oilers every month. If car is driven more than 1000 miles in a month, the oiling must be done every 1000 miles.

Generator.—Generator current regulation is by third brush system. Relay is mounted in the starting switch. Relay should close at 9 miles per hour. Charging current should be 1 to 1.5 amperes at closing and .75 to 1.25 amperes at opening of contacts. Air gap between relay armature (moving member) and coil core should be .027 inch to .030 inch. Contacts should separate .013 inch to .017 inch. Adjust by bending the brass prongs. Clean contacts by drawing a piece of unglazed paper between them. If badly burned or pitted, resurface with a piece of well worn No. 00 sand paper, drawing a piece of unglazed paper between them, to remove all grit, before again putting into service.

Lamps.—Head lamps are 12-16 volts, 16 cp. Dimmer lamps (when used) are 12-16 volts, 6 cp. Dash lamp (when used) is 12-16 volts, 3 cp. Tail lamp is 12-16 volts, 3 cp. All lamps have single contact base. Either the regular Ford head lamps with a dimming resistance or Westinghouse lamps with dimmer bulbs may be used.

Fuse.—Lighting fuse is 10 ampere.

Plate No. 402

Bosch, or Rushmore, Starter

The Bosch, or Rushmore, starter as it is sometimes called, is made in nine sizes, as given below, with the size battery and cables used with each:

Motor Type	Voltage	Ampere Capacity	Main Cable Gauge	Shunt Cable Gauge
A8,813	6	160	00	4
A8,913	12	80 to 100	00	4
B2, B5	6	120 to 150	00	4
C3	6	100 to 120	0	6
B2, B5	12	80	0	4
C3	12	50 to 60	1	6
C18	12	50 to 60	3	6
C41	12	35 to 50	2	6
C42	6	80 to 100	1	6

When very long cables are used, as is sometimes the case in motor boats, the size next largest to that tabulated should be used for the main cable, the shunt cable remaining the same size as tabulated.

When the starting pedal is depressed, the moving contact in the starting switch is moved along three stationary contacts in the switch. The armature is so constructed as to have considerable end play. There is a spring at the commutator end, which holds the armature in position so that the pinion is clear of the flywheel gear when current is off. When connection is made between the movable contact and the first, or shunt, and the second contact in the switch, a large current is allowed to flow through the shunt field. This acts as a powerful electro-magnet and draws the armature into the working position in the motor. As the pinion is fastened to the end of the motor shaft, it is drawn into mesh with the flywheel gear. A small current also flows through the resistance and the armature, causing the latter to turn slowly. This is to facilitate meshing of the gears. When connection is made between the moving contact and the last stationary contact in the switch, the full battery pressure is applied to the motor, turning it with full power, cranking the engine. As the engine begins to run on its own power and the speed of the motor increases, the attraction between the armature and the field poles decreases, due to the decreased current caused by the greater back pressure, and the demeshing of the gears results. No harm can come of keeping the starting switch closed after gears are demeshed, as the motor will be running at full speed, thus not consuming enough current for the attraction between the field poles and the armature to overcome the spring pressure. When the foot is removed from the starting pedal, the switch is returned to its normal position by a spring. The foot should always be removed entirely from the pedal so as not to hinder the quick action of the spring. Should the starting pedal be depressed so rapidly that the gears do not have time to mesh, the motor will rotate freely. In this case the pedal must be released and the motor allowed to come to rest before switch is closed again.

Each end of the motor is provided with an oiler feeding oil to the bearing and shaft by means of a wick. If starter is used only normally, three or four drops of oil should be put in each of the oilers every 1000 miles. If starter is used frequently, four or five drops of oil must be put in each oiler every 500 or 600 miles. In cases where starter is on a marine engine, it should be oiled every three weeks. Use good, clean, light machine oil.

Electrical circuit established when switch pedal has completed its downward movement.

Bosch Lighting Systems

Types DSR and DSG Generators

Battery.—Battery is 6 volt, 100 ampere-hour, or 12 volt, 50 ampere-hour. The two wire system is used or the positive (+) terminal is grounded.

Generator.—Type DSR. Current regulation is by reverse series field, operating in conjunction with a regulating resistance. This regulating resistance is connected in shunt with the reverse series field. When cold this unit has a very small resistance, but when hot it has a greatly increased resistance. When cold it forms practically a short circuit across the series field terminals, allowing but little current to flow through the series field. As the current through the resistance increases, the temperature and resistance increases, causing more current to flow through the reverse winding, reducing the output. As the resistance of the regulating coil increases in proportion to the current through it, the output is held practically constant at speeds above that necessary to produce the maximum output. The current output may be varied by changing the size of the regulating resistance. Maximum current output is 9 amperes.

Generator.—Type DSG. Types DSG5, 6, 7, 8, 107 and 108 have reverse series field current regulation. Types DSG105 and 106 are also compound wound, but the series winding conducts current to the lamps only, and assists the shunt field by strengthening the magnetism. To facilitate wiring, the generator terminals are numbered 1, 2, 3 and 4. These terminals are connected to the relay terminals bearing corresponding numbers. The outputs of the various types are as follows:

Generator Type	Voltage	Maximum Ampere Output
DSG5	12	7
DSG6	6	14
DSG7	12	9
DSG8	6	18
DSG105	12	5
DSG106	6	10
DSG107	12	6
DSG108	6	12

Oiling.—Put 2 or 3 drops of light engine oil in each of generator bearing oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Relay.—Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sand paper. Remove all grit. Adjust before again putting into service.

DYNETO MODELS A AND B, SINGLE UNIT SYSTEM.
Plate No. 404

Dyneto

MODELS A AND B

SINGLE UNIT GENERATING, STARTING AND LIGHTING SYSTEM

BATTERY.—Battery is 12 volt, 50-70 ampere hour. The negative (—) terminal is grounded on cars using grounded system.

STARTER.—Starter and generator are combined to form a single unit. Armature is permanently chain connected to engine crankshaft. There are two different size machines—Model A and a larger Model B. Torque of Model A machine is 8 pound-feet and torque of Model B is 7½ pound-feet, at 400 R.P.M. of armature. Lock torque of Model A is 30 pound-feet and of Model B, 40 pound-feet.

Starter Data.—Model B.

Torque	R.P.M.	Amperes	Volts
0 lb. ft.	800	10	12.0
5 lb. ft.	425	40	11.8
10 lb. ft.	300	65	11.5
15 lb. ft.	230	95	11.2
20 lb. ft.	175	112	10.4
25 lb. ft.	110	140	10.2
30 lb. ft.	75	160	10.2
40 lb. ft.	Lock	210	9.6

GENERATOR.—Generator current regulation is by third brush system. There is no relay. Generator Model A begins to supply current at 1000 R.P.M., and Model B at 900 R.P.M. Output of 5 amperes is reached by Model A at 1200 R.P.M., and by Model B at 1150 R.P.M. Maximum output of 10 amperes is reached by Model A at 1600 R.P.M., and by Model B at 1400 R.P.M., of armature.

Generator Data. Model B.

Amperes	M.P.H
0.0	7.5
5.0	9.0
7.5	10.0
10.0	12.5
12.5	17.5
10.0	27.5
6.0	50.0

OILING.—Put several drops of light engine oil in each of starter-generator bearing oilers every two weeks. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.

LAMPS.—Head lamps are 14-16 volt, 15-24 cp. Side or dimmer lamps are 12-14 volt, 4-6 cp. Dash and tail lamps are in series. They are each 6-8 volt, 2 cp.

Dyneto

Models UA and VA

Two Unit Generating, Starting and Lighting System

Battery.—Battery is 6 volt, 80-130 ampere-hour. The negative (—) terminal is grounded when the grounded system is used.

Starter.—Model UA. Starter is connected to engine through a Bendix drive.

STARTER DATA

Torque	R. P. M.	Amperes	Volts
0 lb. ft.	3000 +	40	5.6
2.5 lb. ft.	1350	160	5.2
5.0 lb. ft.	650	280	4.7
7.5 lb. ft.	300	380	4.4
10.0 lb. ft.	Lock	480	4.0

Oiling.—Put several drops of light engine oil on the felt washer at commutator end and the felt wick at driving end every month.

Generator.—Model VA. Generator current regulation is by a vibrating regulator. Generator begins to supply current at 7-9 miles per hour. Maximum current of 10-12 amperes is reached at 14-16 miles per hour.

Amperes	GENERATOR DATA	M. P. H.
0		8
5		11
10		13
12		15
10		40

Oiling.—Put several drops of light engine oil on felt washer at commutator end and the felt wick at driving end every month. If car is driven more than 1000 miles in a month, oiling must be done every 1000 miles.

Relay.—Relay and regulator are combined into one unit. Relay closes at 7-9 and opens at 5-7 miles per hour. Charging current is 1-3 amperes at closing and the discharge current 0-1 ampere at opening of relay. Clean relay and regulator contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sand paper. Remove all grit. Adjust before again putting into service.

Lamps.—Head lamps are 6-8 volt, 15-24 cp. Side or dimmer lamps are 6-8 volt, 4-6 cp. Dash lamp is 6-8 volt, 2 cp. Tail lamp is 6-8 volt, 2 cp.

Plate No. 406

GRAY & DAVIS

GENERATING, STARTING AND LIGHTING SYSTEM

TYPES T AND S GENERATORS. TYPE Y STARTING MOTOR

BATTERY.—Battery is 6 volt, 80-120 ampere-hour. The positive (+) terminal is grounded at the starting motor or at the starting switch.

STARTER.—Type Y. Starter is connected to the engine through a non-automatic mechanical pinion shift. The sliding pinion (Plate No. 198A) is moved along the shaft when the starting pedal is depressed. If the pinion is in the proper position to mesh with the flywheel gear, it is meshed immediately. If it is not in such a position, the switch rod is moved on, compressing the spring and closing the starting switch. As soon as the motor starts to turn, the compressing spring forces the pinion into mesh. There is an overrunning clutch to prevent the engine driving the starter at excessive speed.

OILING.—Put 5 or 6 drops of light engine oil in the oilers at commutator end and intermediate shaft bearings every month. Every three months remove the plug in the gear case and inject one tablespoonful of heavy motor oil.

Gray & Davis Starting and Lighting System, as Applied to the Velie, Model 15

Gray & Davis Starting and Lighting System as applied to Chalmers 6-40.

Plate No. 407

GRAY & DAVIS

GENERATING, STARTING AND LIGHTING SYSTEM TYPES T AND S GENERATORS. TYPE Y STARTING MOTOR

Continued from preceding page.

GENERATOR.—Types T and S. Generator output regulation is by vibrator-regulator. The Type T Generator is rated at 10 amperes, 6.5 volts, 1000 R.P.M. The Type S Generator is rated at 10 amperes, 6.5 volts, 650 R.P.M. Maximum charging rate is reached at 10 miles per hour. Charging rate varies slightly with condition of the battery, being highest when battery is discharged and decreasing as battery charges.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY-REGULATOR.—Relay and regulator are combined to form a single unit. Relay closes at 8 miles per hour and opens at 6 miles per hour. Terminal "L", the terminal on the relay-regulator to which the lights are connected, is a tap taken off the series winding of the relay-regulator, some distance from the end, and conducts current to lamps and horn only. When the lamps are turned on, the frequency at which regulator armature (moving member) operates is reduced, increasing the output in proportion to the lamp load. Adjust regulator to limit the maximum current output to 10 amperes at speeds above 10 miles per hour. To adjust contacts, hold one set apart and adjust the other set until the desired output is obtained. Then hold the first set apart and adjust the other set until the desired output is obtained. Then allow both sets to operate together. Increasing spring tension will increase the output. Decreasing spring tension will decrease the output.

LAMPS.—Head lamps are 6-8 volt, 16 cp. Side lamps are 6-8 volt, 4 cp. Dash and tail lamps are each 6-8 volt, 2 cp.

North East System

1913

For Columbus, Galt, Havers, Imperial 34, Marmon 32,
Michigan, Pullman and Warren Cars

Battery.—Battery is 16 volt, 50 ampere-hour. There is a tap taken off the middle connector to supply 8 volts for lights and horn. The two wire system is used.

Starter-Generator.—Starter and generator are combined into one unit. Armature is connected to the engine through a set of reduction gears and an overrunning clutch. Either Model A, Type 1000 or Model A, Type 2000 motor-generator may be used. Type 1000 rotates counter-clockwise. Type 2000 rotates clockwise. Starter should deliver 12 pound-feet torque when taking 46 amperes. Less torque with this current indicates damp, grounded or short circuited motor windings or commutator bars, field connected wrong, tight bearings or armature striking pole pieces. Cold engine, heavy oil, tight bearings or other mechanical obstructions, or damp, grounded or short circuited motor windings or commutator bars will cause low speed and excessive current, during the cranking operation. Discharged, dry or sulphated battery, defective battery connections, defective switch contacts, defective motor connections, sticking brushes, dirt, commutator, high mica or broken connections between armature coils and commutator bars are the chief causes of low speed with low current during cranking operation or when testing starter for torque as above.

Generator.—Generator current regulation is by reverse series field and a vibrating regulator. Generator should normally deliver 7 amperes.

Oiling.—Keep a liberal amount of grease in the reduction gear case at all times. Put several drops of light engine oil in the bearing oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

MICHIGAN, PULLMAN AND WARREN CARS

Relay-Regulator.—Relay is combined with regulator. Two types of relay regulators may be found in use. Circuits when the polarized type is used are shown in Fig. 1. Circuits when the later or electro-magnetic type relay-regulator is used are shown in Fig. 2. In case it is necessary to make more than very minor repairs on the old (No. 1900) type regulator it is advisable to replace the regulator with a new (No. 1197), improved type regulator. To install this new unit it is necessary to cut out the bosses on the commutator end bearing in which the studs holding the original relay were screwed, to provide the clearance required to prevent grounding of the nuts which secure the units to their base-board. As a further precaution against grounding, cut away that portion of the gasket retainer which would be liable to come in contact with the relay armature (moving member). Fasten down the baseboard by screwing the resistance unit studs into the holes used by the former unit. Before connecting relay, draw out all leads to take up any slack inside of starter generator and secure, to prevent their working back. Any loose wires inside frame have a tendency to be drawn between armature and pole pieces. Connect as shown in diagram and adjust. Relay should close at 1000 R. P. M. of generator armature. Charging current should be 3 to 4 amperes at closing and the discharge current 0 to 1 amperes at opening of relay contacts. Generator should normally deliver 7 amperes. Output may be increased by increasing spring tension, and decreased by decreasing spring tension. Air gap between regulator coil core and armature (moving member) should be .025 inch. Air gap between relay armature (moving member) and coil core should be .030 inch. Decreasing gap will decrease cut in and increase cut out current. By proper combination of these two adjustments the desired relay-regulator action may easily be obtained. Clean relay and regulator contacts by drawing a piece of unglazed paper between them. If burned or pitted, resurface with a piece of well worn No. 00 sand paper, drawing a piece of unglazed paper between them, to remove all grit and adjust before again putting into service. There is a 5 ampere fuse in the shunt field circuit, mounted on generator frame.

Lamps.—Head lamps are $8\frac{1}{2}$ volts, 15 cp. Side lamps are 6-8 volts, 4 cp. Dash lamps are 6-8 volts, 2 cp. Tail lamp is 6-8 volts, 2 cp. Some of the Marmon cars were equipped with 24 cp. head lamps. Double contact base is used on all lamps.

Fuse.—Generator fuse is 5 ampere.

Plate No. 410

North East Starting and Lighting System

For Marmon 48 (1913-14)

Cunningham Model M, Havers 44 and 45

Imperial 32, 34, 49, 44, 54, 56 and

Marmon 41 (1914)

Battery.—Battery is 16 volt, 35 ampere-hour, on Imperial cars, and 16 volt, 50 ampere-hour on all other cars. There is a tap taken off the middle cells to supply 8 volts to lamps and horn. The two wire system is used.

Starter-Generator.—Starter and generator are combined to form a single unit. When operating as a starting motor the unit is connected to the engine through a set of reduction gear and an overrunning clutch. It should deliver 20-22 pound-feet lock torque, taking 80-95 amperes at 6.25 volts, voltage measured across brushes. Cold engine, heavy oil, tight bearings or other obstructions, or damp, grounded or short circuited windings will cause high current and low speed during the cranking operation. Discharged, dry or sulphated battery, defective battery connections, defective switch contacts, defective starter connections dirty commutator, high mica, dirty or sticking brushes, defective connections between armature coils and commutator bars or open circuits are the chief causes of low speed and low current.

Generator.—The unit operates as a generator when engine is running and starter pedal is released. Generator current regulation is by a vibrating regulator. Generator output should be 6 amperes at 1500-3000 R. P. M. of armature.

Oiling.—Put 4 or 5 drops of light engine oil in each of the motor-generator bearing oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles. Keep a liberal amount of grease in the reduction gear case at all times.

Relay-Regulator.—Relay is combined with regulator. Relay should close when pressure of generator reaches 20 volts. Generator must be driven 1000 R. P. M. to produce this pressure. The charging current should be 2-3 amperes at closing and the discharge current 0 to 1 ampere at opening of relay contacts. Air gaps between relay armature and coil core should be .030 inch. To increase output of generator, increase spring tension on regulator armature (moving member). To decrease output, decrease spring tension. Air gaps between regulator armature and coil core should be .025 inch. There are two resistance units, each having a resistance of 14 ohms. Clean relay and regulator contacts by drawing a piece of unglazed paper between them. If badly burned or pitted, resurface with a strip of well worn No.00 sandpaper, drawing a piece of unglazed paper between them to remove all grit. Adjust before again putting into service.

Lamps.—Head lamps are 8½ volts, 15 cp. Side lamps are 8½ volts, 4 cp. Dash and tail lamps are in series. They are 3-4 volts, 2 cp.

Plate
North East Model B System

Plate No. 411

WARD LEONARD

GENERATING AND STARTING SYSTEM (1913-15)

BATTERY.—Battery is 6 volt, 80-100 ampere-hour. The two-wire system is used, or the positive (+) terminal is grounded.

STARTER.—Starter is connected to the engine through a Bendix drive, or by a pinion, shifted by the operator.

OILING.—Put 3 or 4 drops of light engine oil in the starter oilers every month. Repack bearing cups with vaseline every three months.

GENERATOR.—Generator current regulation is by vibrating regulator. Maximum current output is 10 amperes, reached at 15 miles per hour.

OILING.—Put 2 or 3 drops of light engine oil in the generator bearing oilers every month. If the car is driven more than 1000 miles in a month, the oiling must be done every 1000 miles. Thoroughly clean out the bearings and repack with soft cup grease every six months.

CONTROLLER OPERATION.—The fine winding of the electro magnet (F, Plate No. 186A) is connected across the brushes of the generator. When the voltage of the generator reaches a value greater than the voltage of the battery, the relay armature (C) is attracted by the core of the electro-magnet (F), which closes the contacts (DD) and completes the circuit between the generator and the battery. The electro-magnet also exerts an attraction on the regulator armature (H). When the current through the heavy winding of the electro-magnet reaches 10 amperes the regulator armature moves toward the core, opening the contacts (EE). The shunt field current, which heretofore passed through the contacts (EE), must now take the path through the resistance coil (M). The shunt field current is reduced, due to the increased resistance, and the magnetic field, voltage and current output of the generator are in turn reduced. The electro-magnet (F) then is not strong enough to hold the armature (H) against the tension of the spring (K), and the contacts (EE), close. The current output increases until the contacts again open. This cycle of operations is repeated rapidly, as the armature (H) vibrates, and maintains a constant current output at all speeds higher than that at which the regulator commences to operate. In the type CD controller, the resistance coil (M) is mounted above the regulator, there being no other difference between Types CC and CD. Type E (Plate No. 186) is the same in operation as Types CC and CD, but uses a separate electro-magnet to operate the regulator armature.

ADJUSTMENT AND CARE.—Relay contacts close at 8-10 and opens at 6-8 miles per hour. Both types are designed to limit the maximum current output of the generator to 10 amperes. The controller cover is sealed in place to prevent incompetent parties tampering with the adjustment. Clean relay and regulator contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into series. Relay and regulator spring tension is adjusted by bending the brass supports.

Plate No. 412

GRAY & DAVIS

GENERATING, STARTING AND LIGHTING SYSTEM (1913-14)

WITH CONSTANT-SPEED GENERATOR

BATTERY.—Battery is 6 volt, 85-130 ampere-hour. The positive (+) terminal is grounded, or the two-wire system is used.

STARTER.—Types H-1, H-2, and K. Starting motor is connected to the engine through a chain and overrunning clutch or a pinion shifted by the operator.

Starter Data. No Load			
Type	Volts	Amperes	R.P.M.
H-1	6	150	1500
H-2	6	150	2600
K	6	100	3600

OILING.—Put 4 or 5 drops of light engine oil in each of the starter oilers every week. With the flywheel type, oil the sliding parts and bearing every week. If the car is driven more than 250 miles in two weeks, the oiling must be done every 250 miles. Inject soft cup or ball-bearing grease in the motor bearings every six months, and in the gear reduction case when used.

GENERATOR.—Types G-1 and E. Internal circuits are shown in Plate No. 500A. Output regulation is by mechanical speed control. Generator is chain driven, the speed ratio being such that the governor shaft revolves at 1000 R.P.M. for Type G-1, and 700 for Type E, when the engine is running at a speed equivalent to 10 miles per hour. The normal maximum outputs with low battery are as follows:

Generator Data				
Type	Volts	Amperes	R.P.M.	M.P.H.
G-1	6.5	9	1000	10
E	6.5	10	700	10

Charging rate decreases as battery becomes charged. The governor is of the shoe-and-shell type. The governor is adjustable by means of a screw, accessible through openings in the shoes and shell. These openings must first be brought into alignment with each other. A narrow screw driver may then be inserted. Turn the adjusting screw to the right to increase the output of the generator and to the left to decrease the output. The generator operates as a simple shunt wound machine, except when supplying current to the lights, when the series winding assists the shunt winding, strengthening the magnetism and increasing the output. Ammeter indications, with the lamps "on" and "off" at speeds above 12 miles per hour, are as follows:

Generator Data.—Ammeter Reading		
Type	Lamps On	Lamps Off
G-1	0.5-1.5	3-9
E	1.0-2.0	4-10

OILING.—Types G-1 and E. Put 5 or 6 drops of light engine oil in the drive end bearing and middle bearing of the generator every two weeks. Inject ball bearing grease between the races of the commutator end bearing. Put 2 or 3 drops of oil on the eight governor joints. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

Continued on next page.

Plate No. 413

GRAY & DAVIS GENERATING, STARTING AND LIGHTING SYSTEM WITH CONSTANT-SPEED GENERATOR

GENERATOR.—Type C-1. Internal circuits are shown in Plate No 500B, except that the terminals are arranged “—”, “S”, “+” from left to right, looking at the commutator end. Generator is chain driven, the speed ratio being such that the governor shaft revolves at 1250 R.P.M. when the engine is running at a speed equivalent to 10 miles per hour. The maximum charging rate with a low battery is 8 amperes, reached at 1250 R.P.M. of the armature or 10 miles per hour. Charging rate decreases as battery becomes charged. The governor is of the disc type, one of the frictional surfaces being faced with asbestos fabric. To adjust the governor, remove the cover and loosen the set screw (No. 4, Plate No. 500B-1) one whole turn. Then insert two screw drivers, one on each side of the shaft, just back of the block (Plate No. 500B-2) and compress the spring. Tighten the set screw. Moving the block up 1/16 inch will increase the output about 2 amperes. The generator operates as a simple shunt-wound machine, except when supplying current for the lamps, when the series winding assists the shunt winding, strengthening the magnetism and increasing the output. Ammeter should indicate 3-8 amperes when running above 12 miles per hour with lamps “Off” and .5 to 1.5 amperes with lamps “On.”

OILING.—Type C-1. The three shaft bearings of the generator must be lubricated with 5 or 6 drops of light engine oil or with soft ball-bearing grease every two weeks. If grease is used, the grease-gun spout must be the exact size to fit the oil holes. Put 4 or 5 drops of light engine oil in the governor bearing oiler (No. 2, Plate No. 500B-1). If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

RELAY.—Relay closes at 10 miles per hour and opens at 8 miles per hour. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

NOTE.—If the governor mechanism is worn out, the generator may be easily reconstructed to give reverse series field current regulation. Instructions for making this change are given on Page 188.

ALLIS-CHALMERS GENERATING AND STARTING SYSTEM

BATTERY.—Battery is 6 volt, 80 ampere-hour. The positive (+) terminal is grounded.
STARTER-GENERATOR.—Model MG9-R or MG9-L. The unit is permanently chain connected to the engine crank shaft.

Starter Data

Torque	R.P.M.	Amperes	Volts
5 lb. ft.	570	120	5.7
10 lb. ft.	400	185	5.5
25 lb. f.	125	375	5.1
36 lb. ft.	Lock	475	4.7

GENERATOR.—The unit operates as a generator when driven by the engine. Generator output regulation is by vibrating regulator. Generator produces 6.6 volts, balancing

RELAY-REGULATOR.—Ward Leonard or Briggs-Stratton. Relay closes at 1140 R.P.M. amperes at 2000 R.P.M. of the armature or 20 miles per hour. The auxiliary contacts in the starting switch serve to disconnect the relay-regulator when the starting switch is depressed, protecting the relay windings.

OILING.—Put 2 or 3 drops of light engine oil in the starter-generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles. Thoroughly clean out and repack the bearings with ball-bearing grease, at 1140 R.P.M. of the armature. Normal maximum charging rate is 10 ing grease every year.

of the armature or 10 miles per hour and opens at 1050-1100 R.P.M. of the armature or 8-9 miles per hour. Regulator is adjusted to limit the charging rate to 10-12 amperes at all speeds above 2000 R.P.M. Adjustment of relay and regulator is made by bending the brass stops controlling the air gaps and spring tension. Clean relay and regulator contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

ESTERLINE

GENERATING AND LIGHTING SYSTEM

BATTERY.—Battery is 6 volt, 100-130 ampere-hour. The two-wire system is used.

GENERATOR.—Models H, EM and E-6. Generator is of the permanent field type, the magnetism being strengthened and controlled by field windings. Generator current regulation is by reverse series field. In the four-wire type (see Plate No. 500D) there are three field windings. In addition to the usual series and shunt coils, there is a second series coil which is in the charging circuit but not in the lamp circuit. When the lamps are turned on, the output automatically increases. There is no adjustment for varying the charging rate.

OILING.—Put 4 or 5 drops of light engine oil in the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 8-10 miles per hour, or from 340 to 560 R.P.M. of the armature, depending upon the model of the generator. Relay opens at 6-8 miles per hour. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

FUSES.—All fuses are 15 ampere.

Plate No. 416

ENTZ

GENERATING AND STARTING SYSTEM

BATTERY.—Battery is 18 volt, 35-70 ampere-hour. The two-wire system is used.

STARTER-GENERATOR.—Two types of starter-generators are used, one with four terminals and one with either five or six terminals. Internal circuits of the four-terminal type are shown in Plate No. 500E-1. Internal circuits of the five or six-terminal type are shown in Plate No. 500E-2. The sixth terminal is a junction post only, having no connection with the motor-generator internally. The unit is permanently chain connected to the engine crankshaft. As there is no relay, the system possesses what is known as the non-stalling feature, that is, the battery is always connected to the motor-generator when the switch is in the "Start" or "On" position, so will turn the armature as a motor when the car is running under 6-8 miles per hour (high gear), helping to propel the car or starting the engine should same become stalled.

GENERATOR.—The unit operates as a generator at speeds above 6-8 miles per hour or 600 R.P.M. of the armature when the switch is in the "Start" position. When the switch handle is in the middle or "Neutral" position, the motor-generator is disconnected from the battery, but the ignition circuit remains closed. This position is used for long daylight drives when it is not advisable to continue charging a fully charged battery or in traffic when the car is being driven below 6-8 miles per hour and the non-stalling feature is not desired. Generator current regulation is by reverse series field. Normal maximum charging rate is 10 amperes, reached at 2400 R.P.M. of the armature or 25-30 miles per hour.

Plate No. 417

JESCO

GENERATING AND STARTING SYSTEM

8-16 VOLT SYSTEM

BATTERY.—Battery is 16 volt, 35 ampere-hour. Battery is divided into two sections of four cells and 8 volts each. The starting switch, when depressed, connects the two sections of the battery in series, providing 16 volts for operating the starter. When the switch is released and the upper contacts are closed, the two sections of the battery are connected in parallel for charging.

MOTOR-GENERATOR.—Starter and generator are combined into one unit. The unit is permanently connected to the engine crank shaft. Generator current regulation is by reverse field, the current through same being controlled by a vibrating regulator. The regulator, cut-out, starting switch and lighting switch are contained in one semi-circular case, usually mounted on the heel board below the driver's seat. The motor-generator has three field windings, as follows: A heavy series coil, the fine shunt coil and a third winding connected in series with the shunt winding and reversed with respect to it. The regulator contacts normally short-circuit this reversed field winding. When the regulator contacts open, the shunt field current must pass through the reversed coils, shunted by the regulator resistance, which reduces the magnetism and hence the current output of the generator. Maximum current output may be varied by means of a lever at the bottom of the controller case. Moving this lever to the right will increase the output and moving it to the left will have the opposite effect. Normal maximum output is 10-15 amperes.

6-VOLT SYSTEM

BATTERY.—Battery is 6 volt, 85-150 ampere-hour. The two-wire system is used.

MOTOR-GENERATOR.—Starter and generator are combined into one unit. The unit is permanently connected to the engine crank shaft. Generator current regulation is the same as that described above for the 8-16 volt system. The relay and regulator are combined into one unit and mounted on the motor-generator frame. The single core carries four windings: A coarse series coil connected in the charging circuit which actuates the regulator armature; a second coarse series coil and a fine shunt coil, comprising the usual relay windings; and a resistance coil, which is connected across the regulator contacts. Regulator is adjustable by turning a screw, which regulates the spring tension on the moving member. Turning this screw out will increase the maximum current output of the generator, and turning it in will have the opposite effect. The normal maximum current output is 15 amperes. Relay is adjusted by bending the bracket which supports the spring. Relay closes at 8-10 and opens at 6-8 miles per hour. Clean relay and regulator contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

DISCO GENERATING AND STARTING SYSTEM SINGLE UNIT SYSTEM

Plate No. 418

BATTERY.—Battery is 12 volt, 35 ampere-hour. Either the negative (—) terminal is grounded, or the two-wire system is used.

MOTOR-GENERATOR.—Starter and generator are combined into one unit. The unit is permanently connected to the engine crankshaft. There is a shunt and series field coil on two poles, the other poles carrying no windings. Generator current regulation is by vibrating regulator. Maximum current output is 10 amperes, reached at 15-20 miles per hour.

RELAY-REGULATOR.—Ward Leonard, Type CD. Relay closes at 7-10 and opens at 5-7 miles per hour. Charging current is 1-3 amperes at closing and the discharge current 0-1 ampere at the opening of relay contacts. Regulator spring tension is adjusted to limit the maximum current output to 10 amperes. Adjustment of both relay and regulator is made by bending the brass prongs which support the springs and determine the air gaps. Clean relay and regulator contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

OILING.—Put 5 or 6 drops of light engine oil in each of the starter-generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

TWO-UNIT SYSTEM

STARTER.—Starter is connected to the engine through reduction gears and overrunning clutch.

OILING.—Put 5 or 6 drops of light engine oil in each of the starter oilers every month.

GENERATOR.—Generator and starter are usually mounted one above the other. Generator has a series and shunt coil on each pole. Current regulation is by reverse series field. Maximum current output is 10 amperes, reached at 15-20 miles per hour.

OILING.—Put 5 or 6 drops of light engine oil in the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Briggs & Stratton. Relay closes at 8-10 and opens at 6-8 miles per hour. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

SYSTEM FOR FORD CARS

STARTER.—Starter is connected to the engine through a Bendix drive.

GENERATOR.—Generator current regulation is by Ward Leonard vibrating regulator.

RELAY-REGULATOR.—See information given above under Single Unit System. Normal maximum charging rate is 10 amperes. Circuits are shown below.

OILING.—See oiling instructions given for Two-Unit System.

Plate No. 419

DEACO

GENERATING AND STARTING SYSTEM

BATTERY.—Battery is 6 volt, 85-100 ampere-hour. The negative (—) terminal is grounded.

STARTER.—Starter is connected to the engine through a pinion shifted by the operator. The same mechanical movement also operates the starting switch. Starting switch first closes the circuit through a resistance, which causes the motor armature to revolve slowly to aid the meshing of the gears and then cuts out the resistance, allowing the full current to flow for cranking.

OILING.—Put 5 or 6 drops of light engine oil in the starter oilers every month.

GENERATOR.—Generator current regulation is by the third brush method. Maximum current output is 15 amperes for the engine-speed generator and 12 amperes for the $1\frac{1}{2}$ times engine-speed generator. Maximum current output is reached at 20 miles per hour. Charging rate is varied by adjustment of the third brush setting. To move the third brush first loosen the two locking screws which pass through a slot in the commutator end plate. Move the brush in the direction of armature rotation to increase the charging rate and in the opposite direction to decrease the charging rate. Reseat the brush after adjusting position.

OILING.—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay is usually mounted on the dash. Relay closes at 8-10 and opens at 6-8 miles per hour. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

SERVICE ENGINEERING COMPANY, SAN FRANCISCO—COPYRIGHTED, 1926

RELAY.—Relay closes at 8-10 and opens at 6-8 miles per hour. Clean the contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with fine emery cloth.

Apelco 6-30 Volt System, As Applied to the Interstate Model 45 (1914)
Plate No. 421

APELCO

6-30 VOLT GENERATING AND STARTING SYSTEM

BATTERY.—Battery is 30 volt, 20 ampere-hour. The two-wire system is used. The battery is divided into five sections of three cells and six volts each. The controller switch connects the five sections in series when in the "Start" position, providing 30 volts' pressure for operating the motor-generator as a starter to crank the engine. When the switch is in the "Run" position, the five sections of the battery are connected in parallel for charging.

MOTOR-GENERATOR.—Starter and generator are combined into one unit. The unit is permanently connected to the engine crankshaft. It is a four-pole, four-brush machine, each pole carrying a series and shunt winding. As a starter, the machine operates at 30 volts' pressure.

GENERATOR.—Generator voltage regulation is by vibrating regulator, known in this system as the "Stop Charge Relay". Maximum charging rate varies with the state of charge of the battery, reaching a maximum of 20 amperes with a low battery.

OILING.—Put 5 or 6 drops of light engine oil in each of the starter-generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY AND REGULATOR.—Relay closes when the voltage of the generator reaches 6.5 volts and opens with a discharge current of 0.2 amperes. Regulator begins to operate at 8 volts, and maintains a constant voltage at that point. To adjust the relay and regulator, connect a voltmeter across the generator terminals and slowly speed up the engine. When the voltmeter indicates 6.5 volts the contacts of the relay should close. If they do not, the relay requires adjustment. Relay adjusting screw must be turned in to increase the cut-in voltage, and out to decrease the cut-in voltage. Continue to increase the speed until the voltmeter indicates 8 volts. At this point, the movable contact arm of the regulator should commence to vibrate. Increase the speed of the engine and note if the voltage remains constant. If not, the regulator requires adjustment. If the regulator commenced to operate before 8 volts was reached, turn the adjusting screw in. If the voltage exceeded 8 volts, turn the adjusting screw out. A small pilot lamp on the top of the controller case glows until the relay closes. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

TOURING AND STARTING SWITCHES.—For information concerning the touring switch or starting switch see Page 424.

Plate No. 423

U. S. L. GENERATING AND STARTING SYSTEM 12 VOLT INHERENTLY REGULATED TYPE

BATTERY.—Battery is 12 volt, 85 ampere-hour. Either the two-wire system is used or the negative (—) terminal is grounded.

MOTOR-GENERATOR.—Starter and generator are combined into one unit. The armature is fastened to the crankshaft, taking the place of the flywheel. There are eight field poles and eight brushes. Six poles carry only series coils, one pole is wound with the shunt coil, and the other pole is wound with a series coil and a coil called the compensating field winding. Starting switch is of the magnetic type, controlled by a button on the dash.

GENERATOR.—Generator output regulation is by reverse field and armature reaction. Maximum current output is 10 amperes, reached at 15 miles per hour or 600 R.P.M. of the armature. In some cases, an external resistance coil is provided, same being connected in series with the shunt field, and the output of the generator may be varied by altering the value of the resistance. However, in most cases no means are provided for adjusting the charging rate. Shunt field winding takes 1.3 amperes at 15 volts. Pressure of the brushes on the commutator is 1¾ pounds.

INSTRUMENT PANEL.—The starting button, ammeter, relay, special shunt field circuit breaker, touring switch, magneto switch, lighting switches and fuses are mounted on the dash panel.

RELAY.—Relay closes at 10 and opens at 8-9 miles per hour. Relay closes at 400 R.P.M. of the armature. Relay contacts separate 1/16 inch. Clean contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before putting into service.

FUSES.—Generator fuse in the "A+" lead is 30 ampere. Other fuses are of 10-ampere capacity.

NOTE.—Terminal "B—" on the Magnetic Starting Switch is Grounded.

Wiring Diagram Instrument Board—Rear View

Plate No. 424

U. S. L.

24-12 VOLT INHERENTLY REGULATED TYPE

BATTERY.—U. S. L., Type EL-1207 or EL-1209, 24 volt, 25 ampere-hour. The two-wire system is used. Battery is divided into two sections of 6 cells and 12 volts each. The starting switch connects the two sections in series, providing 24 volts to operate the motor-generator as a starter to crank the engine, or in parallel when the motor-generator is operating as a generator and charging the battery.

MOTOR-GENERATOR.—Starter and generator are combined into one unit. The armature, which revolves outside the field poles, is fastened to the crank shaft, taking the place of the flywheel. The machine has eight field poles and eight brushes. The generator shunt field winding is wound on one pole only, the other seven poles being wound with the series coils. Generator current regulation is by reverse series field and armature reaction. Only the three lower brushes (the three upper brushes of Plate N. 500N) are used when the machine is operating as a generator. Pressure of these three brushes on the commutator must be $1\frac{3}{4}$ pounds. Pressure of the other five brushes is $1\frac{1}{4}$ pounds. Maximum charging rate is 18 amperes, reached at 20 miles per hour.

STARTING SWITCH.—The starting switch operates in oil, which must be renewed once a year. Before opening the switch case, disconnect the positive (+) battery leads, to prevent accidental short-circuits. Remove the top of the case and pour out the old oil. Make sure all the switch fingers bear properly against the drum. If they do not, they may be made to do so by bending. If contacts are badly burned or pitted, resurface with a fine, flat file. Refill the case with the best grade transformer oil and replace the cover. In Types E-2 and E-3 switches the level of the oil should be $1\frac{5}{8}$ inches from the top of the box, and $2\frac{3}{4}$ inches in the case of the Type E-4 switch.

TOURING SWITCH.—The touring switch enables the operator to control the charging of the battery. Pulling out the switch handle connects the generator and battery when the car is up to speed, and the relay closed. Pushing in the switch handle breaks the charging circuit. Inspect the touring switch every six months. If the switch fingers and contact pieces on the sliding block are not clean, remove and resurface with fine sandpaper or a fine, flat file. In replacing the fingers, bend them so they will make firm contact. In some cases the touring switch is of the small push-button type, and cannot be opened for inspection.

RELAY.—Relay closes at 10 and opens at 8 miles per hour. Charging current is 3-4 amperes at closing, and the discharge current 0-4 amperes at the opening of relay contacts. Clean contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

FUSES.—Two fuses are mounted with the relay. The small fuse is 6 ampere, measures $\frac{1}{4}$ inch diameter, $1\frac{1}{4}$ inches long, and protects the shunt field circuit. The larger fuse is 30-ampere capacity, measures $\frac{3}{8}$ inch in diameter and $1\frac{1}{4}$ inches in length.

ADLAKE SYSTEM

Plate No. 425

ADLAKE GENERATING AND LIGHTING SYSTEM

BATTERY.—Battery is 6 volt, 100-120 ampere-hour. The two-wire system is used.

GENERATOR.—Generator current regulation is by an automatic field rheostat, operated by a solenoid connected in series with the charging circuit. Charging rate may be increased to meet winter driving conditions by pulling out the switch handle in the upper left-hand corner of the switch panel. Pulling out this switch short-circuits a part of the solenoid winding, retarding the action of the automatic rheostat and increasing the charging rate. Generator current output may be varied by changing the amount of bird shot in the piston of the dash pot. Maximum current output must not exceed 12 amperes.

OILING.—Pour 30 or 40 drops of light engine oil in the oil hole in the top of the generator every month. If the car is driven more than 1000 miles in a month, the oiling must be done every 1000 miles.

RELAY.—Relay closes at 8-10 miles per hour and opens at 6-8 miles per hour. Relay contacts separate 1/16 inch. The air gap between the poles, contacts closed, is .015 inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

REGULATOR, CARE.—Inspect and clean the regulator apparatus every month. Be careful not to alter the adjustment. Wipe the dash pot and piston with a cloth moistened with gasoline. Do not oil. Clean rheostat segments and spaces between them. Put one drop of light engine oil on the bearings of the pulley wheel.

FUSES.—Shunt field fuse is 5 ampere. Main circuit fuse is 15 ampere. Both are mounted in the instrument panel.

Plate No. 426

STANDARD

MODEL G (1918) H (1919) I (1920)

WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM

ATWATER KENT AND SPLITDORF IGNITION

BATTERY.—Willard, Type SJR-6, 6 volt, 160 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Aero Magneto, Type 849, and Atwater Kent, Type CC. Magneto breaker contacts separate .020 inch. When the condition of the points affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper. Battery breaker contacts separate .006 inch. They are made of tungsten. When the condition of the points affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING.—Magneto.—Put 4 drops of light engine oil in the oil cup above the distributor shaft and 2 drops in the oil cup at the drive end every month. Apply one drop of light engine oil to the bearing of the breaker bar. If the car is driven more than 1000 miles in a month, these attentions must be given every 1000 miles.

OILING.—Battery Distributor.—Remove the distributor cap every two weeks and put 4 or 5 drops of light engine oil in the oil hole exposed. Put a small amount of vaseline on the cam, applying with a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Battery breaker contacts begin to separate when the top dead center mark on the flywheel is at the indicator, and magneto breaker contacts begin to separate when the top dead center mark is one inch past the indicator for 1919 and 1920 cars assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1R, 1L, 3R, 3L, 4R, 4L, 2R, 2L.

SPARK PLUG GAPS.—Spark plug gaps are .025 inch.

STARTER.—Frame 751. Starter is connected to the engine through a Bendix drive.

Starter Data		
Torque	R.P.M.	Amperes
2.5 lb. ft.	1450	140
10.0 lb. ft.	750	340
15.0 lb. ft.	560	460
21.0 lb. ft.	Lock	650

OILING.—Put 5 or 6 drops of light engine oil in each of the starter oilers every month.

GENERATOR.—Frame 760. Generator current regulation is by third brush system. Maximum current output is 11-15 amperes, reached at 1250 R.P.M. of the armature, or 20-25 miles per hour.

Cold Test		Generator Data		Hot Test	
Amperes	R.P.M.	Amperes	R.P.M.	Amperes	R.P.M.
0	450	0	500	0	500
8	675	6	725	6	725
12	840	9	850	9	850
15	1050-1350	11	1050-1350	11	1050-1350
12	1750	8	1750	8	1750

Field current is 2.8 to 3.25 amperes at 6 volts. Operating freely as a motor, generator takes 3.5 to 5 amperes at 6 to 6.6 volts. To increase charging rate move the third brush in a counter-clockwise direction (looking at commutator end), and in a clockwise direction to decrease the charging rate.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 8-10 miles per hour, or 450-550 R.P.M. of the armature and opens at 6-8 miles per hour, or 400-450 R.P.M. of the armature. Charging current is 1 to 2 amperes at closing and the discharge current 0 to 2 amperes at the opening of relay contacts. Air gap between relay armature and coil core is .031 inch, contacts open. Contacts separate .013 to .016 inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dimmer lamps are 6-8 volt, 6 cp. Dash and tail lamps are 6-8 volt, 2 cp. Body lamp is 6-8 volt, 4 cp.

On 1918 cars, head lamps are 6-8 volt, 18 cp. Dimmer are 6-8 volt, 4 cp.

FUSES.—Fuses are 15 ampere.

Note.—On 1918 and 1919 cars only the magneto ignition was used.

Plate No. 427

PEERLESS MODEL 56 SERIES 6 (1918-19-20) REMY GENERATING, STARTING AND LIGHTING SYSTEM REMY IGNITION

BATTERY.—Battery is 6 volt, 115 ampere-hour. The negative (—) terminal is grounded () at the starting motor.

IGNITION.—Breaker contacts separate .005 to .008 inch. They are made of tungsten. When the condition of the points affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING.—Put several drops of light engine oil in the oil hole, exposed when distributor cap is removed, every two weeks. At the same time put a very small amount of vaseline on the cam, applying with a toothpick. If car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1R, 4L, 3R, 2L, 4R, 1L, 2R, 3L.

SPARK PLUG GAPS.—Spark plug gaps are .023 inch.

STARTER.—Model ME. Starter is connected to engine through a Bendix drive.

Starter Data—Model ME

Torque	R.P.M.	Amperes
1 lb. ft.	1960	80
3 lb. ft.	1100	160
5 lb. ft.	800	220
7 lb. ft.	500	280
9 lb. ft.	230	340
13 lb. ft.	Lock	470

OILING.—Starter bearings are packed with soft cup or ball bearing grease. Thoroughly clean out and repack every 6 months.

GENERATOR.—Model GH, Special type. Generator current regulation is by third brush system.

Amperes	Generator Data. Special Model GH	R.P.M.
5		770-855
10		1075-1210
12		1285-1575
12-13		1575-1625

Brush pressure on commutator is 1 to 1¼ pounds.

OILING.—Generator bearings are packed with soft cup or ball bearing grease, but should receive 2 or 3 drops of light engine oil every two weeks. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.

RELAY.—Relay closes at 8 miles per hour, or 570-600 R.P.M. of armature and opens at 6 miles per hour or 500-570 R.P.M. of armature. Charging current is .5 to 1.5 amperes at closing, and the discharge current 0 to 1 ampere at opening of relay. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 17 cp. Side lamp is 6-8 volt, 5 cp. Spot lamp is 6-8 volt, 5 cp. Dash lamp is 6-8 volt, 2 cp. Tail lamp is 6-8 volt, 2 cp.

FUSES.—Lighting fuses are 10 ampere.

GRANT

MODEL H (1920) (SERIAL NOS. UNDER 2030) WAGNER GENERATING, STARTING AND LIGHTING SYSTEM ATWATER KENT IGNITION

BATTERY.—Prest-O-Lite, 6 volt, 105 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Type CC. Breaker contacts separate .006 inch. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel.

OILING.—Put 4 or 5 drops of light engine oil in the breaker unit oiler every two weeks. Put a small amount of vaseline on the cam, applying with a toothpick. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

TIMING.—Breaker contacts begin to separate when piston entering power stroke is on top dead center, spark control and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .025 to .028 inch.

STARTER.—E.M.-298, 36-T. Starter is connected to the engine through a Bendix drive. Starter cranks the engine at 115 R.P.M., current 160 amperes. Running freely, starter armature revolves at 8000 R.P.M., current 60-90 amperes. Lock torque is 11.5 pound-feet, current 475 amperes.

OILING.—Put 5 or 6 drops of light engine oil in each of the starter oilers every month.

GENERATOR.—E.M.-303, 45-W. Generator current regulation is by third brush system. Maximum current output is 16 amperes, reached at 1500 R.P.M. of the armature or 20-24 miles per hour.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 8-10 miles per hour or 585-730 R.P.M. of the armature, and opens at 6-8 miles per hour or 437-585 R.P.M. of the armature. Charging current is 2 amperes at closing and the discharge current 0-4 amperes at the opening of relay contacts. Relay contacts separate .035 to .065 inch. Air gap between relay armature (moving member) and coil core is .025 inch, contacts closed. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 15 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp.

FUSES.—Fuse is 15 ampere.

BIJUR GENERATING, STARTING AND LIGHTING SYSTEM
BOSCH IGNITION

BATTERY.—Columbia, 6 volt, 90 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Breaker contacts separate .014 to .016 inch. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Put 2 or 3 drops of light machine oil in each of the magneto oilers every month. Put a small amount of vaseline on the fiber bumper of the contact arm, applying with a toothpick. If the car is driven more than 1000 miles in a month, these attentions must be given every 1000 miles.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .025 inch.

STARTER.—E.D.-160, M-979. Rotation is counter-clockwise, looking at commutator end. Starter is connected to the engine through a Bendix drive. Lock torque is 16.5 pound-feet, current being 665 amperes at 3.6 volts. Running freely, armature revolves at 6800 R.P.M., taking 30 amperes. Pressure of brushes on commutator is 25 ounces.

OILING.—Put several drops of light engine oil in each of the starter bearings every month.

GENERATOR.—Type L-61, M-1204. Rotation is counter-clockwise, looking at commutator end. Generator current regulation is by third brush system. Maximum current output is 15 amperes, reached at 20 miles per hour or 1400 R.P.M. of the armature. Charging rate is varied by inserting a special toothed wrench in the adjusting hole in the commutator end plate and shifting the third brush assembly through a ratchet engagement. Turn the adjusting wrench to the right (facing commutator end) to increase the charging rate. Maximum current output must not exceed 15 amperes at 1400-1600 R.P.M. Pressure of brushes on commutator is 14 ounces. There is a 10 ampere fuse mounted on the generator frame to protect the field winding should excessively high resistance occur in the charging circuit.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 8-9 miles per hour or 550-600 R.P.M. of the armature and opens at 7-8 miles per hour or 500-550 R.P.M. of the armature. Relay contacts separate .045 inch. Air gap between relay armature (moving member) and coil core is .035 inch, contacts closed. To adjust relay, connect a voltmeter across the main brushes of the generator. Then insert a special wrench in the small adjusting hole in the commutator end plate and adjust relay spring tension until the contacts close when the voltage reaches 6.5 volts. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 15 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash lamp is 6-8 volt, 2 cp. Tail lamp is 6-8 volt, 2 cp.

GRAY AND DAVIS GENERATING, STARTING AND LIGHTING SYSTEM
ATWATER KENT IGNITION

BATTERY.—Willard, 6 volt, 108.5 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Type CC. Breaker contacts separate .006 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

SPRK PLUG GAPS.—Spark plug gaps are .025 inch.

STARTER.—Model No. 502 or 700. Starter is connected to the engine through a Bendix drive. Starter cranks the engine at 120 R.P.M., taking 125 amperes. Lock torque is 12 pound-feet, current being 450 amperes.

OILING.—Put 5 or 6 drops of light engine oil in each of the starter oilers every month.

OILING.—Remove the distributor cap every two weeks and put 4 or 5 drops of light engine oil in the oil hole exposed. Put a small amount of vaseline on the cam, applying with a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when the flywheel marking "T.C. 1-6" is $1\frac{1}{4}$ inches past the indicator, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 2, 6, 2, 4.

GENERATOR.—Model No. 605 or 606. Generator current regulation is by third brush system. Maximum current output is 12-18 amperes, reached at 10-12 miles per hour. Charging rate is varied by adjusting the third brush setting. Adjustment is made by turning the pinion screw located at the bottom of the rear cover plate, between the fuse and the relay. Turn this screw to the right to increase the charging rate, and to the left to decrease the charging rate.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted on generator frame. Relay closes at 8-10 miles per hour or 500-550 R.P.M. of the armature, and opens at 6-8 miles per hour, or 450-500 R.P.M. of the armature. Charging current is 1-3 amperes at closing, and the discharge current 0-2 amperes at opening of relay contacts. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 17 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp.

FUSES.—Generator fuse is 5 ampere.

MODEL 6-80 (1919-20)

WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM BOSCH MAGNETO IGNITION

BATTERY.—Willard, 6 volt, 115 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Breaker contacts separate .014 to .016 inch. When the condition of the points affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Put 3 or 4 drops of light engine oil in each of the magneto oilers every month. Put a very small amount of vaseline on the fiber bumper of the contact arm, applying with a toothpick. If the car is driven more than 1000 miles in a month, these attentions must be given every 1000 miles.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .018 to .023 inch.

STARTER.—Frame No. 751. Starter is connected to the engine through a Bendix drive.

Starter Data		
Torque	R.P.M.	Amperes
2.5 lb. ft.	1450	140
7.5 lb. ft.	1150	200
12.5 lb. ft.	650	400
17.5 lb. ft.	500	530
21.0 lb. ft.	Lock	650

OILING.—Put 5 or 6 drops of light engine oil in each of the starter oilers every month.

GENERATOR.—Frame No. 760. Generator current regulation is by the third brush system. Maximum current output is 15-17 amperes, reached at 1250 R.P.M. of the armature or 16-20 miles per hour.

Generator Data					
Amperes	Cold Test	R.P.M.	Amperes	Hot Test	R.P.M.
0		450	0		500
8		675	6		725
12		840	9		850
15-17		1250	12-14		1250
10		2000	7-8		2000

The cold test readings are obtained with a generator temperature under 95°F. The hot test readings are obtained after the generator has been operated one hour at 1800 R.P.M., charging a half-charged battery. Shunt field current is 2.8 to 3.25 amperes when 6 volts pressure is applied to its terminals. When the generator is operating freely as a motor, current is 3.5 to 5 amperes at 6 to 6.6 volts.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted in the generator frame. Relay closes at 500-550 R.P.M. of the armature or 7-9 miles per hour and opens at 450-500 R.P.M. of the armature or 5-7 miles per hour. Adjust the spring tension on the relay armature so that the contacts open with a discharge current of 0-3 amperes. Adjust the air gap between the relay 68 ohms. Clean relay contacts by drawing unglazed paper between them. If badly armature and coil core so that the contacts close when the voltage of the generator reaches 6.2 to 6.5 volts. Air gap between relay armature and coil core is .005 inch. contacts closed. Contacts separate .030 to .035 inch. Resistance of the shunt coil burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 15 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash lamps are 6-8 volts, 2 cp. Tonneau lamp is 6-8 volt, 2 cp. Inspection or trouble lamp is 6-8 volt, 2 cp. Tail lamp is 6-8 volt, 2 cp.

FUSES.—Fuses are 15 ampere.

Plate No. 432

DORT MODELS 11 (1919) AND 15 (1920) SERIAL NOS. 24369 UP. WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM CONNECTICUT IGNITION

BATTERY.—Willard, Type S.J.W.-3, 6 volt, 95 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Breaker contacts separate .025 inch. They are made of tungsten. When the condition of the points affects the ignition, renew the inner breaker mechanism. For temporary service, resurface contacts with fine emery cloth.

OILING.—Refill the cup under the breaker head with pure vaseline and turn down every month. If car is driven more than 1000 miles in a month, this must be done every 1000 miles. Do not put grease or oil in the cup.

TIMING.—Breaker contacts begin to separate when top dead center mark on flywheel is 1 inch past indicator, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 3, 4, 2.

SPARK PLUG GAPS.—Spark plug gaps are .030 inch.

STARTER.—Frame 100. Starter is connected to the engine through a Bendix drive. Starter cranks the engine at 140 R.P.M., current being 250 amperes. Running freely, armature revolves at 4000 R.P.M., current 50 amperes. Lock torque is 12 pound-feet, current 475 amperes at 4 volts. Torque at 1600 R.P.M. is 1 3/4 pound-feet.

OILING.—Put 4 or 5 drops of light engine oil in each of starter bearing oilers every month.

GENERATOR.—Frame No. 760. Generator current regulation is by third brush system. Current output is varied by adjustment of third brush setting. Set the third brush so that at 1100-1500 R.P.M. the maximum current output is 15 to 17 amperes, at 7 1/2 volts. The cold test readings are obtained with the normal setting of third brush, and a generator temperature under 35°C. (95°F.). The hot test readings are obtained after the generator has been operated one hour at 1800 R.P.M., charging a half-charged battery or its equivalent.

Generator Data		
Cold Test		
R.P.M.	Generator Output Amperes	Generator Voltage
500	0	6.5
750	8	6.5
1250	15-17	7.5
2500	7-11	6.5-7.5

Hot Test		
R.P.M.	Generator Output Amperes	Generator Voltage
1250	12-14	7.5
2500	7-11	6.5-7.5

Field current is 2.8 to 3.25 amperes, 6 volts. Field resistance is 1.9 to 2.25 ohms at 25°C. (77°F.).

Field Test, Generator Operating			
Cold Test			
R.P.M.	Generator Output Amperes	Generator Voltage	Field Current
1250	15-17	7.5	1.5-2.4
Hot Test			
R.P.M.	Generator Output Amperes	Generator Voltage	Field Current
1250	12-15	7.5	1.5-2.2

Operating freely as a motor, current flow is 3.5 to 5 amperes, 6 to 6.6 volts.

OILING.—Put 5 or 6 drops of light engine oil in each of generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 8-10 miles per hour or 500-550 R.P.M. of armature, and opens at 6-8 miles per hour, or 450-500 R.P.M. of armature. Charging current is 1 to 2 amperes at closing, and the discharge current 0 to 2 amperes at opening of relay. Air gap between relay armature (moving member) and coil core is .031 inch, contacts separated. Contacts separate .013 to .018 inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 16 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and

DIXIE FLYER

MODEL H, SERIES 5000 AND 7000 (1920)

DYNETO GENERATING, STARTING AND LIGHTING SYSTEM CONNECTICUT IGNITION

BATTERY.—Willard, 6 volt, 80 ampere-hour. The two-wire system is used.

IGNITION.—Breaker contacts separate .018 to .020 inch. They are made of tungsten. When the condition of the points affects the ignition, renew the inner breaker mechanism. For temporary service, resurface contacts with fine emery cloth.

OILING.—Refill the cup under the breaker head with pure vaseline and turn down every month. If the car is driven more than 1000 miles in a month, this must be done every 1000 miles. Do not put grease or oil in the cup.

TIMING.—Breaker contacts begin to separate when piston entering power stroke is on top dead center, spark control lever in a horizontal position. (First see that the breaker assembly is fully retarded when the control lever is in the fully retarded position.)

FIRING ORDER.—The firing order is 1, 3, 4, 2.

SPARK PLUG GAPS.—Spark plug gaps are .030 inch.

STARTER.—Model No. D69-D284. Starter is connected to the engine through a Bendix drive.

Starter Data

Torque	R.P.M.	Amperes	Volts
0.0 lb. ft.	5600	25	6.4
2.5 lb. ft.	1400	150	5.8
5.0 lb. ft.	850	250	5.3
10.0 lb. ft.	250	420	4.6
14.0 lb. ft.	Lock	530	4.0

OILING.—Put several drops of light engine oil in starter oilers every month.

GENERATOR.—Model No. C69-C284. Generator current regulation is by the third brush system. Maximum current output of 14 amperes is reached at 16-18 miles per hour or 1500 R.P.M. of armature.

Generator Data

Amperes	M.P.H.	Volts
0	7-9	6.4
5	9-10	6.6
10	12-14	6.8
12-14	16-18	7.8
8	40-45	6.7

Charging rate may be varied by adjusting the third brush setting. Shunt field current is 3.5 amperes at 6.5 volts.

OILING.—Put 4 or 5 drops of light engine oil in the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 8-10 miles per hour or 450-500 R.P.M. of armature, and opens at 6-8 miles per hour or 400-450 R.P.M. of armature. Relay contacts separate $\frac{3}{32}$ inch. Air gap between relay armature and coil core is $\frac{1}{8}$ inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 15 cp. Dash and tail lamps are in series and are each 3-4 volt, 2 cp.

Plate No. 434

ESSEX

MODEL A (1920)

DELCO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

BATTERY.—Exide, XC15-1, 6 volt, 105 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Coil No. Model 2177. Distributor Model No. 5205. Breaker contacts separate .018 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING.—Put 2 or 3 drops of light engine oil in the upper ball bearing of the distributor shaft every two weeks. If the track of the rotor button in the distributor shaft is not well polished, apply a small amount of vaseline with a soft cloth. Clean out and repack the distributor housing with soft cup grease every six months.

TIMING.—Breaker contacts begin to separate when the flywheel marking "DC 1 & 4" is at the indicator, spark control lever and breaker assembly in the fully advanced position.

FIRING ORDER.—The firing order is 1, 3, 4, 2.

SPARK PLUG GAPS.—Spark plug gaps are .030 inch.

STARTER.—Model No. 161. Starter is connected to the engine through a Bendix drive. The raising and lowering of the two grounded starter brushes serves as a starting switch. Starter cranks the engine at 120 R.P.M., taking 150 amperes. Lock torque is 10.4 pound-feet, current being 780 amperes at 2.86 volts.

OILING.—Put 4 or 5 drops of light engine oil in the oiler at the commutator end and 8 to 10 drops in the oiler at the opposite end every two weeks.

GENERATOR.—Model No. 166. Generator current regulation is by third brush system. Maximum current output is 12-16 amperes, reached at 20 miles per hour or 1400 R.P.M. of the armature. Generator begins to supply current at 7 miles per hour.

Amperes	Generator Data	R.P.M.
2		600
12-16		1400
12-16		1600
8		2400

Charging rate is varied by adjusting the third brush setting. To move the third brush, loosen the three screws which hold the bearing retainer plate in place on the commutator end. Move the third brush holder in a counter-clockwise direction (looking at the commutator end) to increase the charging rate, and in a clockwise direction to decrease the charging rate. Tighten the holding screws and reseal the brush after adjusting position.

OILING.—Put 4 or 5 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—There is no relay. The circuit between the generator and the battery is controlled by the ignition switch.

LAMPS.—Head lamps are 6-8 volt, 15 cp. Dash and tail lamps are 3-4 volt, 2 cp.

CIRCUIT-BREAKER.—A vibrating circuit-breaker takes the place of fuses. It requires a current of 25 amperes to start the vibrator, but 3-5 amperes will cause it to continue.

Plate No. 435

MOON MODEL 6-48 (1920) DELCO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

BATTERY.—Exide, Type 3X-15-1, 6 volt, 120 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 2159. Distributor Model No. 5157. Breaker contacts separate .018 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING.—Put 3 or 4 drops of light engine oil in the distributor shaft bearing every two weeks. If the track of the rotor button is not well polished, apply a small amount of vaseline with a soft cloth. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .030 inch.

STARTER.—Model No. 136. Starter is connected to the engine through a Bendix drive. Running freely, starter current is 35 amperes at 3.5 volts, armature revolving at 4500 R.P.M.

OILING.—Starter bearings are of the oilless type.

GENERATOR.—Model No. 135. Generator current regulation is by the third brush system. Generator begins to supply current at 7-9 miles per hour or 500-550 R.P.M. of the armature and reaches the maximum current output of 16 amperes at 1400 R.P.M. of the armature or 18-24 miles per hour.

Cold Test		Generator Data		Hot Test	
Amperes	R.P.M.			Amperes	R.P.M.
Neutral	500			Neutral	500
10.5-12.5	900			10-12	900
15.5-18.0	1400			14-16	1400
13.0-17.0	2000			11-13	2000

Charging rate is varied by adjusting the third brush setting. Loosen the two screws holding the third brush arm, and move the arm in a counter-clockwise direction (looking at the commutator end) to increase the charging rate. Move the arm in the opposite direction to decrease the charging rate. Tighten the two screws and reseal the brush after adjusting position.

RELAY.—There is no relay. The circuit between the generator and battery is controlled by the ignition switch.

LAMPS.—Head lamps are 6-8 volt, 20 cp. Dash and tail lamps are 6-8 volt, 2 cp.

CIRCUIT-BREAKER.—A vibrating circuit-breaker takes the place of fuses. It requires a current of 25 amperes to start the vibrator, but 3-5 amperes will cause it to continue.

PILOT

MODEL 6-45 (1920)

DELCO GENERATING, STARTING AND LIGHTING SYSTEM

DELCO IGNITION

BATTERY.—Battery is 6 volt, 80 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 2158. Breaker contacts separate .018 to .020 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING.—Put 3 or 4 drops of light engine oil in the distributor shaft bearing every two weeks. If the track of the rotor button in the distributor head is not well polished, apply a small amount of vaseline with a soft cloth. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when the piston entering the power stroke is on top dead center, spark control lever and breaker assembly advanced one-third

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .030 inch.

STARTER.—Model No. 104. Starter is connected to the engine through a Bendix drive. Lock torque is 16 pound-feet, at 3.5 to 3.8 volts. Running freely, starter takes 40 amperes.

OILING.—Put several drops of light engine oil in the starter oilers on Model 86. Model 104 is of the oilless type.

GENERATOR.—Model No. 103. Generator current regulation is by third brush system. Generator begins to supply current at 500 R.P.M. of the armature or 8 miles per hour and reaches the maximum current output of 16 amperes at 1400 R.P.M. of the armature or 22 miles per hour.

Generator Data

Amperes	R.P.M.	Amperes	R.P.M.
Neutral	500	Neutral	500
10.5-12.5	900	10-12	900
15.5-18.0	1400	14-16	1400
13.0-17.0	2000	11-13	2000

Charging rate is varied by adjusting third brush setting. Loosen the two screws holding the third brush arm, and move the brush in a counter-clockwise direction (looking at commutator end) to increase the charging rate. Move the brush in a clockwise direction to decrease the charging rate. Tighten the holding screws and reseat brush after adjusting position.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—There is no relay. The circuit between the generator and the battery is controlled by the ignition switch.

LAMPS.—Head lamps are 6-8 volt, 15 cp. Dash and tail lamps are connected in series and are each 3-4 volt, 2 cp.

CIRCUIT-BREAKER.—A vibrating circuit-breaker takes the place of fuses. It requires 25 amperes to start the vibrator, but 3-5 amperes will cause it to continue.

Plate No. 437

PREMIER **MODEL 6-D (1920)** **DELCO GENERATING, STARTING AND LIGHTING SYSTEM** **DELCO IGNITION**

BATTERY.—Willard, Type SJRN-4, 6 volt, 120 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 2145. Breaker contacts separate .018-.020 inch. They are made of tungsten. When the condition of the points affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel.

OILING.—Put 4 or 5 drops of light engine oil in the distributor shaft bearing every two weeks. If the track of the rotor button is not well polished, apply a small amount of vaseline with a soft cloth. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when the top dead center mark on the flywheel is $1\frac{1}{2}$ inches past the indicator, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .025 inch.

STARTER.—Model No. 110. Starter is connected to the engine through a Bendix drive. Starter cranks the engine at 125 R.P.M., with a current of 125-175 amperes. Running freely, armature revolves at 2000 R.P.M., current 50 amperes. Lock torque is 16 pound-feet, current 450 amperes at 3.4 volts.

OILING.—Put 3 or 4 drops of light engine oil in starter bearings every month.

GENERATOR.—Model No. 118. Generator current regulation is by third brush system. Generator begins to supply current at 500 R.P.M. of the armature or 8 miles per hour, and reaches its maximum current output at 1400 R.P.M. of armature or 20-25 miles per hour.

Cold Test		Generator Data		Hot Test	
Amperes	R.P.M.			Amperes	R.P.M.
Neutral	500			Neutral	500
10.5	900			10	900
15.5-18	1400			14-16	1400
13.0-17	2000			11-13	2000

To adjust the third brush position, loosen the two screws in the third brush arm. Move the brush in a clockwise direction (looking at commutator end) to increase the charging rate, and in a counter-clockwise direction to decrease the charging rate. Tighten the two screws and reseal the third brush after adjusting position.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—There is no relay. The circuit between the generator and battery is controlled by the ignition switch.

LAMPS.—Head lamps are 6-8 volt, 20 cp. Dimmer lamps are 6-8 volt, 12 cp. Dash lamp is 6-8 volt, 2 cp. Tail lamp is 6-8 volt, 2 cp. Rear-quarter lamps are 6-8 volt, 2 cp. Spot lamp is 6-8 volt, 20 cp. Tonneau lamp is 6-8 volt, 2 cp.

CIRCUIT-BREAKER.—A vibrating circuit breaker takes the place of fuses. It requires a current of 25 amperes to start this device vibrating. While vibrating, the current is 3-5 amperes.

CLEVELAND

MODEL 40 (1920)

GRAY AND DAVIS GENERATING, STARTING AND LIGHTING SYSTEM

GRAY AND DAVIS IGNITION

BATTERY.—Prest-O-Lite, 6 volt, 94 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Breaker contacts separate .015 inch. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING.—Put 4 or 5 drops of light engine oil in the distributor bearing oil cup every two weeks. Put a small amount of vaseline on the cam, applying with a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when the flywheel marking "DC 1 & 6" is opposite the mark on the hole in the flywheel housing, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .030 inch.

STARTER.—Model No. 500. Starter is connected to the engine through a Bendix drive. Starter cranks the engine at 80 R.P.M., taking 150 amperes. Running freely starter current is 45-50 amperes. Lock torque is 15 pound-feet.

OILING.—Put 5 or 6 drops of light engine oil in each of the starter bearing oilers every month.

GENERATOR.—Model No. 604. Generator current regulation is by third brush system. The maximum charging rate is 15 amperes, reached at 1400 R.P.M. of the armature or 25 miles per hour. Shunt field current is 2.5 amperes at 6.5 volts. Charging rate is varied by adjusting the third brush setting. Turn the adjusting screw at the commutator end to the right to increase the charging rate and to the left to decrease the charging rate.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted on the generator frame. Relay closes at 7-9 miles per hour and opens at 5-7 miles per hour. Contacts separate .012 to .015 inch. Air gap between relay armature and coil core is .018 inch. Charging current is 1-2 amperes at closing, and the discharge current 0-2 amperes at opening of relay. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 15 cp. Dash and tail lamps are 6-8 volt, 2 cp.

Plate No. 439

CLEVELAND

MODEL 40 (1920)

GRAY AND DAVIS GENERATING, STARTING AND LIGHTING SYSTEM BOSCH IGNITION

BATTERY.—Prest-O-Lite, 6 volt, 94 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Bosch, Type B-6. Breaker contacts separate .014-.016 inch. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Put 2 or 3 drops of light engine oil in each of the magneto oilers every two weeks. Put a small amount of vaseline on the fiber bumper of the contact arm, applying with a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when the flywheel marking "DC 1 & 6" is opposite the mark on the hole in the flywheel housing, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .026 inch.

STARTER.—Model No. 500. Starter is connected to the engine through a Bendix drive. Starter cranks the engine at 80 R.P.M., taking 150 amperes. Running freely starter current is 45-50 amperes. Lock torque is 15 pound-feet.

OILING.—Put 5 or 6 drops of light engine oil in each of the starter bearing oilers every month.

GENERATOR.—Model No. 604. Generator current regulation is by third brush system. The maximum charging rate is 15 amperes, reached at 1400 R.P.M. of the armature or 25 miles per hour. Shunt field current is 2.5 amperes at 6.5 volts. Charging rate is varied by adjusting third brush setting. Turn the adjusting screw at the commutator end to the right to increase the charging rate and to the left to decrease the charging rate.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted on the generator frame. Relay closes at 7-9 miles per hour and opens at 5-7 miles per hour. Contacts separate .012 to .015 inch. Air gap between relay armature and coil core is .018 inch. Charging current is 1-2 amperes at closing, and the discharge current 0-2 amperes at opening of relay. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 15 cp. Dash and tail lamps are 6-8 volt, 2 cp.

Plate No. 440

MOON VICTORY MODEL (1920) WAGNER GENERATING, STARTING AND LIGHTING SYSTEM WAGNER IGNITION

BATTERY.—Exide, Type 3-X-15-1, 6 volt, 120 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Coil Model K-32.....Distributor Model KC-335. Breaker contacts separate .024 to .029 inch. When the condition of the contacts affects the ignition, renew the lever arm and contact screw.

OILING.—Screw the grease cup under the breaker head one-half turn every two weeks. If the car is driven more than 500 miles in two weeks, this must be done every 500 miles. Put 3 or 4 drops of light engine oil on the wick in the breaker lever spindle every 6 months.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .025 to .028 inch.

STARTER.—Model E.M.-272, Type 36-T. Starter is connected to the engine through a Bendix drive. Starter cranks the engine at 110 R.P.M., current 160 amperes. Lock torque is 11.5 pound-feet, current 475 amperes. Running freely, starter current is 60-90 amperes, armature revolving at 8000 R.P.M.

OILING.—Put 5 or 6 drops of light engine oil in each of the starter oilers every month.

GENERATOR.—Model E.M.-303, Type 45-W. Generator current regulation is by third brush system. Maximum current output is 16 amperes, reached at 20-24 miles per hour, or 1500 R.P.M. of the armature.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks the oiling must be done every 500 miles.

RELAY.—Relay closes at 8-10 miles per hour or 587-735 R.P.M. of the armature, and opens at 6-8 miles per hour or 440-587 R.P.M. of the armature. Charging current is 2 amperes at closing, and the discharge current 0-4 amperes at opening of relay contacts. Contacts separate .035 to .065 inch. Air gap between relay armature (moving member) and coil core is .025 inch, contacts closed. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 20 cp. Dash lamp is 6-8 volt, 2 cp. Tail lamp is 6-8 volt. 2 cp.

ALLEN

MODEL 43 (1920)

AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM CONNECTICUT IGNITION

BATTERY.—U. S. L., Type HDN-311X, 6 volt, 80 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Breaker contacts separate .020 inch. When the condition of the contacts affects the ignition, renew the inner breaker mechanism. For temporary service, resurface contacts with fine emery cloth.

OILING.—Refill the cup under the breaker head with pure vaseline and turn down every month. If the car is driven more than 1000 miles in a month, this must be done every 1000 miles. Do not put grease or oil in the cup.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 2, 4, 3.

SPARK PLUG GAPS.—Spark plug gaps are .025 inch.

STARTER.—Model MG-1015. Starter is connected to the engine through a Bendix drive. Starter cranks the engine at 96 R.P.M., taking 175 amperes.

Starter Data

Torque	R.P.M.	Amperes
2 lb. ft.	1280	135
4 lb. ft.	900	210
6 lb. ft.	600	275
8 lb. ft.	400	335
10 lb. ft.	180	390
13 lb. ft.	Lock	500

OILING.—Put 4 or 5 drops of light engine oil in each of the starter bearing oilers every month.

GENERATOR.—Model GJ-1024. Generator current regulation is by third brush system. Maximum current output is 12-16 amperes, reached at 1700 R.P.M. of the armature or 22 miles per hour.

Cold Test		Generator Data		Hot Test	
Amperes	R.P.M.	Amperes	R.P.M.	Amperes	R.P.M.
0	500	0	460		
8	750	6	840		
12	960	9	1050		
16	1400	12	1360		
16.5	1700	12.7	1700		
12	3400	10	3400		

Above readings are obtained with generator charging a battery of 1300 solution.

OILING.—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 9 miles per hour or 580 R.P.M. of armature and opens at 7 miles per hour or 360 R.P.M. of armature. Relay contacts separate .030 to .045 inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 18 cp. Dimmer lamps are 6-8 volt, 5 cp. Dash and tail lamps are 6-8 volt, 2 cp.

FUSES.—Fuses are 15 ampere.

Plate No. 442

STUDEBAKER

SERIES 20, MODELS EH AND EG (1920) SERIAL NOS. 257,465 UP

WAGNER GENERATING, STARTING AND LIGHTING SYSTEM

WAGNER IGNITION

BATTERY.—Willard, Type SJR-4, 6 volt, 115 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Coil Model K-43. Distributor Model KC-666. Breaker contacts separate .024 to .029 inch. They are made of tungsten. When the condition of the contacts affects the ignition, renew the contact screw and lever arm.

OILING.—Screw up the grease cup under the breaker head one-half turn every two weeks. If the car is driven more than 500 miles in two weeks, this must be done every 500 miles. Put 3 or 4 drops of light engine oil in the wick in the breaker lever spindle every six months.

TIMING.—Breaker contacts begin to separate when the flywheel marking "AD-SP" is at the indicator, spark control lever and breaker assembly in the fully advanced position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .025 to .028 inch.

STARTER.—Model EM-201, Type 36-T. Starter is connected to the engine through a chain drive an overrunning clutch. Starter cranks the engine at 110 R.P.M., taking 160 amperes. Lock torque is 35 pound-feet, current being 475 amperes. Running freely, starter takes 60-90 amperes, armature revolving at 9000 R.P.M.

OILING.—Put 5 or 6 drops of light engine oil in the starter oilers every month.

GENERATOR.—Model EM-214 or EM-326, Type 45-W. Generator current regulation is by the third brush system. Maximum current output is 16-18 amperes, reached at 1500 R.P.M. of the armature or 20-22 miles per hour.

Amperes	Generator Data	R.P.M.
0		650
4		740
8		850
12		980
16-18		1400
10		2200

Charging rate is varied by adjusting third brush setting. Move the third brush in the direction of armature rotation to increase the charging rate, and against the direction of rotation to decrease the charging rate. Reseat the brush after adjusting position.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Type K-44 or I-471. Relay closes at 8-10 miles per hour or 600-700 R.P.M. of the armature and opens at 6-8 miles per hour or 500-560 R.P.M. of the armature. Charging current is 2 amperes at closing and the discharge current 0-4 amperes at the opening of relay contacts. Contacts of the Type K-44 relay separate .031 inch, and the air gap between relay armature and coil core is .031 inch, contacts closed. Contacts of the Type L-471 relay separate .035 to .065 inch, and the air gap between relay armature and coil core is .025 inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 15 cp. Dash, tail and tonneau lamps are 6-8 volt, 2 cp. Side lamps are 6-8 volt, 4 cp.

FUSES.—Fuses are 10 ampere.

HUFFMAN **MODEL R (1920). SERIAL NOS. 1776 UP** **DYNETO GENERATING, STARTING AND LIGHTING SYSTEM** **CONNECTICUT IGNITION**

Plate No. 443

BATTERY.—Willard, Type SJWN-3, 6 volt, 80 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Breaker contacts separate .018 to .024 inch. They are made of tungsten. When the condition of the contacts affects the ignition, renew the inner breaker mechanism. For temporary service resurface contacts with fine emery cloth.

OILING.—Refill the grease cup under the breaker head and turn down every month. If the car is driven more than 1000 miles in a month, this must be done every 1000 miles. Do not put grease or oil in the cup.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .030 inch.

STARTER.—Model No. D-288. Starter is connected to the engine through a Bendix drive. When cranking engine, starter takes 130 amperes, armature revolving at 1500 R.P.M.

Starter Data

Torque	R.P.M.	Amperes	Volts
0.0 lb. ft.	5600	25	6.4
2.5 lb. ft.	1400	150	5.8
10.0 lb. ft.	250	420	4.6
5.0 lb. ft.	850	250	5.3
14.0 lb. ft.	Lock	530	4.0

OILING.—Put several drops of light engine oil in starter oilers every month.

GENERATOR.—Model No. C-288. Generator current regulation is by third brush system. Maximum current output is 12-15 amperes, reached at 1200 R.P.M. of the armature or 20-25 miles per hour.

Generator Data

Amperes	Cold Test	R.P.M.	Amperes	Hot Test	R.P.M.
6		600	5		600
13		900	10		900
15		1200	12		1200
13.5		1600	11.5		1600
11.5		2000	10		2000

Shunt field current is 3.5 amperes at 6.5 volts. Charging rate is varied by adjustment of the third brush setting. Remove the leather plug in the commutator end of the generator, loosen the screw exposed and move in the direction of armature rotation to increase the charging rate. Move in the opposite direction to decrease the charging rate. Tighten the adjusting screw and replace the leather plug after adjustment is made.

OILING.—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 8-10 miles per hour or 450-500 R.P.M. of armature, and opens at 6-8 miles per hour or 400-450 R.P.M. of armature. Relay contacts separate 3/32 inch. Air gap between relay armature and coil core is 1/8 inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 18 cp. Dimmer lamps are 6-8 volt, 4 cp. Tail lamp is 6-8 volt, 4 cp. Dash lamp is 6-8 volt, 2 cp.

Plate No. 444

OVERLAND

MODEL 4 (1920-21)

AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM CONNECTICUT IGNITION

BATTERY.—U. S. L., Type CDN-311-X, 6 volt. The negative (—) terminal is grounded. Starting capacity—90 amperes for 20 minutes. Lighting capacity—5 amperes for 17 hours.

IGNITION.—Breaker contacts separate .016-.018 inch. When the condition of the points affects the ignition, renew the inner breaker mechanism. For temporary service, resurface contacts with fine emery cloth.

OILING.—Refill the cup under the breaker head with pure vaseline and turn down every month. If the car is driven more than 1000 miles in a month, this must be done every 1000 miles.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 3, 4, 2.

SPARK PLUG GAPS.—Spark plug gaps are .030 inch.

STARTER.—Model MG-1001. Starter is connected to the engine through a Bendix drive.

Starter Data		
Torque	R.P.M.	Amperes
2 lb. ft.	1280	135
4 lb. ft.	900	210
6 lb. ft.	600	275
8 lb. ft.	400	335
10 lb. ft.	180	390
12 lb. ft.	Lock	500

OILING.—The drive end bearing is lubricated by splash, and the commutator end bearing is of the oilless type.

GENERATOR.—Model GK-1001. Generator current regulation is by third brush system. Maximum current output is 16 amperes, reached at 1200-1400 R.P.M. of the armature or 22-24 miles per hour.

Cold Test		Generator Data		Hot Test	
Amperes	R.P.M.	Amperes	R.P.M.	Amperes	R.P.M.
0	350	0	420		
4	420	4	540		
8	540	8	700		
12	710	12	1000		
16	1200-1400	13	1200-1400		
11	2800	9.4	2800		

Above readings are obtained with a battery solution of 1.300.

OILING.—Put 4 or 5 drops of light engine oil in the rear generator bearing oiler every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 7-8 miles per hour or 350-450 R.P.M. of the armature and opens at 5-6 miles per hour or 300-400 R.P.M. of the armature. Charging current is .5 to 1.5 amperes at closing, and the discharge current 0-1 ampere at the opening of relay contacts. Contacts separate .030 to .045 inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 16 cp. Dash and tail lamps are 6-8 volt, 2 cp.

FUSES.—Fuses are 20 ampere.

(1919-20) 7-W CONTINENTAL ENGINE
AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM
ATWATER KENT IGNITION

BATTERY.—Prest-O-Lite, Type RHN-611, 6 volt, 120 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Type CC. Breaker contacts separate .005 to .008 inch. They are made of tungsten. When the condition of the points affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING.—Every two weeks remove the distributor head and put several drops of light engine oil in the oil hole exposed. Put a very small amount of vaseline on the cam, applying with a toothpick. If car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .030 inch.

STARTER.—Model MG-1016. Starter is connected to the engine through a Bendix drive.

Starter Data		
Torque	R.P.M.	Amperes
2 lb. ft.	1300	160
4 lb. ft.	900	200
6 lb. ft.	600	275
8 lb. ft.	400	340
10 lb. ft.	175	400
12 lb. ft.	Lock	450

OILING.—Put 4 or 5 drops of light engine oil in each of starter bearing oilers every month.

GENERATOR.—Model GJ-1025A. Generator current regulation is by the third brush system.

Generator Data			
Charging battery of 1300 Spec. Gravity.			
Cold Test		Hot Test	
Generator Temperature 77°F.		Generator Temperature 165°F.	
Amperes	R.P.M.	Amperes	R.P.M.

4.0	600	4.0	730
8.0	750	6.0	850
12.0	950	8.0	950
16.0	1400	12.0	1350
16.5	1600	12.6	1700
15.0	2400	11.6	2400
13.0	3000	10.6	3000

Maximum charging rate is reached at 20-25 miles per hour or 1600-1700 R.P.M. of the armature.

OILING.—Put 4 or 5 drops of light engine oil in each of generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks the oiling must be done every 500 miles.

RELAY.—Relay closes at 6-9 miles per hour and opens at 4-7 miles per hour. Charging current is 1-3 amperes at closing, and discharge current .5 to 1.5 amperes at opening of relay contacts. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volts, 15 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp.

Plate No. 446

JORDAN

SERIES M (1920). SERIAL NOS. 10,001 UP DELCO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

BATTERY.—Willard, Type SJW-B, 6 volt, 94 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 2159. Distributor Model No. 5207. Breaker contacts separate .020 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING.—Put 4 or 5 drops of light engine oil in each of the ignition unit oilers every two weeks. If the track of the rotor button in the distributor head is not well polished, apply a small amount of vaseline with a soft cloth. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when the top dead center mark on the fly-wheel is $2\frac{1}{4}$ inches past the indicator, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .025 to .030 inch.

STARTER.—Model No. 164. Starter is connected to the engine through a set of reduction gears and a Bendix drive. Starter cranks the engine at 125 R.P.M., taking 180 amperes. Lock torque is 7 pound-feet.

OILING.—Put 5 or 6 drops of light engine oil in each of the starter bearing oilers every month. Remove the grease plug in the reduction gear case and inject soft cup grease every six months.

GENERATOR.—Model No. 165. Rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. Maximum charging rate is 11-15 amperes, reached at 1200 R.P.M. of the armature or 16-20 miles per hour.

Amperes	Generator Data	R.P.M.
Neutral		550
4		800
8		1000
11-15		1200
11-14		2000

Charging rate is varied by the adjustment of the third brush setting. To move the third brush, loosen the three screws holding the bearing retainer plate on the commutator end and shift the plate. Move in a counter-clockwise direction to increase the charging rate, or in the opposite direction to decrease the charging rate. Tighten the adjusting screws and reseal the brush after making the adjustment. Maximum charging rate must not exceed 16 amperes.

OILING.—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted on the generator frame. Relay closes at 550-600 R.P.M. of the armature or 7-8 miles per hour, and opens at 500-550 R.P.M. of the armature or 5-6 miles per hour. Relay contacts separate .046 to .062 inch. Air gap between the relay armature and coil core is .020 to .035 inch, contacts closed. To adjust relay connect a voltmeter between the positive (+) generator brush and ground. Then slowly speed up the generator and adjust the relay spring tension by turning the thumb nut until the contacts close when the voltmeter indicates 7.5 volts. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 18 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 3 cp.

CIRCUIT BREAKER.—A vibrating circuit breaker takes the place of fuses. It requires 25 amperes to start the vibrator. While vibrating the current is 3-5 amperes.

Plate No. 447

WESTCOTT MODELS A-38 AND C-38 (1920) DELCO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

BATTERY.—Willard, Type SJW -4, 6 volt, 117.5 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 2159. Distributor Model No. 5208. Breaker contacts separate .018 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING.—Put 4 or 5 drops of light engine oil in the distributor unit oilers every two weeks. If the track of the rotor button in the distributor head is not well polished, apply a small amount of vaseline with a soft cloth. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when the top dead center mark on the fly-wheel is $1\frac{3}{8}$ inches past the indicator, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .030 inch.

STARTER.—Model No. 181. Starter is connected to the engine through a set of reduction gears and a Bendix drive. Lock torque is 28 pound-feet at 4 volts, the current being 525 amperes. Starter running free takes 30 amperes at 6 volts. The brush tension should be from $2\frac{1}{4}$ to $2\frac{3}{4}$ pounds for each brush. The direction of rotation is clockwise, looking at the commutator end.

OILING.—Put 4 or 5 drops of light engine oil in each of the starter bearing oilers every month. Remove the grease plug in the reduction gear housing and inject soft cup grease every six months. Saturate the wick oiler in the end of the Bendix gear case with light engine oil every year.

GENERATOR.—Model No. 165. Rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. Maximum charging rate is 11-15 amperes, reached at 1200 R.P.M. of the armature or 16-20 miles per hour.

Amperes	Generator Data	R.P.M.
Neutral		550
4		800
8		1000
11-15		1200
11-14		2000

Charging rate is varied by the adjustment of the third brush setting. To move the third brush, loosen the three screws holding the bearing retainer plate on the commutator end and shift the plate. Move in a counter-clockwise direction to increase the charging rate, or in the opposite direction to decrease the charging rate. Tighten the adjusting screws and reseal the brush after making the adjustment. Maximum charging rate must not exceed 16 amperes.

OILING.—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted on the generator frame. Relay closes at 550-600 R.P.M. of the armature or 7-8 miles per hour, and opens at 500-550 R.P.M. of the armature or 5-6 miles per hour. Relay contacts separate .046 to .062 inch. Air gap between the relay armature and coil core is .020 to .035 inch, contacts closed. To adjust relay connect a voltmeter between the positive (+) generator brush and ground. Then slowly speed up the generator and adjust the relay spring tension by turning the thumb nut until the contacts close when the voltmeter indicates 7.5 volts. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 18 cp. Dimmer lamps are 6-8 volt, 5 cp. Dash, tail, step and tonneau lamps are 6-8 volt, 2 cp. Dome lamp is 6-8 volt, 5 cp.

CIRCUIT BREAKER.—A vibrating circuit breaker takes the place of fuses. It requires 25 amperes to start the vibrator. While vibrating the current is 3-5 amperes.

DAVIS

MODELS 51-55 (1920). SERIAL NOS. 6501 UP
DELCO GENERATING, STARTING AND LIGHTING SYSTEM
DELCO IGNITION

BATTERY.—Willard, Type SJWN-3, 6 volt, 80 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 2159. Distributor Model No. 5207. Breaker contacts separate .018 inch. They are made of platinum. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oilstone.

Oiling.—Put 3 or 4 drops of light engine oil in the ignition unit oilers every two weeks. If the track of the rotor button in the distributor head is not well polished, apply a small amount of vaseline with a soft cloth. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

Timing.—Breaker contacts begin to separate when the top dead center mark on the fly-wheel is $1\frac{3}{8}$ inches past the indicator, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—Spark plug gaps are .030 inch.

STARTER.—Models 164 and 181. Starter is connected to the engine through a Bendix drive. Lock torque is 28 pound-feet at 4 volts, the current being 525 amperes.

Oiling.—Put 4 or 5 drops of light engine oil in the starter oilers every month. Remove the grease plug and inject soft cup grease every six months.

GENERATOR.—Model No. 165. Rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. Maximum charging rate is 11-15 amperes, reached at 1200 R.P.M. of the armature, or 16-20 miles per hour.

Generator Data

Amperes	R.P.M.
Neutral	500
4	800
8	1000
11-15	1200
11-14	2000

Charging rate is varied by adjustment of the third brush setting. To move the third brush, loosen the three screws holding the bearing retainer plate on the commutator end and shift the plate. Move in a counter-clockwise direction to increase the charging rate, or in the opposite direction to decrease the charging rate. Tighten the adjusting screws and reseal the brush after making the adjustment. Maximum charging rate must not exceed 16 amperes.

Oiling.—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted on the generator frame. Relay closes at 550-600 R.P.M. of the armature or 7-8 miles per hour, and opens at 500-550 R. P. M. of the armature or 5-6 miles per hour. Relay contacts separate .046 to .062 inch. Air gap between relay armature and coil core is .020 to .035 inch, contacts closed. To adjust relay, connect a voltmeter between the positive (+) generator brush and the ground. Then slowly speed up the generator and adjust the relay spring tension by turning the thumb nut, until the contacts close when the voltmeter indicates 7.5 volts. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 24 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp.

CIRCUIT BREAKER.—A vibrating circuit breaker takes the place of fuses. It requires 25 amperes to start the vibrator, but 3.5 amperes will cause it to continue.

Plate No. 449

REVERE

MODEL C (1920)

WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM BOSCH IGNITION

BATTERY.—Willard, Type SJR-6, 6 volt, 120 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Breaker contacts separate .014 to .016 inch. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Put 2 or 3 drops of light engine oil in each of the magneto oilers every two weeks. Put a small amount of vaseline on the fiber bumper of the contact arm, applying with a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 3, 4, 2.

SPARK PLUG GAPS.—Spark plug gaps are .025 inch.

STARTER.—Frame 776. Starter is connected to the engine through a Bendix drive. Lock torque is 31 pound-feet, current being 750 amperes at 4 volts. The magnetic switch is connected to the relay-regulator in such a manner that it cannot operate after the relay has closed.

OILING.—Put 5 or 6 drops of light engine oil in each of the starter oilers every month.

GENERATOR.—Frame 781, Type S-293,478 or N-301,687. Generator voltage regulation is by vibrating regulator. Maximum generator output is 20 amperes at 6.5 volts, reached at 1200 R.P.M. of the armature or 20 miles per hour. Charging rate reduces to 4 amperes as battery becomes fully charged. Shunt field current is 1.4 to 1.6 amperes at 6 volts. Operating freely as a motor, generator takes 5 amperes at 6 volts.

OILING.—Put 4 or 5 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY-REGULATOR.—Relay closes at 550-600 R.P.M. of the armature or 8-10 miles per hour, and opens at 500-550 R.P.M. of the armature or 6-8 miles per hour. To adjust the relay, regulate the spring tension until the contacts open with a discharge current of 1 to 3 amperes. Then disconnect the battery and vary the air gap between relay armature (moving member) and coil core by bending the lower prong, until relay contacts just close when a voltmeter connected from the "A" generator terminal to ground indicates 6.5 to 7 volts. This air gap between the relay armature and coil core is .055 to .060 inch. To adjust the regulator, disconnect the wire from the terminal "B" and connect a voltmeter between this post and ground. Operate the engine at a speed corresponding to 20 miles per hour, or drive the generator at 1200 R.P.M., and adjust the spring tension on the regulator armature by turning the thumb screw until the voltmeter indicates 8.75 volts. Clean relay and regulator contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 17 cp. Dimmer lamps are 6-8 volt, 5 cp. Side lamps are 6-8 volt, 5 cp. Dash lamp is 6-8 volt, 2 cp. Tail lamp is 6-8 volt, 4 cp.

FUSES.—Fuses are 15 ampere.

KING MODEL H (1920) WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM ATWATER KENT IGNITION

BATTERY.—Prest-O-Lite, Type 615-RHN, 6 volt, 120 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Type CC. Breaker contacts separate .006 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oilstone.

OILING.—Remove the distributor cap every two weeks and put 4 or 5 drops of light engine oil in the exposed oil hole. Put a small amount of vaseline on the cam, applying with a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1R, 4L, 3R, 2L, 4R, 1L, 2R, 3L.

SPARK PLUG GAPS.—Spark plug gaps are .025 inch.

STARTER.—Frame No. 100. Starter is connected to the engine through a Bendix drive. Starter cranks the engine at 125 R.P.M., taking 250 amperes. Lock torque is 12 pound-feet, current being 475 amperes at 4 volts. Running freely, starter takes 75 amperes, armature revolving 4000 R.P.M.

OILING.—Put 5 or 6 drops of light engine oil in the starter oilers every month.

GENERATOR.—Frame 150. Generator current regulation is by the third brush system. Maximum current output is 15-16 amperes at 7.5 volts, reached at 1450-1750 R.P.M. of the armature or 25 miles per hour.

Generator Data		
Amperes	R.P.M.	Volts
0	575	6.5
8.5-10.5	1000	7-7.5
15-16	1450-1750	7.5

Shunt field winding takes 3.25 to 4 amperes at 6 to 6.3 volts. Move the third brush in the direction of armature rotation to increase the charging rate, and in the opposite direction to decrease the charging rate.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted in the generator frame. Relay closes at 575-625 R.P.M. of the armature or 7-9 miles per hour and opens at 525-575 R.P.M. of the armature or 5-7 miles per hour. Adjust the spring tension on relay armature so that the contacts open with a discharge current of 0-3 amperes. Adjust the air gap between the relay armature and coil core so that the contacts close when the voltage of the generator reaches 6.2-6.5 volts. Air gap between relay armature and coil core is .005 inch, contacts closed. Contacts separate .030 to .035 inch. Resistance of the shunt coil is 68 ohms. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 18 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp.

HUDSON **SUPER-SIX, MODEL O (1919-20)** **DELCO GENERATING, STARTING AND LIGHTING SYSTEM** **DELCO IGNITION**

HUDSON
Super-Six, Model O (1920)
Delco System

Plate No. 451

BATTERY.—Exide, Type 3-A-15-1, 6 volt, 100 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 2170. Distributor Model No. 5203. Breaker contacts separate .018 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or again the flat side of an emery wheel, finishing on a hard oil stone

OILING.—Put several drops of light engine oil in the distributor bearing oilers every two weeks. If the track of the rotor button in the distributor head is not well polished, apply a small amount of vaseline with a soft cloth. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles. Thoroughly clean out and repack the driving gear housing with soft cup grease every six months.

TIMING.—Breaker contacts begin to separate when the flywheel mark "A—" is at the indicator, spark control lever and breaker assembly in the fully advanced position. The mark "A—" is one-half inch before the top dead center mark "DC 1 & 6".

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .025 to .028 inch.

STARTER-GENERATOR.—Model No. 140. Starter and generator are combined into one unit. Starter is connected to the engine through a set of reduction gears, meshed by the operator. Two overrunning clutches are provided. In connection with the ignition switch, a circuit is closed, allowing current to flow through the generator windings, causing the armature to revolve slowly, aiding the meshing of the reduction gears. One clutch permits this rotation, and also permits a relatively high speed of the armature, necessary when operating as a starter. The second overrunning clutch prevents the engine driving the armature through the reduction gears. Depressing the starter pedal meshes the reduction gears, opens the generator circuit, and allows the motor brushes to come in contact with the commutator, closing the starter circuit and cranking the engine. When the pedal is released, a spring reverses these operations.

GENERATOR.—Generator current regulation is by third brush system.

Amperes	Generator Data—Model No. 140	R.P.M.
0		440
8-11		800
14-16		1300
11-14		2000
8-11		2500

Charging rate is varied by adjusting the third brush setting. Loosen the two screws in the third brush arm, and lengthen the arm to increase the charging rate. Shorten the arm to decrease the charging rate. Reseat the brush after adjusting position.

OILING.—Put 5 or 6 drops of light engine oil in each of the starter-generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—There is no relay. The circuit between the generator and battery is controlled by the ignition switch.

LAMPS.—Head lamps are 6-8 volt, 15 cp. Dash and tail lamps are 3-4 volt, 2 cp.

CIRCUIT-BREAKER.—A vibrating circuit-breaker takes the place of fuses. It requires a current of 25 amperes to start the vibrator. but 3-5 amperes will cause it to continue.

MODELS 681-684 (1920)

BATTERY.—Willard, Type SJRN-4, 6 volt, 117 ampere-hour. The positive (+) terminal is grounded.

OILING.—Screw up the grease cup under the breaker head one-half turn every two weeks. If the car is driven more than 500 miles in two weeks, this must be done every 500 miles. Put 3 or 4 drops of light engine oil on the wick in the breaker lever spindle every 6 months.

TIMING.—Breaker contacts begin to separate when piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .025 to .028 inch.

STARTER.—Model E.M.-279, Type 46-T. Starter is connected to the engine through a Bendix drive. Starter cranks the engine at 125 R.P.M., current being 200 amperes. Operating freely, starter current is 60-90 amperes, armature revolving at 6800 R.P.M. Lock torque is 13.8 pound-feet, current being 600 amperes.

OILING.—Put 5 or 6 drops of light engine oil in each of starter oilers every month. Remove the plug in the reduction gear housing and inject Gredag grease every six months.

GENERATOR.—Model No. E.M.-337. Generator current regulation is by the third brush system. Maximum charging rate is 12 amperes, reached at 18-23 miles per hour.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Model I-471. Relay closes at 8-10 miles per hour or 640-800 R.P.M. of the armature, and opens at 6-8 miles per hour or 480-640 R.P.M. of the armature. Charging current at closing is 2 amperes, and the discharge current is 0.4 amperes at opening of relay contacts. Relay contacts separate .035 to .065 inch. Air gap between relay armature (moving member) and coil core is .025 inch, contacts closed. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 20 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp.

FUSES.—Fuses are 20 ampere.

Plate No. 453

BREWSTER

1917-20

U. S. L. GENERATING, STARTING AND LIGHTING SYSTEM BERLING IGNITION

BATTERY.—U. S. L., Type HDN-611-C, 12 volt, 93 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Magnet breaker contacts separate .016 to .020 inch. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Put 10 drops of light engine oil in each of the magneto oil cups every month. Put a small amount of vaseline on the cam and on the rubbing surfaces of the fiber lever, applying with a toothpick. If the car is driven more than 1000 miles in a month, these attentions must be given every 1000 miles.

TIMING.—Breaker contacts begin to separate when piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 3, 4, 2.

SPARK PLUGS.—Spark plugs are $\frac{7}{8}$ inch in diameter. Gaps should be .020 inch.

STARTER-GENERATOR.—Model E-207. Armature is fastened to the engine crankshaft, taking the place of the flywheel. When operating as a starter, the unit cranks the engine at 175 R.P.M., taking 185 amperes.

GENERATOR.—Generator current regulation is by third brush and compensating field. Maximum current output is 12 amperes at 500 R.P.M. of the armature or 18 miles per hour. Pressure of brushes on the commutator is $1\frac{3}{4}$ pounds.

OILING.—Starter-generator requires no oiling.

RELAY.—Relay closes at 11 miles per hour or 350 R.P.M. of the armature, and opens at 9 miles per hour or 250 R.P.M. of the armature. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 12-16 volt, 36 cp. Dimmer lamps are 12-16 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp.

FUSES.—Lighting fuses are 20 ampere. Large fuse in relay box is 30 ampere. Small field fuse is 6 ampere capacity.

Plate No. 454

MONITOR

1920

DYNETO GENERATING, STARTING AND LIGHTING SYSTEM CONNECTICUT IGNITION

BATTERY.—Prest-O-Lite, 6 volt, 110 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Breaker contacts separate .020 inch. When the condition of the points affects the ignition, renew the inner breaker mechanism. For temporary service, resurface contacts with fine emery cloth.

OILING.—Refill the cup under the breaker head with pure vaseline and turn down every month. If the car is driven more than 1000 miles in a month, this must be done every 1000 miles.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly one-third advanced.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .030 inch.

STARTER.—Model D-288. Starter is connected to the engine through a Bendix drive. Starter cranks the engine at 125 R.P.M., taking 130 amperes.

Starter Data

Torque	R.P.M.	Amperes	Volts
0.0 lb. ft.	5600	25	6.4
2.5 lb. ft.	1400	150	5.8
5.0 lb. ft.	850	250	5.3
7.5 lb. ft.	550	330	5.0
10.0 lb. ft.	250	420	4.6
14.0 lb. ft.	Lock	530	4.0

OILING.—Put 5 or 6 drops of light engine oil in each of the starter oilers every month.

GENERATOR.—Model C-288. Generator current regulation is by third brush system. Maximum current output is 12-15 amperes, reached at 1200 R.P.M. of the armature or 24 miles per hour.

Generator Data

Amperes	Hot Test	R.P.M.	Amperes	Cold Test	R.P.M.
5.0		600	6.0		600
10.0		900	13.0		900
12.0		1200	15.0		1200
11.5		1600	13.5		1600
10.0		2000	11.5		2000

Shunt field current is 3.5 amperes at 6 volts. Charging rate is varied by adjusting the third brush setting. Remove the leather plug in the commutator end plate and loosen the screw exposed. Move in the direction of armature rotation to increase the charging rate, and in the opposite direction to decrease the charging rate. Replace the leather plug after the adjustment is made.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted on the generator frame. Relay closes at 8-10 miles per hour or 500-550 R.P.M. of the armature, and opens at 6-8 miles per hour or 450-500 R.P.M. of the armature. Relay contacts separate 3/32 inch. Air gap between relay armature and coil core is 1/8 inch, contacts open. Clean contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 15 cp. Dash and tail lamps are 6-8 volt, 2 cp.

Plate No. 455

MAXWELL

MODEL 25 (1920). SERIAL NOS. 294,601 UP

SIMMS-HUFF GENERATING, STARTING AND LIGHTING SYSTEM

ATWATER KENT IGNITION

BATTERY.—Prest-O-Lite, Type 613-WHN, 87.5 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Type CC. Breaker contacts separate .006 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oilstone.

OILING.—Remove the distributor cap every two weeks and put 4 or 5 drops of light engine oil in the oil hole exposed. Put a small amount of vaseline on the cam, applying with a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when the top dead center mark on the flywheel is $1\frac{1}{4}$ inches past the indicator, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 3, 4, 2.

SPARK PLUG GAPS.—Spark plug gaps are .027 inch.

STARTER.—Type B. Starter is connected to the engine through a Bendix drive. Direction of rotation is counter-clockwise, looking at the commutator end. Starter cranks the engine at 170-200 R.P.M., taking 130 amperes.

Starter Data

Torque	R.P.M.	Amperes	Volts
0 lb. ft.	4000	50-60	6.0
1.65 lb. ft.	1400	140	5.0
13-16 lb. ft.	Lock	600	4.1

Brush tension is $2\frac{1}{2}$ to $3\frac{1}{2}$ pounds.

OILING.—Put 5 or 6 drops of light engine oil in the starter oilers every month.

GENERATOR.—Type G. Generator current regulation is by the third brush system. Direction of rotation is counter-clockwise, looking at the commutator end. Maximum charging rate is 15 amperes, reached at 1500 R.P.M. of the armature, or 22-25 miles per hour.

Generator Data

Amperes	Hot Test	R.P.M.	Amperes	Cold Test	R.P.M.
0	600		0	560	
12	1500		15	1500	

Field current is 3 amperes at 6 volts. Brush tension of all the brushes is 1 to 2 pounds. Charging rate is varied by adjustment of the third brush setting. Move the third brush in the direction of armature rotation to increase the charging rate and in the opposite direction to decrease the charging rate.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 8-10 miles per hour or 500-550 R.P.M. of the armature and opens at 7-8 miles per hour or 450-500 R.P.M. of the armature. Relay contacts separate .025 inch. Air gap between relay armature and coil core is .040 inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 15 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp.

FUSES.—Fuse is 20 ampere.

PIERCE-ARROW MODELS 38 AND 48 (1919-20) WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

Plate No. 456

BATTERY.—Willard, SJR-6, 6 volt, 120 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Coils Model No. 2171, Distributor Model No. 5202. A dual battery ignition system is provided. Breaker contacts separate .015 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING.—Put 5 or 6 drops of light engine oil in each of the distributor unit oilers every two weeks. If the rotor buttons and their tracks are not well polished apply a small amount of vaseline with a soft cloth. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles. Repack distributor driving gear compartment with soft cup grease every year.

TIMING.—Breaker contacts begin to separate when the flywheel mark "Ignition" is at the indicator, spark control lever and breaker assembly in the fully retarded position. This is the firing order for No. 1 cylinder. Both sets of contacts must open at the same time. The "Ignition" mark is 2 inches after top dead center.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .030 inch.

STARTER.—Frame No. 777, S-284,833. Starter is connected to the engine through a magnetic pinion shift. Lock torque is 27.5 pound-feet, current 750 amperes at 4 volts. Torque at 1250 R.P.M. is 3.5 pound-feet, current 230 amperes at 5.5 volts. Running freely, armature revolves at 5000 R.P.M., current 80 amperes at 5.5 volts. Brush pressure is 2½ to 3 pounds. Pinion must be pulled into mesh by a current of 125 amperes or less, and must not be held in by 80 amperes. When the plunger in the "In" position, the air gap between the plunger and the cover of the pull-in coil is 5/16 inch, including the micarta washer. With the plunger in the "In" position, the spring is compressed into an over-all length of 1 11/32 inches, and exerts a pressure of 7 pounds. With the plunger in the "Out" position, the spring measures 2 13/32 inches and exerts a pressure of 2 pounds.

OILING.—Put 4 or 5 drops of light engine oil in each of the starter bearing oilers and in the oiler over the pinion every month.

GENERATOR.—Frame 781-R, S-285,412. Generator voltage regulation is by vibrating regulator. Maximum generator output is 20 amperes at 6.5 volts, reached at 1200 R.P.M. of armature or 20 miles per hour. Charging rate reduces to 4 amperes as battery becomes fully charged. Shunt field current is 1.4 to 1.6 amperes at 6 volts. Operating freely as a motor, generator takes 5 amperes at 6 volts.

OILING.—Put 4 or 5 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY-REGULATOR.—Relay and regulator are combined into one unit and mounted on the engine side of the dash. Relay closes at 550-600 R.P.M. of armature or 8-10 miles per hour, and opens at 500-550 R.P.M. or 6-8 miles per hour. To adjust the relay, regulate the spring tension until the contacts open with a discharge current of 1 to 3 amperes. Then disconnect the battery and vary the air gap between relay armature and coil core by bending the lower prong, until relay contacts just close when a voltmeter connected from the "A" generator terminal to ground indicates 6.5 to 7 volts. This air gap between the relay armature and coil core is .055 to .060 inch. To adjust the regulator, disconnect the wire from terminal "B" and connect a voltmeter between this post and ground. Operate the engine at a speed corresponding to 20 miles per hour, or drive the generator at 1200 R.P.M. and adjust the spring tension on the regulator armature by turning the thumb screw until the voltmeter indicates 8.75 volts. Clean relay and regulator contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 20 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and trouble lamps are 6-8 volt, 4 cp. Tail, dome, pillar and tonneau lamps are each 6-8 volt, 4 cp. All lamps have single contact base.

FUSES.—Main circuit fuse is 30 ampere. Lighting circuit fuses are 10 ampere.

Plate No. 457

MAXWELL

MODEL 25 (1920). SERIAL NOS. 266,801 TO 294,601

SIMMS-HUFF GENERATING, STARTING AND LIGHTING SYSTEM

ATWATER KENT IGNITION

BATTERY.—Prest-O-Lite, Type 127-WMN, 12 volt, 35 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Type CC. Breaker contacts separate .006 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING.—Remove the distributor cap every two weeks and put 4 or 5 drops of light engine oil in the oil hole exposed. Put a small amount of vaseline on the cam, applying with a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 3, 4, 2.

SPARK PLUG GAPS.—Spark plug gaps are .025 inch.

STARTER-GENERATOR.—Model SMS-3. Starter and generator are combined to form a single unit. The unit is connected to the engine through a pinion shifted by the operator when operating as a starter, and is driven by the fan belt when operating as a generator. Running freely, starter takes 5 amperes at 13 volts, armature revolving at 1110 R.P.M.

GENERATOR.—Generator current regulation is by the third brush system. Maximum current output is 12 amperes, reached at 1750-1900 R.P.M. of the armature or 15-20 miles per hour. Charging rate reduces to 10 amperes at 3000 R.P.M. of the armature or 30 miles per hour.

OILING.—Put 5 or 6 drops of light engine oil in the starter-generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 11-13 miles per hour or 1350-1400 R.P.M. of the armature and opens at 10 miles per hour or 1300 R.P.M. of the armature. Relay contacts separate .025 inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 12-16 volt, 21 cp. Dimmer lamps are 12-16 v lt, 4 cp. Dash and tail lamps are 12-16 volt, 2 cp.

FUSES.—Fuse is 20 ampere.

Plate No. 458

STEPHENS

SALIENT SIX (1919) AND SERIES 2 MODEL 20 (1920)

AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM

CONNECTICUT IGNITION

BATTERY.—U. S. L., 6 volt, 120 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Breaker contacts separate .025 inch. When the condition of the contacts affects the ignition, renew the inner breaker mechanism. For temporary service, resurface with fine emery cloth.

OILING.—Refill the cup under the breaker head with pure vaseline and turn down every month. If the car is driven more than 1000 miles in a month, this must be done every 1000 miles. Do not put grease or oil in the cup.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 4, 2, 6, 3, 5.

SPARK PLUG GAPS.—Spark plug gaps are .025 to .030 inch.

STARTER.—Model MH. Starter is connected to the engine through a Bendix drive. Starter cranks the engine at 150 R.P.M., taking 275 amperes. Lock torque is 17.5 pound-feet, current being 600 amperes at 5 volts.

OILING.—Put 5 or 6 drops of light engine oil in the starter oilers every month.

GENERATOR.—Model GJ-1020. Generator current regulation is by the third brush system. Maximum current output is 12-16 amperes, reached at 1700 R.P.M. of the armature or 22 miles per hour.

Hot Test		Generator Data		Cold Test	
Amperes	R.P.M.	Amperes	R.P.M.	Amperes	R.P.M.
0	500	0	460		
8	750	6	840		
12	960	9	1050		
16	1400	12	1360		
16.5	1700	12.7	1700		
12	3400	10	3400		

Above readings are obtained with generator charging a battery of 1.300 solution.

OILING.—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 9 miles per hour or 580 R.P.M. of armature and opens at 7 miles per hour or 360 R.P.M. of armature. Relay contacts separate .030 to .045 inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 15 cp. Side lamps are 6-8 volt, 2 cp. Dash and tail lamps are 6-8 volt 2 cp. Dimmer lamps are not used on 1919 cars.

FUSES.—Fuses are 20 ampere.

LOCOMOBILE

SERIES V, VI AND VII (1919-20). SERIAL NOS. 16,000 UP
WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM
BERLING MAGNETO IGNITION

LOCOMOBILE
MODEL 48 SERIES S. 6.7
(WESTINGHOUSE STARTER AND GENERATOR)

Plate No. 459

- BATTERY.**—Exide, 6 volt, 130 ampere-hour. The positive (+) terminal is grounded.
- IGNITION.**—Berling, Two-spark Dual. Breaker contacts separate .016 to .020 inch. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.
- OILING.**—Put 10 drops of light engine oil in the magneto oilers every month. Put a small amount of vaseline on the cam and rubbing surfaces of the fiber lever, applying with a toothpick. If the car is driven more than 1000 miles in a month, these attentions must be given every 1000 miles.
- TIMING.**—Magneto breaker contacts begin to separate when the piston on the compression stroke is $\frac{3}{16}$ inch from top dead center, spark control lever and breaker assembly in the fully retarded position. Battery breaker contacts begin to separate when the piston of the compression stroke is $\frac{7}{16}$ inches from top dead center, spark control lever and breaker assembly in the fully retarded position.
- FIRING ORDER.**—The firing order is 1, 5, 3, 6, 2, 4.
- SPARK PLUG GAPS.**—Spark plug gaps are .024 to .025 inch on the inlet side and .023 inch on the exhaust side.
- STARTER.**—Frame 777. Starter is connected to the engine through a magnetic pinion shift. Lock torque is 27.5 pound-feet, current 750 amperes at 4 volts. Torque at 1250 R.P.M. is 3.5 pound-feet, current 230 amperes at 5.5 volts. Running freely, armature revolves at 5000 R.P.M., current 80 amperes at 5.5 volts. Brush pressure is $2\frac{1}{2}$ to 3 pounds. Pinion must be pulled into mesh by a current of 125 amperes or less, and must not be held in by 80 amperes. With the plunger in the "In" position, the air gap between the plunger and the cover of the pull-in coil is $\frac{5}{16}$ inch, including the micarta washer. With the plunger in the "In" position, the spring is compressed into an over-all length of $1\frac{11}{32}$ inches, and exerts a pressure of 7 pounds. With the plunger in the "Out" position, the spring measures $2\frac{13}{16}$ inches and exerts a pressure of 2 pounds. Pressure of brushes on commutator is 2.5 to 3 pounds.
- OILING.**—Put 5 or 6 drops of light engine oil in each of the starter oilers every month.
- GENERATOR.**—Frame No. 760. Generator current regulation is by the third brush system. Maximum current output is 15-17 amperes, reached at 1250 R.P.M. of the armature or 16-20 miles per hour.

Generator Data					
Amperes	Cold Test	R.P.M.	Amperes	Hot Test	R.P.M.
0	_____	450	0	_____	500
8	_____	675	6	_____	725
12	_____	840	9	_____	850
15-17	_____	1250	12-14	_____	1250
10	_____	2000	7-8	_____	2000

The cold test readings are obtained with a generator temperature under 95°F. The hot test readings are obtained after the generator has been operated one hour at 1800 R.P.M., charging a half-charged battery. Shunt field current is 2.8 to 3.25 amperes at 6 volts. When the generator is operating freely as a motor, current is 3.5 to 5 amperes at 6 to 6.6 volts.

- OILING.**—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.
- RELAY.**—Relay is mounted in the generator frame. Relay closes at 500-550 R.P.M. of the armature or 7-9 miles per hour and opens at 450-500 R.P.M. of the armature or 5-7 miles per hour. Adjust the spring tension on the relay armature so that the contacts open with a discharge current of 0.3 amperes. Adjust the air gap between the relay armature and coil core so that the contacts close when the voltage of the generator reaches 6.2 to 6.5 volts. Air gap between relay armature and coil core is .005 inch, contacts closed. Contacts separate .030 to .035 inch. Resistance of the shunt coil is 68 ohms. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.
- LAMPS.**—Head lamps are 6-8 volt, 21 cp. Dimmer lamps are 6-8 volt, 6 cp. Tail, tonneau and step lamps are 6-8 volt, 4 cp. Dash lamp is 6-8 volt, 3 cp.
- FUSES.**—Fuses are 10 ampere.

TEXAN

MODELS A-38 AND B-38 (1920)

BIJUR GENERATING, STARTING AND LIGHTING SYSTEM CONNECTICUT IGNITION

BATTERY.—Prest-O-Lite, Type 611-KHNS, 6 volt, 80 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Breaker contacts separate .018 inch. When the condition of the contacts affects the ignition, renew the inner breaker mechanism. For temporary service, resurface with fine emery cloth.

OILING.—Refill the cup under the breaker head with pure vaseline and turn down every month. If the car is driven more than 1000 miles in a month, this must be done every 1000 miles.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 3, 4, 2.

SPARK PLUG GAPS.—Spark plug gaps are .030 inch.

STARTER.—Type FD-140, M-1286. Starter is connected to the engine through a Bijur automatic pinion shift. Lock torque is 12.5 pound-feet, current being 375 amperes at 3.5 volts. Running freely, starter takes 35-45 amperes, armature revolving at 5000 R.P.M. Pressure of brushes on the commutator is 30 ounces.

OILING.—Put 5 or 6 drops of light engine oil in each of the starter oilers every month.

GENERATOR.—Type P-230, M-1329. Generator current regulation is by the third brush system. Maximum current output is 11-13 amperes, reached at 1700 R.P.M. of the armature or 25 miles per hour. Charging rate is varied by inserting a special toothed wrench in the adjusting hole in the commutator end plate and moving the third brush assembly through a ratchet engagement. Turn the adjusting wrench in a clockwise direction to increase the charging rate and in a counter-clockwise direction to decrease the charging rate.

RELAY.—Relay is mounted on the generator frame. Relay closes at 8-10 miles per hour or 750-800 R.P.M. of the armature and opens at 6-8 miles per hour or 700-750 R.P.M. of the armature. Relay contacts separate .015 inch. Air gap between relay armature (moving member) and coil core is .025 inch, contacts closed. Adjust the spring tension on relay armature so that contacts close when the voltage of the generator, measured across the main brushes, reaches 6.5 volts. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 16 cp. Dash and tail lamps are 6-8 volt, 5 cp.

FUSES.—Fuses are 20 ampere.

Plate No. 461

PAN-AMERICAN

1919-1920

WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM ATWATER KENT IGNITION

BATTERY.—Willard, 6 volt, 80 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Type CC. Breaker contacts separate .006 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING.—Remove the distributor cap every two weeks and put 4 or 5 drops of light engine oil in the oil hole exposed. Put a small amount of vaseline on the cam, applying with a toothpick. If the car is driven more than 500 miles in two weeks, these attention must be given every 500 miles

TIMING.—Breaker contacts begin to separate when the flywheel marking "1 & 6 DC" is one inch past the indicator, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUGS.—Diameter, $\frac{7}{8}$ inch. Spark plug gaps are .025 inch.

STARTER.—Frame 711. Starter is connected to the engine through a Bendix drive. Lock torque is 17 pound-feet, current being 525 amperes at 4 volts. Torque at 1300 R.P.M. is 2.5 pound-feet, current being 150 amperes at 5.5 volts. Running freely, starter takes 35-45 amperes at 5.5 volts, armature revolving at 3500-6000 R.P.M. Pressure of brushes on the commutator is 2.5 to 3 pounds.

OILING.—Put 5 or 6 drops of light engine oil in the starter oilers every month.

GENERATOR.—Frame No. 760. Generator current regulation is by the third brush system. Maximum current output is 13-17 amperes, reached at 1250 R.P.M. of the armature or 16-20 miles per hour.

Generator Data

Amperes	Cold Test	R.P.M.	Amperes	Hot Test	R.P.M.
0	450		0		500
8		675	6		725
12		840	9		850
15-17		1250	12-14		1250
10		2000	7-8		2000

The cold test readings are obtained with a generator temperature under 95°F. The hot test readings are obtained after the generator has been operated one hour at 1800 R.P.M., charging a half-charged battery. Shunt field current is 2.5 amperes at 6 to 6.3 volts. When generator is operated freely as a motor, current is 3.5 to 5 amperes at 6 to 6.6 volts. Charging rate is varied by adjustment of the third brush setting.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted in the generator frame. Relay closes at 8-10 miles per hour or 500-550 R.P.M. of the armature, and opens at 6-8 miles per hour or 450-500 R.P.M. of the armature. Adjust the spring tension on the relay armature so that the contacts open when the discharge current is 0-3 amperes. Adjust the air gap between the relay armature and coil core so that the contacts close when the voltage of the generator reaches 6.2 to 6.5 volts. Air gap between the relay armature and coil core is .005 inch, contacts closed. Contacts separate .030 to .035 inch. Resistance of the shunt coil is 68 ohms. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 32 cp. Dash lamp is 6-8 volt, 4 cp. Tail lamp is 6-8 volt, 2 cp.

FUSES.—Fuses are 15 amperes.

Plate No. 462

ELGIN MODELS H (1919) AND K (1920) WAGNER GENERATING, STARTING AND LIGHTING SYSTEM WAGNER IGNITION

BATTERY:—Willard (1919) Type SJR-3 6 volt, 90 ampere hour. The negative (—) terminal is grounded. (1920) Type SJW-3 6 volt, 93 ampere hour. The positive (+) terminal is grounded. (Note:—This installation is shown on the cut).

IGNITION.—Coil Model K-32. Distributor Model KC-335. Breaker contacts separate .024 to .029 inch. They are made of tungsten. When the condition of the contacts affects the ignition, renew the lever arm and contact screw.

If the car is driven more than 500 miles in two weeks, this must be done every 500 miles. Put 3 or 4 drops of light engine oil on the wick in the breaker lever spindle every 6 months.

TIMING.—Breaker contacts begin to separate when piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 4, 2, 6, 3, 5.

SPARK PLUG GAPS.—Spark plug gaps are .025 to .028 inch.

STARTER.—Model E.M.-298, Type 36-T. Starter is connected to the engine through a Bendix drive. Starter cranks the engine at 115 R.P.M., current being 160 amperes. Lock torque is 11.5 pound-feet, current being 475 amperes. Running freely, starter armature revolves at 8000 R.P.M., current being 60-90 amperes.

OILING.—Put 5 or 6 drops of light engine oil in each of starter oilers every month.

GENERATOR.—Model E.M.-316, Type 46-V-5, or Model E.M.-200, Type 41-Y. Generator current regulation is by third brush system. Maximum current output is 16 amperes, reached at 20-23 miles per hour.

Generator Data		
Amperes	Model E.M.-200, Type 41-Y.	R.P.M.
0		660
6		880
9		1000
12		1200
15		1650
11		2500

The maximum current output of the Model E.M.-316 generator is 16 amperes, reached at 1400 R.P.M. of the armature.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Model I-471. Relay closes at 8-10 miles per hour or 567-710 R.P.M. of the armature, and opens at 6-8 miles per hour or 425-567 R.P.M. of the armature. Relay contacts separate .035 to .065 inch. Air gap between relay armature (moving member) and coil core is .025 inch, contacts closed. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 17 cp. Dash and tail lamps are 6-8 volt, 2 cp. On the Model "H" cars, head lamps are 6-8 volt, 15 cp. Tail lamp is 6-8 volt, 4 cp.

FUSES.—Fuses are 20 ampere.

STEARNs-KNIGHT

MODEL SKL-4 (1920)

WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTM ATWATER KENT IGNITION

BATTERY.—Willard, 12 volt, 61.5 ampere-hour. The positive (+) terminal is grounded.
IGNITION.—Type CC. Breaker contacts separate .006 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING.—Remove the distributor head and put 4 or 5 drops of light engine oil in the exposed oil hole every two weeks. Put a small amount of vaseline on the cam, applying with a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when the top dead center mark on the fly-wheel is 2 to 2½ inches past the indicator, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 3, 4, 2.

SPARK PLUGS. Diameter, ⅞ inch. Spark gaps are .025 inch.

STARTER.—Frame No. 755. Starter is connected to the engine through a Bendix drive. Starter cranks the engine at 125 R.P.M., taking 100 amperes.

Starter Data

Torque	R.P.M.	Amperes	Volts
0 lb. ft.	3000-4500	50-70	5.5
3.5 lb. ft.	1250	154	10.5
20 lb. ft.	Lock	500	5.5

Use a 6 volt battery when making the no-load test. Pressure of brushes in the commutator is 2 to 3 pounds.

OILING.—Put 5 or 6 drops of light engine oil in the starter oilers every month.

GENERATOR.—Frame No. 765. Generator current regulation is by the third brush system. Maximum current output is 9-11 amperes, reached at 1000 R.P.M. of the armature or 16-20 miles per hour. Two generators have been used, one with high resistance field coils and one with lower resistance field coils.

Generator Data.—Frame No. 765

With Low Resistance Field		With High Resistance Field	
Amperes	R.P.M.	Amperes	R.P.M.
0	390	0	420
5	560	6	660
4-7	2000	5.0-9	2000
9-10	750-950	10.5-11	1000-1400

Field Test

Amperes	Volts	Amperes	Volts
4.5-5.25	12-13	1.75-2.25	12-13

Charging rate is varied by adjustment of the third brush setting. Shift the third brush in the direction of armature rotation to increase the charging rate and in the opposite direction to decrease the charging rate. The field fuse, mounted on the end of the generator, is 5 ampere for the machine with high resistance field coils and 10 ampere for the machine with low resistance field coils.

OILING.—Put 5 or 6 drops of light engine oil in the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 400-450 R.P.M. of the armature or 6-7 miles per hour and opens at 350-400 R.P.M. of the armature or 5-6 miles per hour. Adjust relay spring tension so that contacts open with a discharge current of 0.3 amperes from the battery. Adjust the armature stop (which determines the air gap between the armature and coil core) so that the contacts close when the voltage of the generator reaches 12.4 to 13 volts. Contacts separate .030 to .035 inch. Air gap between relay armature and coil core is .005 inch, contacts closed. Resistance of the shunt coil is 274 ohms. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 12-16 volt, 21 cp. Dimmer lamps are 12-16 volt, 4 cp. Dash and tail lamps are 12-16 volt, 2 cp.

FUSES.—Fuses are 20 ampere.

Plate No. 463

Plate No. 464

BIDDLE

1919-20

GRAY & DAVIS GENERATING, STARTING AND LIGHTING SYSTEM SIMMS OR SPLITDORF IGNITION

BATTERY.—Willard, 6 volt, 90 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Breaker contacts separate .020 inch. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Put 4 or 5 drops of light engine oil in the magneto oilers every month. If the car is driven more than 1000 miles in a month, the oiling must be done every 1000 miles.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 3, 4, 2.

SPARK PLUGS.—Diameter, $\frac{7}{8}$ inch. Spark gaps are .025 inch.

STARTER.—Model No. 513. Starter is connected to the engine through a Bendix drive. Starter cranks the engine at 150 R.P.M., taking 140-180 amperes.

Starter Data

Torque	R.P.M.	Amperes
1 lb. ft.	2100	100
4 lb. ft.	1200	195
6 lb. ft.	900	260
8 lb. ft.	650	320
15 lb. ft.	Lock	500

OILING.—Put 5 or 6 drops of light engine oil in each of the starter oilers every month.

GENERATOR.—Model No. 801. Generator current regulation is by the third brush system. Maximum current output is 18 amperes, reached at 1200 R.P.M. of the armature or 15-18 miles per hour.

Charging rate is varied by adjustment of the third brush setting. Adjustment is made by turning the pinion screw located at the bottom of the rear cover plate, between the fuse and the relay. Turn this screw to the right to increase the charging rate, and to the left to decrease the charging rate.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted on the generator frame. Relay closes at 500 R.P.M. of the armature or 8-10 miles per hour and opens at 450 R.P.M. of the armature or 6-8 miles per hour. Relay contacts separate .015 to .018 inch. Air gap between relay armature and coil core is .010 to .012 inch, contacts closed. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp.

Plate No. 465

MAXWELL

MODEL 25 (1920). SERIAL NOS. 294,601 UP

AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM

ATWATER KENT IGNITION

BATTERY.—Prest-O-Lite, Type 613-WHN, 6 volt, 87.5 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Type CC. Breaker contacts separate .006 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING.—Remove the distributor cap every two weeks and put 4 or 5 drops of light engine oil in the oil hole exposed. Put a small amount of vaseline on the cam, applying with a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when the top dead center mark on the fly-wheel is $1\frac{1}{4}$ inches past the indicator, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 3, 4, 2.

SPARK PLUG GAPS.—Spark plug gaps are .027 inch.

STARTER.—Model No. MG. Starter is connected to the engine through a Bendix drive. Starter cranks the engine at 150 R.P.M., taking 120-150 amperes.

Starter Data		
Torque	R.P.M.	Amperes
2 lb. ft.	1280	135
6 lb. ft.	600	275
8 lb. ft.	400	335
10 lb. ft.	180	390
12 lb. ft.	Lock	500

OILING.—Put 5 or 6 drops of light engine oil in the starter oilers every month.

GENERATOR.—Model No. GJ. Generator current regulation is by the third brush system. Maximum current output is 12-16 amperes, reached at 1400-1700 R.P.M. of the armature or 20-25 miles per hour.

Generator Data					
Amperes	Cold Test	R.P.M.	Amperes	Hot Test	R.P.M.
0		500	0		580
8		750	6		840
12		960	9		1050
16		1400	12		1360
16.5		1700	12.7		1700
12		3400	10		3400

Above readings are obtained with generator charging a battery of 1.300 solution. Move the third brush in the direction of armature rotation to increase the charging rate and in the opposite direction to decrease the charging rate. Reseat the brush after adjusting position.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 8-10 miles per hour or 500-600 R.P.M. of the armature and opens at 6-8 miles per hour or 450-500 R.P.M. of the armature. Relay contacts separate .025 inch. Air gap between relay armature and coil core is .040 inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 15 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp.

Plate No. 466

FERRIS

MODEL C-20 (1920). SERIAL NOS. C-500 TO C-1500

LEECE-NEVILLE GENERATING, STARTING AND LIGHTING SYSTEM

SPLITDORF IGNITION

BATTERY.—Willard, SJRN-4, 6 volt, 120 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Aero, Type 649. Breaker contacts separate .020 inch. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Put 3 or 4 drops of light engine oil in each of the magneto bearing oilers every month. Put one drop of oil in the bearing of the breaker bar. If the car is driven more than 1000 miles in a month, the oiling must be done every 1000 miles.

TIMING.—Breaker contacts begin to separate when the top dead center mark on the fly-wheel is $\frac{1}{2}$ inch past the indicator, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Diameter $\frac{7}{8}$ inch. Spark plug gaps are .025 inch.

STARTER.—Model 347-M. Starter is connected to the engine through a Bendix drive. Starter cranks the engine at 110-150 R.P.M., taking 150-250 amperes. Running freely, starter takes 60 amperes, armature revolving at 4000 R.P.M. Lock torque is 16 pound-feet, current being 700 amperes at 3.5 volts.

OILING.—Put 5 or 6 drops of light engine oil in each of the starter oilers every month.

GENERATOR.—Model 388-G. Generator current regulation is by third brush system. Maximum charging rate is 15 amperes, reached at 1200 R.P.M. of the armature or 20 miles per hour. Charging rate is varied by adjustment of the third brush setting. To make an adjustment, first loosen the lock screw at the rear end of the generator, and then turn the thumb wheel. Turn to the right to increase the charging rate and to the left to decrease the charging rate. Tighten the locking screw after the adjustment is made.

OILING.—Put 4 or 5 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 25 amperes to cause the circuit breaker to operate. 500 miles.

RELAY.—Model 130-C. Relay closes at 8-10 miles per hour or 450-500 R.P.M. of the armature and opens at 6-8 miles per hour or 400-450 R.P.M. of the armature. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash lamp is 6-8 volt, 4 cp. Tail lamp is 6-8 volt, 2 cp.

FUSES.—Generator fuse, mounted on relay base, is 5 ampere.

CIRCUIT BREAKER.—A locking type circuit breaker takes the place of fuses. It requires 25 amperes to cause the circuit breaker to operate.

Plate No. 467

NORWALK

MODEL A-30-K (1920)

DYNETO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

BATTERY.—Battery is 6 volt, 80 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Breaker contacts separate .018 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING.—Put 4 or 5 drops of light engine oil in the distributor shaft bearing oiler every two weeks. If the track of the rotor button in the distributor head is not well polished, apply a small amount of vaseline with a soft cloth. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 3, 4, 2.

SPARK PLUG GAPS.—Spark plug gaps are .025 inch.

STARTER.—Model No. D-204. Starter is connected to the engine through a Bendix drive.

Starter Data

Torque	R.P.M.	Amperes	Volts
0.0 lb. ft.	5600	25	6.4
2.5 lb. ft.	1400	150	5.8
5.0 lb. ft.	850	250	5.3
10.0 lb. ft.	250	420	4.6
14.0 lb. ft.	Lock	530	4.0

OILING.—Put several drops of light engine oil in the starter oilers every month.

GENERATOR.—Model No. C-204. Generator current regulation is by the third brush system. Maximum current output of 14 amperes is reached at 16-18 miles per hour or 1500 R.P.M. of armature.

Generator Data

Amperes	M.P.H.	Volts
0	7-9	6.4
5	9-10	6.6
10	12-14	6.8
12-14	16-18	7.8
8	40-45	6.7

Charging rate may be varied by adjusting the third brush setting. Shunt field current is 3.5 amperes at 6.5 volts.

OILING.—Put 4 or 5 drops of light engine oil in the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 8-10 miles per hour or 450-500 R.P.M. of armature, and opens at 6-8 miles per hour or 400-450 R.P.M. of armature. Relay contacts separate 3/32 inch. Air gap between relay armature and coil core is 1/8 inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 15 cp. Dash and tail lamps are 6-8 volt, 2 cp.

STUTZ
1920
REMY MOTOR AND GENERATOR
DELCO IGNITION

Plate No. 468

STUTZ MODEL H (1920) REMY GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

BATTERY—Willard, 6 volt, 130 ampere-hour. The two-wire system is used.

IGNITION—Coils Model No. 2159. Distributor Model No. 5209. Breaker contacts separate .018 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone. Both sets of contacts must separate at the same instant.

OILING—Put 4 or 5 drops of light engine oil in each of the ignition unit oilers every two weeks. If the tracks of the rotor buttons in the distributor heads are not well polished, apply a small amount of vaseline with a soft cloth. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever $1\frac{1}{2}$ inches from the fully retarded position. (First see that the breaker assembly is in the fully retarded position.)

FIRING ORDER—The firing order is 1, 3, 4, 2.

SPARK PLUG GAPS—Spark plug gaps are .027 to .030 inch.

STARTER—Model No. 198-A. Starter is connected to the engine through a Bendix drive. When cranking the engine, the starter takes 160 amperes at 5.2 volts, armature revolving at 1960 R.P.M. Lock torque is 18 pound-feet, current being 650 amperes at 3.2 volts. Running freely, starter takes 40-65 amperes at 5.8-6 volts, armature revolving at 3600-4200 R.P.M.

OILING—Put 5 or 6 drops of light engine oil in each of the starter oilers every month.

GENERATOR—Model OD. Generator current regulation is by the third brush system. Maximum charging rate is 17.5 amperes, reached at 1450 R.P.M. or 23 miles per hour.

Amperes	Generator Data	R.P.M.
0		300
7.5		500
14-18		1000-1300
12		2050

Armature takes 12 amperes, with 6.5 volts applied across the main brushes. Shuntfield winding takes 1.3 amperes at 6.5 volts. The charging rate may be slightly decreased by filing away the edge of the third brush nearest the nearest main brush. Filing the opposite edge will increase the charching rate. Only a small portion of the third brush may be so removed however, or serious sparking will result.

OILING—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY—Relay closes at 8-10 miles per hour or 300-350 R.P.M. of the armature and opens at 6-8 miles per hour or 250-300 R.P.M. of the armature. Relay contacts separate .017 to .020 inch. Air gap between relay armature and coil core is .012 to .015 inch, contacts closed. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS—Head lamps are 6-8 volt, 15 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp.

Plate No. 469

LEACH

1920

DELCO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

BATTERY.—Prest-O-Lite, Type 619-RHN, 6 volt, 102 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Distributor Model 5215. Breaker contacts separate .018 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING.—Put 4 or 5 drops of light engine oil in the ignition unit oilers every two weeks. If the track of the rotor button in the distributor head is not well polished, apply a small amount of vaseline with a soft cloth. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when the top dead center mark on the fly-wheel is $1\frac{3}{8}$ inches past the indicator, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .025 inch.

STARTER.—Model No. 179. Starter is connected to the engine through a Bendix drive. Lock torque is 7 pound-feet.

OILING.—Put 5 or 6 drops of light engine oil in the starter oilers every month.

GENERATOR.—Model No. 180. Rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. Maximum charging rate is 11-15 amperes, reached at 1200 R.P.M. of the armature, or 16-20 miles per hour.

Generator Data	
Amperes	R.P.M.
Neutral	550
4	800
8	1000
11-15	1200
11-14	2000

Charging rate is varied by adjustment of the third brush setting. To move the third brush, loosen the three screws holding the bearing retainer plate on the commutator end and shift the plate. Move in a counter-clockwise direction to increase the charging rate, or in the opposite direction to decrease the charging rate. Tighten the adjusting screws and reseal the brush after making the adjustment. Maximum charging rate must not exceed 16 amperes.

OILING.—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted on the generator frame. Relay closes at 550-600 R.P.M. of the armature or 7-8 miles per hour, and opens at 500-550 R.P.M. of the armature or 5-6 miles per hour. Relay contacts separate .046 to .062 inch. Air gap between relay armature and coil core is .020 to .035 inch, contacts closed. To adjust relay, connect a voltmeter between the positive (+) generator brush and the ground. Then slowly speed up the generator and adjust the relay spring tension by turning the thumb nut, until the contacts close when the voltmeter indicates 7.5 volts. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 17 cp. Dimmer lamps are 6-8 volt, 5 cp. Dash and tail lamps are 6-8 volt, 2 cp.

CIRCUIT BREAKER.—A vibrating circuit breaker takes the place of fuses. It requires 25 amperes to start the vibrator, but 3-5 amperes will cause it to continue.

Plate No. 470

SINGER

SERIES 20 (1920)

WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM PHILBRIN IGNITION

BATTERY.—Willard, 6 volt, 115 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Model D, Duplex. Breaker contacts separate .008 to .012 inch. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file. When filing, hold the plunger contact so that it does not swing to one side. Remove all grit by drawing unglazed paper between the contacts. When the ignition switch is in the "H" position, a magnetic vibrator is connected in the primary circuit in place of the breaker, and a shower of sparks is produced at the plugs.

OILING.—Put 4 or 5 drops of light engine oil in the ignition unit oiler every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

TIMING.—Breaker contacts separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 9, 4, 11, 2, 7, 6, 10, 3, 8, 5, 12, cylinders being numbered as shown in the diagram.

SPARK PLUG GAPS.—Spark plug gaps are .020 inch.

STARTER.—Frame No. 751. Starter is connected to the engine through a Bendix drive.

Starter Data

Torque	R.P.M.	Amperes
2.5 lb. ft.	1450	140
7.5 lb. ft.	1150	200
12.5 lb. ft.	650	400
17.5 lb. ft.	500	530
21.0 lb. ft.	Lock	650

OILING.—Put 5 or 6 drops of light engine oil in the starter bearing oilers every month.

GENERATOR.—Frame No. 760. Generator current regulation is by the third brush system. Maximum current output is 15-17 amperes, reached at 1250 R.P.M. of the armature or 16-20 miles per hour.

Generator Data

Amperes	Cold Test	R.P.M.	Amperes	Hot Test	R.P.M.
0	450	0	500		
8	675	6	725		
12	840	9	850		
15-17	1250	12-14	1250		
10	2000	7-8	2000		

The cold test readings are obtained with a generator temperature under 95°F. The hot test readings are obtained after the generator has been operated one hour at 1800 R.P.M., charging a half-charged battery. Shunt field current is 2.8 to 3.25 amperes at 6 volts. When the generator is operating freely as a motor, current is 3.5 to 5 amperes at 6 to 6.6 volts.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted in the generator frame. Relay closes at 500-550 R.P.M. of the armature or 7-9 miles per hour and opens at 450-500 R.P.M. of the armature or 5-7 miles per hour. Adjust the spring tension on the relay armature so that the contacts open with a discharge current of 0-3 amperes. Adjust the air gap between the relay armature and coil core so that the contacts close when the voltage of the generator reaches 6.2 to 6.5 volts. Air gap between relay armature and coil core is .005 inch, contacts closed. Contacts separate .030 to .035 inch. Resistance of the shunt coil is 68 ohms. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 15 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp.

Plate No. 471

SEVERIN

1920

WAGNER GENERATING, STARTING AND LIGHTING SYSTEM WAGNER IGNITION

BATTERY.—Battery is 6 volt, 110 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Coil Model K-67. Distributor Model K-51. Breaker contacts separate .022 inch. They are made of tungsten. When the condition of the contacts affects the ignition, renew the lever arm and contact screw. Ignition current is 5.5 amperes, engine idle, ignition switch and breaker contacts closed.

OILING.—Screw up the grease cup under the breaker head one-half turn every two weeks. If the car is driven more than 500 miles in two weeks, this must be done every 500 miles. Put 3 or 4 drops of light engine oil on the wick in the breaker lever spindle every six months.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .025 inch.

STARTER.—Model EM-322. Starter is connected to the engine through a Bendix drive. Starter cranks the engine at 115-120 R.P.M., current being 160-170 amperes. Running freely, starter takes 80-90 amperes, armature revolving at 2000 R.P.M. Lock torque is 17.25 pound-feet, current being 650 amperes at 2.6 volts. Pressure of brushes on the commutator is 2.5 to 3 pounds.

OILING.—Put 5 or 6 drops of light engine oil in each of the starter oilers every month.

GENERATOR.—Model EM-276. Generator current regulation is by the third brush system. Maximum current output is 18 amperes at 20-25 miles per hour or 1450-1600 R.P.M. of the armature.

Amperes	Generator Data	R.P.M.
0		640
18		1450-1600
8		3000

Shunt field current is 7 amperes at 4.5 volts. Move the third brush in the direction of armature rotation to increase the charging rate and in the opposite direction to decrease the charging rate.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 9-11 miles per hour or 640-780 R.P.M. of the armature and opens at 7-9 miles per hour or 500-640 R.P.M. of the armature. Relay contacts separate .025 inch. Air gap between relay armature and coil core is .015 to .025 inch, contacts closed. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 17 cp. Dimmer lamps are 6-8 volt, 5 cp. Dash and tail lamps are 6-8 volt, 2 cp.

FUSES.—Fuses are 10 ampere.

McFARLAN

MODEL 127 (1920)

WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM WESTINGHOUSE AND BOSCH IGNITION

McFARLAN
Model 127 (1920)
Westinghouse Motor and Generator
Westinghouse and Bosch Ignition

Plate No. 472

BATTERY.—Willard, 6 volt, 120 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Westinghouse, Type SC. Breaker contacts separate .012 to .016 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone. The bumper on the contact spring is $\frac{1}{8}$ inch off center from the line through the centers of the shaft and terminal screw, this offset being opposite to the direction of rotation of the cam. The above adjustment is made by bending the solid arm at the terminal block. A pull of 20-25 ounces, applied to the movable contact, is required to separate the contacts .020 inch. The spring pressure is adjusted by bending the solid arm at the point of contact with the contact spring. Resistance of the primary winding of the ignition coil is 1 ohm. The resistance of the ballast resistor is .4 ohm. Resistance of the secondary winding is 4700 ohms.

IGNITION.—Bosch, Two-Spark. Breaker contacts separate .015 inch. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Put 4 or 5 drops of light engine oil in the oiler at the side of the breaker box and 2 or 3 drops on the magneto oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

TIMING.—Battery breaker contacts begin to separate when the top dead center mark on the flywheel rim is $\frac{1}{2}$ inch before the indicator, and magneto breaker contacts begin to separate when the dead center line on the flywheel is at the indicator, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUGS.—Diameter, $\frac{7}{8}$ inch. Spark gaps are .025 inch.

STARTER.—Frame No. 777. Starter is connected to the engine through a magnetically shifted pinion. The starting switch is also of the magnetic type, controlled by a push button on the dash. Lock torque is 27.5 pound-feet, current 750 amperes at 4 volts. Torque at 1250 R.P.M. is 3.5 pound-feet, current 230 amperes at 5.5 volts. Running freely, armature revolves at 5000 R.P.M., current 80 amperes at 5.5 volts. Brush pressure is $2\frac{1}{2}$ to 3 pounds. Pinion must be pulled into mesh by a current of 125 amperes or less, and must not be held in by 80 amperes. With the plunger in the "In" position, the air gap between the plunger and the cover of the pull-in coil is $\frac{5}{16}$ inch, including the micarta washer. With the plunger in the "In" position, the spring is compressed into an over-all length of $1\frac{11}{16}$ inches, and exerts a pressure of 7 pounds. With the plunger in the "Out" position, the spring measures $2\frac{13}{16}$ inches and exerts a pressure of 2 pounds. Pressure of brushes on commutator is 2.5 to 3 pounds.

OILING.—Put 5 or 6 drops of light engine oil in each of the starter oilers every month.

GENERATOR.—Frame 781-R. Generator voltage regulation is by vibrating regulator. Maximum charging rate is 20 amperes, reducing as the battery becomes charged. Shunt field winding takes 1.25 to 1.75 amperes at 6 to 6.3 volts. Running freely as a motor, generator takes 5 amperes at 6 to 6.3 volts.

OILING.—Put 5 or 6 drops of light engine oil in the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY-REGULATOR.—Relay closes at 425-450 R.P.M. of the armature or 6-7 miles per hour and opens at 400-425 R.P.M. of the armature or 5-6 miles per hour. Adjust relay spring tension so that the contacts open with a discharge current of 1 to 2 amperes from the battery. Adjust air gap between relay armature and coil core so that the contacts close when the voltage of the generator reaches 6.5 to 7 volts, battery disconnected. Air gap between relay armature and coil core is .055 to .060 inch. Air gap between regulator armature and coil core is .045 to .055 inch. Adjust regulator to limit the voltage to 6.5 volts with a 20 ampere resistance load, generator being driven at 1200 R.P.M. Clean relay and regulator contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn N .00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dimmer lamps are 6-8 volt, 12 cp. Tail and dash lamps are 6-8 volt, 2 cp.

Plate No. 473

HAYNES

MODEL 45 (1920). SERIAL NOS. 33,500 TO 38,000

LEECE-NEVILLE GENERATING, STARTING AND LIGHTING SYSTEM

KINGSTON IGNITION

BATTERY.—Willard, Type SXR-6, 6 volt, 100 ampere-hour. The two-wire system is used.

IGNITION.—Breaker contacts separate .020 inch. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Refill the grease cup under the breaker head with soft cup grease and turn down every month. If the car is driven more than 1000 miles in a month, this must be done every 1000 miles.

TIMING.—Breaker contacts begin to separate when the top dead center mark on the fly-wheel is $\frac{3}{4}$ inch past the indicator, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 4, 2, 6, 3, 5.

SPARK PLUG GAPS.—Spark plug gaps are .025 inch.

STARTER.—Type 186M. Starter is connected to the engine through a Bendix drive. Starter cranks the engine at 100-150 R.P.M., taking 150-250 amperes. Lock torque is 16 pound-feet, current being 700 amperes at 3.5 volts. Running freely, starter takes 60 amperes, armature revolving at 4000 R.P.M.

OILING.—Put 5 or 6 drops of light engine oil in each of the starter oilers every month.

GENERATOR.—Type E400. Generator current regulation is by the third brush system. Maximum charging rate is 16 amperes, reached at 1200 R.P.M. of the armature or 20 miles per hour. Charging rate is varied by turning the adjusting thumb nut on the front end cover of the generator. Before turning the thumb nut, loosen the lock screw just below and to the left of the nut. Turn the nut to the left to increase the charging rate and to the right to decrease the charging rate. Tighten the lock screw after adjustment is made.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator oilers every 500 miles. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 8-10 miles per hour or 450-500 R.P.M. of the armature and opens at 6-8 miles per hour or 400-450 R.P.M. of the armature. The charging current is 1-3 amperes at closing and the discharge current 0-1 ampere at opening of relay contacts. Contacts separate .030 inch. Clean contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 18 cp. Dimmer lamps are 6-8 volt, 5 cp. Dash and tail lamps are 6-8 volt, 2 cp.

FUSE.—Fuse on relay base is 5 ampere.

CIRCUIT BREAKER.—A circuit breaker takes the place of fuses in the lighting and ignition circuits. It requires 25 amperes to open the circuit.

Plate No. 474

HAYNES

MODEL 47 (1920)

LEECE-NEVILLE GENERATING, STARTING AND LIGHTING SYSTEM KINGSTON IGNITION

This Page applies to Model 48, with the exception of the Ignition Data.

BATTERY.—Willard, 6 volt, 120 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Breaker contacts separate .018 inch. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper. every two weeks. If the car is driven more than 500 miles in two weeks, this must be

OILING.—Refill the grease cup under the breaker head with soft cup grease and turn down done every 500 miles.

TIMING.—Breaker contacts begin to separate when the flywheel marking "Inlet" is at the indicator, spark control lever and breaker assembly in the fully retarded position. This mark is 25/64 inch past the top dead center mark.

FIRING ORDER.—The firing order is 1, 4, 2, 6, 3, 5.

SPARK PLUGS.—Diameter, 7/8 inch. Spark gaps are .025 inch.

STARTER.—Model 186-M. Starter is connected to the engine through a Bendix drive.

Starting switch is of the magnetic type, controlled by the ignition switch. When the ignition switch handle is depressed all the way down, the ignition system is connected and the starting switch operates. With the switch handle in the middle position, ignition only is in operation. Starter cranks the engine at 100-150 R.P.M., taking 150-250 amperes. Running freely starter takes 60 amperes, armature revolving at 4000 R.P.M., Lock torque is 16 pound-feet, current being 700 amperes at 3.5 volts.

OILING.—Put 5 or 6 drops of light engine oil in the starter bearing oilers every month.

GENERATOR.—Model No. E-400. Rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. Normal maximum charging rate is 16 amperes, reached at 20 miles per hour or 1200 R.P.M. of the armature. Charging rate is varied by turning thumb screw at the rear of the generator. Turn to the right (facing the rear end of the generator) to increase the charging rate, and to the left to decrease the charging rate. Never increase the maximum charging rate above 20 amperes. Field fuse, mounted on generator, is 5 ampere.

OILING.—Put 5 or 6 drops of light engine oil in the rear generator oiler every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles. Clean out and repack the front compartment with soft cup grease every month.

RELAY.—Relay is mounted on the rear of the dash panel. Relay closes at 8-10 miles per hour or 500 R.P.M. of the armature and opens at 6-8 miles per hour or 450 R.P.M. of the armature. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 16 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp.

FUSE.—Generator field fuse is 5 ampere, 1 1/4 inches long and 1/4 inch in diameter.

CIRCUIT-BREAKER.—A circuit-breaker takes the place of fuses. The air gap between the armature and coil core, and hence the current which the circuit-breaker will permit to flow through it, is adjustable by turning a screw, reached with a small screw driver through a hole in the bottom of the case.

HAYNES
Model 46 (1920)

Delco Ignition

Plate No. 475

HAYNES

MODEL 46 (1920)

LEECE-NEVILLE GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

The Ignition Wiring and Data given on This Page applies also to M del 48.

BATTERY.—Willard, 6 volt, 120 ampere-hour. The two-wire system is used.

IGNITION.—Model No. 5155. Breaker contacts separate .018 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING.—Put 3 or 4 drops of light engine oil in the two oil holes in the top of the distributor driving-gear housing every two weeks. If the tracks of the rotor buttons in the distributor heads are not well polished, apply a small amount of vaseline with a soft cloth. Every six months remove the plate on the top of the unit and repack the housing with soft cup grease.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly one-third advanced.

FIRING ORDER.—The firing order is 1R, 6L, 4R, 3L, 2R, 5L, 6R, 1L, 3R, 4L, 5R, 2L.

SPARK PLUGS.—Diameter, $\frac{7}{8}$ inch. Spark gaps are .025 inch.

STARTER.—Model No. 186-M. Starter is connected to the engine through a Bendix drive. Starter cranks the engine at 100-150 R.P.M., taking 150-250 amperes. Running freely starter takes 60 amperes, armature revolving at 4000 R.P.M. Lock torque is 16-pound feet, current being 700 amperes at 3.5 volts.

OILING.—Put 5 or 6 drops of light engine oil in the starter bearing oilers every month.

GENERATOR.—Model No. E-400. Rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. Normal maximum charging rate is 16 amperes, reached at 20 miles per hour, or 1200 R.P.M. of the armature. Charging rate is varied by turning the thumb screw at the rear of the generator. Turn to the right (facing rear end of generator) to increase the charging rate and to the left to decrease the charging rate. Never increase the maximum charging rate above 20 amperes. Field fuse, mounted on the relay base, is 5 ampere.

OILING.—Put 5 or 6 drops of light engine oil in the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted on the generator frame. Relay closes at 8-10 miles per hour or 500 R.P.M. of the armature and opens at 6-8 miles per hour or 450 R.P.M. of the armature. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 16 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp.

FUSE.—Generator field fuse is 5 ampere, $\frac{5}{8}$ inch long.

CIRCUIT-BRAKER.—A circuit-breaker takes the place of fuses in the lighting and ignition circuits.

Plate No. 476

SENECA

MODELS H, H2 AND L (1919-20)

ALLIS-CHALMERS GENERATING, STARTING AND LIGHTING SYSTEM CONNECTICUT IGNITION

BATTERY.—Prest-O-Lite, Type RHN-611, 6 volt, 80 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Breaker contacts separate .020 inch. They are made of tungsten. When the condition of the contacts effects the ignition, renew the inner breaker mechanism. For temporary service resurface contacts with fine emery cloth.

OILING.—Refill the grease cup under the distributor head with pure vaseline and turn down every month. If the car is driven more than 1000 miles in a month, this must be done every 1000 miles. Do not put grease or oil in the cup.

TIMING.—Breaker contacts begin to separate when the top dead center mark on the fly-wheel is 1/2 inch past the indicator, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 3, 4 2.

SPARK PLUG GAPS.—Spark plug gaps are .025 to .028 inch.

STARTER-GENERATOR.—Model No. MG9-L or MG16-L. The unit is permanently connected to the engine crankshaft. Acting as a starter, it cranks the engine at 50 R.P.M., taking 125-175 amperes.

Starter Data		
Torque	R.P.M.	Amperes
0 lb. ft.	1200	10
5 lb. ft.	600	110
10 lb. ft.	400	190
15 lb. ft.	260	265
20 lb. ft.	150	340
28 lb. ft.	Lock	450

GENERATOR.—Generator current regulation is by vibrating regulator. Maximum charging rate is 15 amperes, reached at 2000 R.P.M. of the armature or 20 miles per hour. Shunt field winding takes 2.5 amperes at 6-7 volts.

OILING.—Put 3 or 4 drops of light engine oil in each of the starter-generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles. Thoroughly clean out and repack bearings with soft cup grease once a year.

RELAY.—Relay closes at 10-12 miles per hour or 1000-1200 R.P.M. of the armature and opens at 8-10 miles per hour or 800-1000 R.P.M. of the armature. Relay contacts separate .030 inch. Air gap between relay armature and coil core is 1/16 inch. Clean relay and regulator contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before putting into service.

LAMPS.—Head lamps are 6-8 volt, 18 cp. Dash and tail lamps are 6-8 volt, 2 cp.

FUSE.—Fuse is 20 ampere.

Plate No. 477

GERONIMO

1918-19-20

DYNETO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

BATTERY.—Willard, 6 volt, 88 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Breaker contacts separate .018 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth, or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING.—Put 4 or 5 drops of light engine oil in the ignition unit oilers every two weeks. If the track of the rotor button in the distributor head is not well polished, apply a small amount of vaseline with a soft cloth. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .025 inch.

STARTER.—Model D-361, D-176 or D-190. Starter is connected to the engine through a Bendix drive.

Starter Data

Torque	R.P.M.	Amperes	Volts
0.0 lb. ft.	5600	25	6.4
2.5 lb. ft.	1400	150	5.8
5.0 lb. ft.	850	250	5.3
10.0 lb. ft.	250	420	4.6
14.0 lb. ft.	Lock	530	4.0

OILING.—Put several drops of light engine oil in the starter oilers every month.

GENERATOR.—Model C-354, C-176 or C-190. Generator current regulation is by the third brush system. Maximum current output of 14 amperes is reached at 16-18 miles per hour or 1500 R.P.M. of armature.

Generator Data

Amperes	M.P.H.	Volts
0	7-9	6.4
5	9-10	6.6
10	12-14	6.8
12-14	16-18	7.8
8	40-45	6.7

Charging rate may be varied by adjusting the third brush setting. Shunt field current is 3.5 amperes at 6.5 volts.

OILING.—Put 4 or 5 drops of light engine oil in the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 8-10 miles per hour or 450-500 R.P.M. of armature, and opens at 6-8 miles per hour or 400-450 R.P.M. of armature. Relay contacts separate 3/32 inch. Air gap between relay armature and coil core is 1/8 inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dash and tail lamps are 6-8 volt, 2 cp.

Plate No. 478

OLDSMOBILE

MODEL 45B (1920)

DELCO GENERATING, STARTING AND LIGHTING SYSTEM

DELCO IGNITION

BATTERY.—Willard, 6 volt, 80 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 2127. Distributor Model No. 5210. Breaker contacts separate .020 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING.—Put several drops of light engine oil in the upper distributor shaft bearing every two weeks. If the track of the rotor button in the distributor head is not well polished, apply a small amount of vaseline with a soft cloth. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when the piston entering the power stroke is on top dead center, spark control lever 2 inches from the top of the sector. (First see that the breaker assembly is fully retarded when the control lever is in the fully retarded position.)

FIRING ORDER.—The firing order is 1R, 4L, 3R, 2L, 4R, 1L, 2R, 3L.

SPARK PLUGS.—Diameter, $\frac{7}{8}$ inch. Spark gaps are .030 inch.

STARTER.—Model No. 178. Starter is connected to the engine through a Bendix drive. Lock torque is 14 pound-feet.

OILING.—Put 4 or 5 drops of light engine oil in the starter oilers every month.

GENERATOR.—Model No. 167. Generator current regulation is by the third brush system. Generator begins to supply current at 550 R.P.M. of the armature or 8 miles per hour. Maximum charging rate is 15 amperes, reached at 1200 R.P.M. of the armature or 18-24 miles per hour.

Amperes	Generator Data	R.P.M.
Neutral		550
4		800
8-10		1000
11-15		1200-1400
11-14		2000

Charging rate is varied by adjustment of the third brush setting. Adjustment is made by loosening the two holding screws on the third brush arm, and moving the brush. Move in the direction of the armature rotation to increase the charging rate and in the opposite direction to decrease the charging rate. Reseat the brush after the adjustment is made.

OILING.—Put 5 or 6 drops of light engine oil in the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—There is no relay. The circuit between the generator and the battery is controlled by the ignition switch.

LAMPS.—Head lamps are 6-8 volt, 15 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp.

CIRCUIT-BREAKER.—A vibrating circuit-breaker takes the place of fuses. It requires 25 amperes to start the vibrator, but 3-5 amperes will cause it to continue.

HARVARD 1920

DYNETO GENERATING, STARTING AND LIGHTING SYSTEM BOSCH IGNITION

Plate No. 479

BATTERY.—Prest-O-Lite, Type 611-RHN, 6 volt, 120 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Type DU-4. Breaker contacts separate .014 to .016 inch. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Put 2 or 3 drops of light machine oil in each of the magneto oilers every two weeks. Put a small amount of vaseline on the fiber bumper of the contact arm, applying with a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 3, 4, 2.

SPARK PLUGS.—Diameter, $\frac{7}{8}$ inch. Spark gaps are .030 inch.

STARTER.—Model D-366. Starter is connected to the engine through a Bendix drive. When cranking engine, starter takes 130 amperes, armature revolving at 1500 R.P.M.

Starter Data

Torque	R.P.M.	Amperes	Volts
0.0 lb. ft.	5600	25	6.4
2.5 lb. ft.	1400	150	5.8
5.0 lb. ft.	850	250	5.3
10.0 lb. ft.	250	420	4.6
14.0 lb. ft.	Lock	530	4.0

OILING.—Put several drops of light engine oil in the starter oilers every month.

GENERATOR.—Model No. C-306. Generator current regulation is by the third brush system. Maximum current output is 12-15 amperes, reached at 1200 R.P.M. of the armature or 20-25 miles per hour.

Generator Data

Amperes	Cold Test	R.P.M.	Amperes	Hot Test	R.P.M.
6		600	5		600
13		900	10		900
15		1200	12		1200
13.5		1600	11.5		1600
11.5		2000	10		2000

Shunt field current is 3.5 amperes at 6.5 volts. Charging rate is varied by adjustment of the third brush setting. Remove the leather plug in the commutator end of the generator, loosen the screw exposed and move in the direction of armature rotation to increase the charging rate. Move in the opposite direction to decrease the charging rate. Tighten the adjusting screw and replace the leather plug after adjustment is made.

OILING.—Put 4 or 5 drops of light engine oil in the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 8-10 miles per hour or 450-500 R.P.M. of armature, and opens at 6-8 miles per hour or 400-450 R.P.M. of armature. Relay contacts separate $\frac{3}{32}$ inch. Air gap between relay armature and coil core is $\frac{1}{8}$ inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

Plate No. 480

SAXON

MODEL Y-18-T (1920)

WAGNER GENERATING, STARTING AND LIGHTING SYSTEM

WAGNER IGNITION

BATTERY.—Prest-O-Lite, Type 611 RHN, 6 volt, 80 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Breaker contacts separate .020 to .025 inch. When the condition of the points affects the ignition, renew the breaker lever and contact screw.

OILING.—Screw up the grease cup under the breaker head one-half turn every two weeks. If car is driven more than 500 miles in two weeks, this must be done every 500 miles. Put 3 or 4 drops of light engine oil on the wick in the breaker lever spindle every six months.

TIMING.—Breaker contacts begin to separate when piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 4, 2, 6, 3, 5.

SPARK PLUG GAPS.—Spark plug gaps are .025 to .028 inch.

STARTER.—Model E.M.-167-A or 218. Starter is connected to the engine through a Bendix drive. Starter cranks the engine at 125 R.P.M., current being 160 amperes. Lock torque is 11.5 pound feet, current 475 amperes. Running freely, starter current is 60-90 amperes, armature revolving 8000 R.P.M.

OILING.—Put 5 or 6 drops of light engine oil in each of starter oilers every month.

GENERATOR.—Model E.M.-200, Type 41-Y, or Model E.M.-155, Type 41-W. Generator current regulation is by third brush system. Maximum current output of 15-16 amperes is reached at 20-22 miles per hour.

Generator Data

Model E.M.-200, Type 41-Y		Model E.M.-155, Type 41-W	
Amperes	R.P.M.	Amperes	R.P.M.
0	660	0	850
6	880	8	1225
12	1200	12	1500
15	1650	16	2100
11	2500	13	3000

OILING.—Put 5 or 6 drops of light engine oil in each of generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Model I-471. Relay closes at 8-10 miles per hour or 800-1000 R.P.M. of the armature, and opens at 6-8 miles per hour or 600-800 R.P.M. of the armature. Charging current is 2 amperes at closing, and the discharge current 0-4 amperes at opening of relay contacts. Contacts separate .035 to .065 inch. Air gap between relay armature (moving member) and coil core is .025 inch, contacts closed. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 15 cp. Dash lamp is 6-8 volt, 2 cp. Tail lamp is 6-8 volt, 2 cp.

FUSES.—Fuses are 15 ampere.

Plate No. 481

METZ MASTER SIX (1919-20) WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM CONNECTICUT IGNITION

BATTERY.—Willard, 6 volt, 120 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Breaker contacts separate .018 to .024 inch. They are made of tungsten. When the condition of the contacts affects the ignition, renew the inner breaker mechanism. For temporary service, resurface contacts with fine emery cloth.

OILING.—Refill the cup under the breaker head with pure vaseline and turn down every month. If the car is driven more than 1000 miles in a month, this must be done every 1000 miles. Do not put oil or grease in the cup.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUGS.—Diameter, $\frac{7}{8}$ inch. Spark gaps are .025 inch.

STARTER.—Frame No. 100.—Starter is connected to the engine through a Bendix drive. Starter cranks the engine at 125 R.P.M., taking 250 amperes. Lock torque is 12 pound-feet, current being 475 amperes at 4 volts. Running freely, starter takes 35-45 amperes, armature revolving 4000 R.P.M. or more.

OILING.—Put 5 or 6 drops of light engine oil in the starter oilers every month.

GENERATOR.—Frame No. 760. Generator current regulation is by the third brush system. Maximum current output is 15-17 amperes at 7.5 volts, reached at 1100-1500 R.P.M. of the armature or 25 miles per hour.

Generator Data		
Amperes	R.P.M.	Volts
0	500	6.5
8.0	750	7.0
15-17	1100-1500	7.5

Shunt field winding takes 2.5 amperes at 6 to 6.3 volts. Move the third brush in the direction of armature rotation to increase the charging rate, and in the opposite direction to decrease the charging rate.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted on the generator frame. Relay closes at 575-625 R.P.M. of the armature or 7-9 miles per hour and opens at 525-575 R.P.M. of the armature or 5-7 miles per hour. Adjust the spring tension on relay armature so that the contacts open with a discharge current of 0-3 amperes. Adjust the air gap between the relay armature and coil core so that the contacts close when the voltage of the generator reaches 6.2-6.5 volts. Air gap between relay armature and coil core is .005 inch, contacts closed. Contacts separate .030 to .035 inch. Resistance of the shunt coil is 68 ohms. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 16 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp.

Plate No. 482

METEOR

1920. 9N ENGINE

DELCO GENERATING, STARTING AND LIGHTING SYSTEM

DELCO IGNITION

BATTERY.—Battery is 6 volt, 90 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 2159. Breaker contacts separate .020 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING.—Put 4 or 5 drops of light engine oil in the ignition unit bearings every two weeks. If the track of the rotor button in the distributor head is not well polished, apply a small amount of vaseline with a soft cloth. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly one-third advanced.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

STARTER.—Model No 136. Starter is connected to the engine through a Bendix drive. Running freely, starter takes 35 amperes, armature revolving at 4500 R.P.M.

GENERATOR.—Model No. 135. Generator current regulation is by the third brush system.

OILING.—Starter bearings are of the oilless type.

Generator begins to supply current at 500 R.P.M. of the armature or 7-8 miles per hour, and reaches the maximum current output of 14-16 amperes at 1400 R.P.M. of the armature or 18-22 miles per hour.

Generator Data.

Amperes	Cold Test	R.P.M.	Amperes	Hot Test	R.P.M.
Neutral		500	Neutral		500
10.5-12.5		900	10-12		900
15.5-18.0		1400	14-16		1400
13.0-17.0		2000	11-13		2000

Charging rate is varied by adjusting the third brush setting. Loosen the two screws holding the third brush arm, and move in a counter-clockwise direction (looking at the commutator end) to increase the charging rate. Move the third brush in a clockwise direction to decrease the charging rate. Tighten the holding screws and reset the brush after adjusting position.

OILING.—Put 5 or 6 drops of light engine oil in the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—There is no relay. The generator-battery circuit is controlled by the ignition switch.

LAMPS.—Head lamps are 6-8 volt, 17 cp. Dash and tail lamps are each 6-8 volt, 2 cp.

CIRCUIT BREAKER.—A vibrating circuit breaker takes the place of fuses. It requires 25 amperes to start the vibrator. While vibrating, the current is 3.5 amperes.

KENWORTHY

MODEL 6-55 (1920)

WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM BOSCH IGNITION

BATTERY.—Exide, 6 volt, 140 ampere-hour. The negative (—) terminal is grounded.
IGNITION.—Type DU-6. Breaker contacts separate .0"4 to .016 inch. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Put 2 or 3 drops of light engine oil in the magneto oilers every two weeks. Put a small amount of vaseline on the fiber bumper of the contact arm, applying with a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUGS.—Diameter, $\frac{7}{8}$ inch. Spark gaps are .020 to .025 inch.

STARTER.—Frame No. 751. Starter is connected to the engine through a Bendix drive. Starter cranks the engine at 115-120 R.P.M.

Starter Data

Torque	R.P.M.	Amperes
2.5 lb. ft.	1450	140
7.5 lb. ft.	1150	200
12.5 lb. ft.	650	400
17.5 lb. ft.	500	530
21.0 lb. ft.	Lock	650

OILING.—Put 5 or 6 drops of light engine oil in the starter bearing oilers every month.

GENERATOR.—Frame No. 760.—Generator current regulation is by the third brush system. Maximum current output is 15-17 amperes, reached at 1250 R.P.M. of the armature or 16-20 miles per hour.

Generator Data

Amperes	Cold Test	R.P.M.	Amperes	Hot Test	R.P.M.
0		450	0		500
8		675	6		725
12		840	9		850
15-17		1250	12-14		1250
10		2000	7-8		2000

The cold test readings are obtained with a generator temperature under 95°F. The hot test readings are obtained after the generator has been operated one hour at 1800 R.P.M., charging a half-charged battery. Shunt field current is 2.8 to 3.25 amperes at 6 volts. When the generator is operating freely as a motor, current is 3.5 to 5 amperes at 6 to 6.6 volts.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted in the generator frame. Relay closes at 500-550 R.P.M. of the armature or 7.9 miles per hour and opens at 450-500 R.P.M. of the armature or 5-7 miles per hour. Adjust the spring tension on the relay armature so that the contacts open with a discharge current of 0-3 amperes. Adjust the air gap between the relay armature and coil core so that the contacts close when the voltage of the generator reaches 6.2 to 6.5 volts. Air gap between relay armature and coil core is .005 inch, contacts closed. Contacts separate .030 to .035 inch. Resistance of the shunt coil is 68 ohms. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dimmer and side lamps are 6-8 volt, 5 cp. Dash and tail lamps 6-8 volt, 2 c.p.

FUSES.—Fuses are 10, 15 and 30 ampere. (See diagram.)

Plate No. 483

NOMA **MODEL 1-B (1920). SERIAL NOS. 1 TO 595** **DELCO GENERATING, STARTING AND LIGHTING SYSTEM** **DELCO IGNITION**

Plate No. 484

BATTERY.—Willard, Type SJW-3, 6 volt, 104 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Breaker contacts separate .020 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING.—Put 3 or 4 drops of light engine oil in the ignition unit oilers every two weeks. If the track of the rotor button in the distributor head is not well polished, apply a small amount of vaseline with a soft cloth. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control one-third advanced.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .030 inch.

STARTER.—Model No. 181. Starter is connected to the engine through a Bendix drive. Lock torque is 7 pound-feet.

OILING.—Put 3 or 4 drops of light engine oil in the ignition unit oilers every two weeks.

GENERATOR.—Model No. 165. Rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. Maximum charging rate is 11-15 amperes, reached at 1200 R.P.M. of the armature, or 16-20 miles per hour.

Amperes	Generator Data	R.P.M.
Neutral		550
4		800
8		1000
11-15		1200
11-14		2000

Charging rate is varied by adjustment of the third brush setting. To move the third brush, loosen the three screws holding the bearing retainer plate on the commutator end and shift the plate. Move in a counter-clockwise direction to increase the charging rate, or in the opposite direction to decrease the charging rate. Tighten the adjusting screws and reseat the brush after making the adjustment. Maximum charging rate must not exceed 16 amperes.

OILING.—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted on the generator frame. Relay closes at 550-600 R.P.M. of the armature or 7-8 miles per hour, and opens at 500-550 R.P.M. of the armature or 5-6 miles per hour. Relay contacts separate .046 to .062 inch. Air gap between relay armature and coil core is .020 to .035 inch, contacts closed. To adjust relay, connect a voltmeter between the positive (+) generator brush and the ground. Then slowly speed up the generator and adjust the relay spring tension by turning the thumb nut, until the contacts close when the voltmeter indicates 7.5 volts. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 17 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp.

CIRCUIT BREAKER.—A vibrating circuit breaker takes the place of fuses. It requires 25 amperes to start the vibrator but 3-5 ampres will cause it to continue.

WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM ATWATER KENT IGNITION

BATTERY:—Willard (1919-20) Type SJRN-3, 6 volt, 90 ampere hour. (1921) Type SJRN-4, 6 volt, 120 ampere hour. The positive (+) terminal is grounded.

IGNITION:—Type CC. Breaker contacts separate .006 inch. They are made of tungsten. When the condition of the contacts affects the ignition remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone. Ignition current is 3.5-4 amperes, engine idle, breaker contacts and ignition switch closed.

OILING:—Remove the distributor cap every two weeks, and put 4 or 5 drops of light engine oil in the oil hole exposed. Apply a small amount of vaseline to the cam, with a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING:—Breaker contacts begin to separate when the top dead center mark on the fly-wheel is 2 inches past the indicator, spark control lever and breaker assembly midway between the fully retarded and fully advanced positions.

FIRING ORDER:—The firing order is 1, 2, 4, 3.

SPARK PLUG GAPS:—Spark plug gaps are .022 inch.

STARTER:—Frame 100. Starter is connected to the engine through a Bendix drive. Lock torque is 12 pound-feet, current being 475 amperes at 4 volts. Torque at 1600 R.P.M. is 1.75 pound-feet. Running freely, armature revolves at 4000 R.P.M., current being 50 amperes. Starter cranks the engine at 125 R.P.M., taking 140 amperes.

OILING:—Put 5 or 6 drops of light engine oil in each of starter bearing oilers every month.

GENERATOR:—Frame 760. Generator current regulation is by third brush system. Maximum current output is 15-17 amperes at 1250 R.P.M., of the armature or 20 miles per hour.

Cold Test		Generator Data		Hot Test	
Amperes	R.P.M.	Amperes	R.P.M.	Amperes	R.P.M.
0	450	0	500		
8	675	6	725		
12	840	9	850		
15-17	1250	11-13	1250		
10	2000	7-8	2000		

The cold test readings are obtained with a generator temperature under 95°F. The hot test readings are obtained after generator has been operated one hour at 1800 R.P.M., charging a half-charged battery. Shunt field current is 2.8 to 3.25 amperes at 6-6.6 volts.

OILING:—Put 5 or 6 drops of light engine oil in each of the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY:—Relay is mounted in generator frame. Relay closes at 450-500 R.P.M. of the armature or 7-9 miles per hour and opens at 400-450 R.P.M. of the armature or 5-7 miles per hour. Charging current is 1-2 amperes at closing, and the discharge current 0-2 amperes at the opening of relay. Contacts separate .013 to .018 inch. Air gap between relay armature (moving member) and coil core is .031 inch, contacts separated. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No.00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS:—Head lamps are 6-8 volt, 15 cp. Dash lamp is 6-8 volt, 2 cp. Tail lamp is 6-8 volt, 2 cp.

FUSES:—Generator field fuse is 5 ampere, short length. Horn and lighting circuit fuses are 10 ampere.

WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM WESTINGHOUSE AND BERLING IGNITION

McFARLAN
Twin-Valve Six (1921) Westinghouse Generating,
Starting and Lighting System
Westinghouse and Berling Ignition

Plate No. 488

BATTERY.—Willard, 6 volt, 120 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Westinghouse, Type SC. Breaker contacts separate .012 to .016 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone. The bumper on the contact spring is $\frac{1}{8}$ inch off center from the line through the centers of the shaft and terminal screw, this offset being opposite to the direction of rotation of the cam. The above adjustment is made by bending the solid arm at the terminal block. A pull of 20-25 ounces, applied to the movable contact, is required to separate the contacts .020 inch. The spring pressure is adjusted by bending the solid arm at the point of contact with the contact spring. Resistance of the primary winding of the ignition coil is 1 ohm. The resistance of the ballast resistor is .4 ohm. Resistance of the secondary winding is 4700 ohms.

IGNITION.—Berling, Two-Spark. Breaker contacts separate .016 to .020 inch. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Put 10 drops of light engine oil in each oil cup every month. Put a small amount of vaseline on the cam and on the two rubbing surfaces of the fiber lever, applying with a toothpick. If the car is driven more than 1000 miles in a month, these attentions must be given every 1000 miles.

TIMING.—Battery breaker contacts begin to separate when the top dead center mark on the flywheel rim is $\frac{1}{2}$ inch before the indicator, and magneto breaker contacts begin to separate when the dead center line on the flywheel is at the indicator, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUGS.—Diameter, $\frac{7}{8}$ inch. Spark gaps are .025 inch.

STARTER.—Frame No. 777. Starter is connected to the engine through a magnetically shifted pinion. The starting switch is also of the magnetic type, controlled by a push button on the dash. Lock torque is 27.5 pound-feet, current 750 amperes at 4 volts. Torque at 1250 R.P.M. is 3.5 pound-feet, current 230 amperes at 5.5 volts. Running freely, armature revolves at 5000 R.P.M., current 80 amperes at 5.5 volts. Brush pressure is $2\frac{1}{2}$ to 3 pounds. Pinion must be pulled into mesh by a current of 125 amperes or less, and must not be held in by 80 amperes. With the plunger in the "In" position, the air gap between the plunger and the cover of the pull-in coil is $\frac{5}{16}$ inch, including the micarta washer. With the plunger in the "In" position, the spring is compressed into an over-all length of $1\frac{11}{16}$ inches, and exerts a pressure of 7 pounds. With the plunger in the "Out" position, the spring measures $2\frac{13}{16}$ inches and exerts a pressure of 2 pounds. Pressure of brushes on commutator is 2.5 to 3 pounds.

OILING.—Put 5 or 6 drops of light engine oil in each of the starter oilers every month.

GENERATOR.—Frame 781-R. Generator voltage regulation is by vibrating regulator. Maximum charging rate is 20 amperes, reducing as the battery becomes charged. Shunt field winding takes 1.25 to 1.75 amperes at 6 to 6.3 volts. Running freely as a motor, generator takes 5 amperes at 6 to 6.3 volts.

OILING.—Put 5 or 6 drops of light engine oil in the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY-REGULATOR.—Relay closes at 425-450 R.P.M. of the armature or 6-7 miles per hour and opens at 400-425 R.P.M. of the armature or 5-6 miles per hour. Adjust relay spring tension so that the contacts open with a discharge current of 1 to 2 amperes from the battery. Adjust air gap between relay armature and coil core so that the contacts close when the voltage of the generator reaches 6.5 to 7 volts, battery disconnected. Air gap between relay armature and coil core is .055 to .060 inch. Air gap between regulator armature and coil core is .045 to .055 inch. Adjust regulator to limit the voltage to 6.5 volts with a 20 ampere resistance load, generator being driven at 1200 R.P.M. Clean relay and regulator contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 32 cp. Dimmer lamps are 6-8 volt, 12 cp. Tail and dash lamps are 6-8 volt, 2 cp.

AMERICAN MODEL C-6 (1920-21)

GRAY & DAVIS GENERATING, STARTING AND LIGHTING SYSTEM

BATTERY.—Willard, 6 volt, 90 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Breaker contacts separate .018 to .024 inch. They are made of tungsten. When the condition of the contacts affects the ignition, renew the inner breaker mechanism. For temporary service, resurface contacts with fine emery cloth.

OILING.—Refill the cup under the breaker head with pure vaseline and turn down every month. If the car is driven more than 1000 miles in a month, this must be done every 1000 miles. Do not put grease or oil in the cup.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 4, 2, 6, 3, 5.

SPARK PLUGS.—Diameter, $\frac{7}{8}$ inch. Spark gaps are .025 to .030 inch.

STARTER.—Model No. 521. Rotation is counter-clockwise, looking at the commutator end. Starter is connected to the engine through a Bendix drive. Starter cranks the engine at 150-225 R.P.M., taking 150 amperes. Lock torque is 15 pound-feet at 3.5 volts.

Starter Data		
Torque	R.P.M.	Amperes
0 lb. ft.	4500	45
1 lb. ft.	2100	100
2 lb. ft.	1600	135
6 lb. ft.	900	260
8 lb. ft.	650	320

Pressure of the brushes on the commutator is 2.5 to 3.5 pounds.

OILING.—Put 5 or 6 drops of light engine oil in the starter oilers every month.

GENERATOR.—Model No. 605. Rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. Maximum charging rate is 15 amperes, reached at 1400 R.P.M. of the armature or 25 miles per hour.

Amperes	Generator Data	R.P.M.
0		460
4		580
8		720
10		820
12		940
15		1400
12		2600

Charging rate is varied by adjustment of the third brush setting. Adjustment is made by turning the pinion screw, located between the fuse and relay at the front end of the generator. Turn the adjusting screw to the left (facing commutator end of the generator) to increase the charging rate and to the right to decrease the charging rate. Shunt field winding takes 2.6 amperes at 6 volts. Pressure of brushes on the commutator. Pressure of brushes on the commutator is $1\frac{1}{4}$ to $2\frac{1}{4}$ pounds.

OILING.—Put 5 or 6 drops of light engine oil in the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 460-500 R.P.M. of the armature or 10 miles per hour and opens at 420-460 R.P.M. of the armature or 8 miles per hour. Relay contacts separate .015 to .018 inch. Air gap between relay armature and coil core is .030 inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 15 cp. Dimmer lamps are 6-8 volt, 5 cp. Dash and tail lamps are 6-8 volt, 2 cp.

FUSES.—Fuses are 20 amperes.

AUBURN
MODEL 6-39
REMY SYSTEM

Plate No. 490

AUBURN

MODEL 6-39 (1921)

REMY GENERATING, STARTING AND LIGHTING SYSTEM

REMY IGNITION

BATTERY:—Willard, 6-39-A Type SLW-3, 6 volt, 80 ampere hour (6-39). Type S J W N 3, 6 volt, 90 ampere hour. The positive (+) terminal is grounded.

IGNITION:—Breaker contacts separate .020 to .025 inch. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

Oiling:—Refill the grease cup under the distributor head with soft cup grease and turn down two turns every two weeks. Put a small amount of vaseline on the fiber bumper of the contact arm, applying with a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

Timing:—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

Firing Order:—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps:—Spark plug gaps are .030 inch.

STARTER:—Model No. 705-A. Direction of rotation looking at commutator end is counter clockwise. Starter is connected to the engine through a Bendix drive. Starter cranks the engine at 105 R.P.M.

Starter Data

Torque	R.P.M.	Amperes	Volts
4 lb. ft.	1000	175	5.1
8 lb. ft.	625	280	4.6
12 lb. ft.	350	365	4.3
16 lb. ft.	225	450	3.9
20 lb. ft.	100	510	3.6
24 lb. ft.	Lock	580	3.3

Oiling:—Put 4 or 5 drops of light engine oil in each of the starter oilers about every 2500 miles.

GENERATOR:—Models 911-A & 913-A. The direction of rotation looking at commut. end is clockwise. Generator current regulation is by the third brush system. A thermostat, located in the brush rigging of the generator, cuts a resistance into the shunt field circuit at a temperature of 175° F., reducing the maximum charging rate 9 amperes. The thermostat is intended to regulate the charging rate as demands of the seasons or car operations requires. Never touch the thermostat points. Maximum current output is 20 amperes, reached at 1800 R.P.M. of the armature or 25 miles per hour.

0	580
4	700
8	860
12	1040
16	1260
20	1800
16	2800

Charging rate is varied by adjusting third brush setting. Third brush is moved by turning a small screw exposed in the commutator end plate. Move the third brush in the direction of armature rotation to increase the charging rate and in the opposite direction to decrease the charging rate. Reseat the brush after adjusting position.

Oiling:—Put 4 or 5 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY:—Relay closes at 8-10 miles per hour or 580-640 R.P.M. of the armature and opens at 6-8 miles per hour or 520-560 R.P.M. of the armature. Relay contacts separate .020 inch. Clean contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS:—Head lamps are 6-8 volt, 20 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp. On the Model E-39A, head lamps are 6-8 volt, 15 cp.

DELCO GENERATING, STARTING AND LIGHTING SYSTEM

DELCO IGNITION **7-R CONTINENTAL ENGINE**
BATTERY—Exide, Type 364, 6 volt, 110 ampere-hour. The negative (—) terminal is grounded.

IGNITION—Coil Model No. 2159. Distributor Model No. 5208. Breaker contacts separate .020 to .0275 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface against the flat side of an emery wheel, finishing on a hard oil stone.

Oiling—Put 3 or 4 drops of light engine oil in each of the distributor oilers every two weeks. Fill the distributor housing, to a level above the advance ring and yoke, with light cup grease once each season. If the track of the rotor button is not well polished, apply a very small amount of vaseline.

Timing—Breaker contacts begin to separate when the piston of the first cylinder is on top dead center of power stroke, spark control lever and breaker assembly in the fully retarded position.

Firing Order—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps—The spark plug gaps are .025 inch.

STARTER—Model No. 181. Starter is connected to the engine through a Bendix drive. Lock torque is 28 pound-feet, the current being 525 amperes at 4 volts.

Oiling—Put 4 or 5 drops of light engine oil in each of the starter bearing oilers every month. Remove the grease plug in the reduction gear housing and inject soft cup grease every six months.

GENERATOR—Model No. 165. Generator current regulation is by the third brush system. Maximum charging rate is 11-15 amperes, reached at 1200 R.P.M. of the armature, or 16-20 miles per hour.

Amperes	Generator Data	R.P.M.
0		550
4		800
8		1000
11-15		1200
11-14		2000

To move the third brush, loosen the three screws holding the bearing retainer plate on the commutator end and shift the plate. Move in the same direction as armature turns to increase the charging rate, or in the opposite direction to decrease the charging rate. Maximum charging rate must not exceed 16 amperes.

Oiling—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY—Relay is mounted on the generator frame. Relay closes at 550-600 R.P.M. of the armature or 7-8 miles per hour, and opens at 500-550 R.P.M. of armature or 5-6 miles per hour. Relay contacts separate .046 to .062 inch. Air gap between the relay armature and coil core is .020 to .035 inch, contacts closed. To adjust relay connect a voltmeter between the positive (+) generator brush and ground. Then slowly speed up the generator and adjust the relay spring tension by turning the thumb nut until the contacts close when the voltmeter indicates 7.5 volts. Clean relay contacts by drawing unglazed between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS—Head lamps are 6-8 volt, 20 cp. Dimmer lamps are 6-8 volts, 5 cp. Dash and tail lamps are 6-8 volts, 2 cp. Side lamps are 6-8 volts, 4 cp. Parking lamps are 6-8 volts, 4 cp.

CIRCUIT BREAKER—A vibrating circuit breaker takes the place of fuses. It requires a current of 25 amperes to start the vibrator, but 3-5 amperes will cause it to continue.

Plate No. 492

CADILLAC MODEL 59 (1920-1921) DELCO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

BATTERY.—Exide, 6 volt, 130 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Coil Model No. 2115. Distributor Model No. 5206. Breaker contacts separate .020 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

Oiling.—Remove the breather pipe at the rear of the distributor housing and pack the gear compartment with soft cup grease every 2000 miles.

Timing.—Breaker contacts begin to separate when piston on compression stroke is 1 21/32 inches in advance of top center, spark control lever and breaker assembly in the fully advanced position. On the Model 59 (1920) cars, breaker contacts begin to separate when the flywheel marking "1-GA" is at the indicator, No. 1 piston of the left hand block entering power stroke, and the spark control lever and breaker assembly fully retarded.

Firing Order.—The firing order is 1L, 2R, 3L, 1R, 4L, 3R, 2L, 4R.

Spark Plug Gaps.—Spark plug gaps are .023 inch.

STARTER-GENERATOR.—Model No. 162. The direction of rotation looking at commutator end is clockwise. The starter cranks the engine at 90-100 R.P.M., taking 140-150 amperes. The starter is connected to the engine through a set of reduction gears meshed by the operator.

GENERATOR.—Generator current regulation is by the third brush system. Generator begins to supply current at 7 miles per hour, and reaches the maximum current output of 16 amperes at 25 miles per hour or 1500 R.P.M. of the armature. Charging rate is varied by adjustment of the third brush setting. To move the third brush, first loosen the clamp nut on the front end of the generator one or two turns. Remove the cover band over the brushes and turn the third brush adjusting screw. Turn in a clockwise direction to increase the charging rate and in a counter clockwise direction to decrease the charging rate. Reseat the brush and tighten the clamp after the adjustment is made.

Oiling.—Put 4 or 5 drops of light engine oil in each of the starter-generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—There is no relay. The circuit between the generator and battery is controlled by the ignition switch.

LAMPS.—Head lamps are 6-8 volt, 18 cp. Side and dome lamps are 6-8 volt, 2 cp. Dash and tail lamps are 3-4 volt, 2 cp. On the 1920 cars, the side and dome lamps are 6-8 volt, 6 cp.

CIRCUIT-BREAKER.—A vibrating circuit-breaker takes the place of fuses. It requires 25 amperes to start the vibrator, but 3-5 amperes will cause it to continue.

Plate No. 493

FRANKLIN

SERIES 9-B (1919-20-21)

DYNETO GENERATING, STARTING AND LIGHTING SYSTEM ATWATER KENT IGNITION

BATTERY.—Willard, Type SXR-27, 12 volt, 60-ampere-hour. The two-wire system is used.

IGNITION.—Type K2. Breaker contacts separate .010 to .012 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone. There is also a master vibrator connected into the primary circuit, controlled by a separate switch, intended to produce easy starting. It takes 1.1 amperes when operating from a fully charged battery.

OILING.—Put a drop of light machine oil on each of the 3 wearing points of breaker and put 4 or 5 drops of light machine oil in the oil hole beside the notched shaft every two weeks. Put a very small amount of vaseline on the notched shaft, applying with a toothpick, at the same time. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts separate when the top dead center mark "C.L." $\frac{1-6}{1-6}$ on the fly-wheel is $1\frac{1}{2}$ inches before the indicator, breaker fully retarded. Spark control is automatic.

FIRING ORDER.—The firing order is 1, 4, 2, 6, 3, 5.

SPARK PLUG GAPS.—Spark plug gaps are .032 inch.

STARTER-GENERATOR.—Type K1R. Armature shaft is chain-connected to the engine crankshaft. Starter cranks the engine at 144 R.P.M., taking 64 amperes. Lock torque is 32 pound-feet, current being 208 amperes. Running freely, the starter takes 10 amperes, armature revolving at 600 R.P.M.

GENERATOR.—Generator current regulation is by the third brush system. Generator begins to supply current at 850 R.P.M. of the armature or 10 miles per hour. Maximum output is 12-14 amperes at 14.5 volts, reached at 1650 R.P.M. of the armature or 20 miles per hour.

Generator Data

Amperes	R.P.M.	M.P.H.
0	850	10
5	975	12
12-14	1650	20
8	4000	45

Shunt field winding takes 4-6 amperes at 14 volts. Pressure of brushes on commutator is 4-6 pounds.

OILING.—Put 5 or 6 drops of light engine oil in each of the starter-generator two weeks. If the car is driven more than 500 miles in two weeks, done every 500 miles.

RELAY.—There is no relay. The circuit between the generator and battery is by the starting switch.

LAMPS.—Head lamps are 12-16 volt, 21 cp. Dimmer lamps and tail lamps are 12-16 volt, 2 cp. On 1920 cars head

FUSES.—Fuses are 10 ampere.

Plate No. 494

BRISCOE
MODEL 4-34 (1920-21)

AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM CONNECTICUT IGNITION

BATTERY.—Presi-O-Lite, Type 613-WHN-2, 6 volt, 80 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Connecticut, Model 16, clockwise rotation. Breaker contacts separate .020 inch. They are made of tungsten. When the condition of the contacts affects the ignition, renew the inner breaker mechanism. For temporary service, resurface contacts with fine emery cloth.

OILING.—Refill the cup under the breaker head with pure vaseline and turn down every month. If the car is driven more than 1000 miles in a month, this must be done every 1000 miles. Do not put grease or oil in the cup.

TIMING.—Breaker contacts begin to separate when the top dead center mark on the flywheel is 1½ inches past the indicator, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 3, 4, 2.

SPARK PLUG GAPS.—Spark plug gaps are .025 inch.

STARTER.—Model MG-1013. Starter is connected to the engine through a Bendix drive. Running free at 4000 R.P.M., taking 40-60 amperes, 6 volts. Cranking the engine at 125 R.P.M., taking 150 amperes, 5 volts. Lock torque, 13 pound-feet, taking 450 amperes, 3-4 volts.

Starter Data

Torque	R.P.M.	Amperes
2 lb. ft.	1280	135
4 lb. ft.	900	210
6 lb. ft.	600	275
8 lb. ft.	400	335
10 lb. ft.	180	390
13 lb. ft.	Lock	450

OILING.—Put 4 or 5 drops of light engine oil in each of the starter bearing oilers every month.

GENERATOR.—Model GJ-1013. Generator current regulation is by third brush system. Maximum output is 12-16 amperes, reached at 1700 R.P.M. of the armature or 22 miles per hour.

[illegible]

Amperes	R.P.M.	Amperes	R.P.M.
0 _____	500	0 _____	460
8 _____	750	6 _____	840
12 _____	960	9 _____	1050
16 _____	1400	12 _____	1360
16.5 _____	1700	12.7 _____	1700
12 _____	3400	10 _____	3400

Above readings are obtained with generator charging a battery of 1.300 solution.

Oiling.—Repack timer drive housing with arctic cup grease once every season. If car is driven over 5000 mjes in one season, this care must be given to every 5000 miles. Do not use oil as it will dirty the commutator. The front bearing is automatically lubricated from the timing gears.

RELAY.—Relay closes at 9 miles per hour or 580 R.P.M. of armature and opens at 7 miles per hour or 360 R.P.M. of armature. Relay contacts separate .030 to .045 inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dash lamp is 6-8 volt, 2 cp. Tail lamp is 6-8 volt, 2 cp.

FUSES.—Fuses are 20 ampere.

CHANDLER
MODEL 'NS'
GRAY & DAVIS STARTER & GENERATOR
BOSCH IGNITION,

CHANDLER NEW SERIES (1920-21) GRAY AND DAVIS GENERATING, STARTING AND LIGHTING SYSTEM BOSCH MAGNETO IGNITION

- BATTERY.**—Prest-O-Lite, 6 volt, 105 ampere-hour. The positive (+) terminal is grounded.
- IGNITION.**—Type B-6. Breaker contacts separate .015 inch. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.
- OILING.**—Put 2 or 3 drops of light engine oil in each of the magneto oilers every month. Apply a small amount of vaseline to the fiber bumper of the contact arm, with a toothpick. If the car is driven more than 1000 miles in a month, these attentions must be given every 1000 miles.
- TIMING.**—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.
- FIRING ORDER.**—The firing order is 1, 5, 3, 6, 2, 4.
- SPARK PLUG GAPS.**—Spark plug gaps are .025 inch.
- STARTER.**—Model No. 504. Starter is connected to the engine through a Bendix drive. Lock torque is 12 pound-feet, current being 450 amperes. Starter cranks the engine at 120 R.P.M., taking 125 amperes.
- OILING.**—Put 5 or 6 drops of light engine oil in each of the starter bearing oilers every month.
- GENERATOR.**—Model No. 607. Generator current regulation is by third brush system. Maximum charging rate is 12-15 amperes at 18-20 miles per hour. Charging rate is varied by turning a screw, located on the lower right side of the commutator end plate. Turning this screw shifts the third brush assembly through a rack and pinion movement. Turn the screw in a clockwise direction (looking at commutator end) to increase the charging rate and in a counter-clockwise direction to decrease the charging rate.
- OILING.**—Put 5 or 6 drops of light engine oil in each of the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.
- RELAY.**—Relay is mounted on generator frame. Relay closes at 8-10 miles per hour, or 500-550 R.P.M. of the armature and opens at 6-8 miles per hour or 450-500 R.P.M. of the armature. Charging current is 1-2 amperes at closing, and the discharge current 0-2 amperes at opening of relay. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.
- LAMPS.**—Head lamps are 6-8 volt, 18 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash lamp is 6-8 volt, 2 cp. Tail lamp is 6-8 volt, 2 cp.
- FUSES.**—Fuses are 20 ampere.

MODELS 34-B (1920) AND 34-C (1921)

REMY GENERATING, STARTING AND LIGHTING SYSTEM

REMY IGNITION

BATTERY.—Prest-O-Lite, 6 volt, 100 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 284-C. Distributor Model No. 356-C. Breaker contacts separate .022 inch. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Refill the grease cup under the distributor head with soft cup grease and turn down two turns every two weeks. Put a small amount of vaseline on the fiber bumper of the contact arm, applying with a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when the top dead center mark on the fly-wheel is 1/2 inch past the indicator, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUGS.—Diameter, 7/8 inch. Spark gaps are .025 to .030 inch.

STARTER.—Model No. 701-A. Starter is connected to the engine through a Bendix drive.

Starter Data			
Torque	R.P.M.	Amperes	Volts
0 lb. ft.	10,000	65	5.7
2 lb. ft.	2250	175	5.1
6 lb. ft.	750	365	4.2
10 lb. ft.	225	500	3.5
12 lb. ft.	Lock	575	3.2

Above tests are made without gear reduction. Pressure of brushes on the commutator is 20-24 ounces.

OILING.—Put 5 or 6 drops of light engine oil in each of the starter oilers every month.

GENERATOR.—Model 911-A. Generator current regulation is by the third brush system. A thermostat, located in the brush rigging of the generator, cuts a resistance into the shunt field circuit of the generator at a temperature of 175°F., reducing the maximum charging rate 8 amperes. Never touch the thermostat points. Maximum charging rate is 20 amperes with the thermostat closed, reached at 1800 R.P.M. of the armature or 25 miles per hour.

Generator Data			
Cold Test. Thermostat Closed		Hot Test. Thermostat Open	
Amperes	R.P.M.	Amperes	R.P.M.
0	600	0	800
5	750	4	1100
10	950	6	1250
15	1200	8	1450
20	1800	11	2000
14	3200	9	3200

Charging rate is varied by adjustment of the third brush setting. Third brush assembly is moved by turning a screw exposed in the commutator end plate. Pressure of main brushes on the commutator is 17-20 ounces. Pressure of the third brush is 13-17 ounces.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 8-10 miles per hour or 600-650 R.P.M. of the armature and opens at 6-8 miles per hour or 550-600 R.P.M. of the armature. Relay contacts separate .020 inch. Air gap between relay armature and coil core is .020 inch, contacts closed. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 15 cp. Dimmer lamps are 6-8 volt, 5 cp. Dash and tail lamps are 6-8 volt, 2 cp.

Plate No. 497

CHEVROLET

MODEL 4-90 (1919-20-21)

AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM REMY IGNITION

BATTERY.—Willard, Type SJW-3, 6 volt, 80 ampere-hour. The negative (—) terminal is grounded at the starting motor.

IGNITION.—Breaker contacts separate .030 inch. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Refill the grease cup under the breaker head with soft cup grease and turn down two turns every two weeks. Put a small amount of vaseline on the fiber bumper of the contact arm, applying with a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when the piston entering the power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 2, 4, 3.

SPARK PLUG GAPS.—Spark plug gaps are .030 inch.

STARTER.—Model MF. Rotation is counter-clockwise, looking at the commutator end. Starter is connected to the engine through a Bendix drive. Starter cranks the engine at 75 R.P.M., taking 150 amperes.

OILING.—Thoroughly clean out and repack the starter bearings with soft cup or ball-bearing grease, reached at 1800-2250 R.P.M. or 25 miles per hour.

GENERATOR.—Model GH. Rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. Maximum charging rate is 16 amperes, reached at 1800-2250 R.P.M. or 25 miles per hour. Maximum charging ing grease every six months.

Generator Data

Amperes	R.P.M.	Volts
0	550	6.25
4	720	6.6
8	900	7.0
12	1150	7.4
16	1700	7.9
16.4	2000	8.0
15	2500	7.8

Charging rate is varied by adjustment of the third brush setting. Move the third brush in a counter-clockwise direction, looking at the commutator end, to increase the charging rate and in the opposite direction to decrease the charging rate. Reseat the brush after adjusting the position. Operating freely as a motor, generator takes 2.7 amperes, armature revolving at 450 R.P.M. Shunt field winding takes 1.7 amperes.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 550-600 R.P.M. of the armature or 8-10 miles per hour and opens at 500-550 R.P.M. of the armature or 6-8 miles per hour. Charging current is 5 to 1.5 amperes at closing and the discharge current 0-1 ampere at the opening of the relay contacts. Clean the relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface them with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 15 cp. Tail lamp is 6-8 volt, 2 cp.

10	950	6	1250
15	1200	8	1450
20	1800	11	2000
14	3200	9	3200

Charging rate is varied by adjustment of the third brush setting. The third brush assembly is moved by turning a screw exposed in the commutator end plate. Pressure of main brushes on the commutator is 17-20 ounces. Pressure of the third brush is 13-17 ounces.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted on the generator frame. Relay closes at 8-10 miles per hour or 600-650 R.P.M. of the armature, and opens at 6-8 miles per hour or 550-600 R.P.M. of the armature. Relay contacts separate .012 to .015 inch. Air gap between relay armature and coil core is .012 to .015 inch, contacts closed. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 15 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp.

WILLS SAINT CLAIRE

MODEL A-68 (1922)

DELCO GENERATING, STARTING AND LIGHTING SYSTEM

DELCO IGNITION

BATTERY.—Willard, Type SJRN-5 6 volt, 132 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Coil Model 2178. Distributor Model 5235. Breaker contacts separate .020-.025 inch. They are made of tungsten. Resurface contacts on a medium hard oil-stone. Two sets of contacts are provided. They operate with a four sided cam and open separately. Each breaker cam controls one coil and fires one bank of cylinders. The distributor is provided with manual and automatic advance. Manual advance is 45-50°. Automatic advance begins at 500 R.P.M. and reaches a maximum of 19-22° at 2000 R.P.M. The breaker arm spring tension is 16-20 ounces.

Oiling.—Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor housing every 500 miles or each two weeks. Put a small bit of medium heavy grease on the breaker cam and on the track in the distributor head every 1000 miles. After polishing the rotor track with a clean cloth, remove all excess grease.

Timing.—Breaker contacts firing right bank of cylinders begin to separate when piston No. 1 entering power stroke reaches a position 7° past top dead center (measured on flywheel) with the spark control lever and breaker assembly in the fully retarded position. This position is reached when the flywheel marking EC-1 is slightly past the indicator. Breaker contacts firing the left bank open when piston No. 8 reaches a similar position. The engine fires at intervals of 60 and 120° corresponding to 30 and 60° of distributor travel. These intervals must be accurately set. This may be done by connecting a test lamp in each circuit and noting the exact moment the contacts separate. If small scratches are made on the distributor housing opposite the rotor when the contacts separate the firing intervals can be measured. The straight line distances between the marks should be 1 1/16" for the 30° and 2 1/32" for the 60° intervals.

Firing Order.—The firing order is 1, 8, 3, 6, 4, 5, 2, 7.

Spark Plugs.—Spark plug diameters are 7/8 inch. Gaps are .025 inch.

STARTER GENERATOR.—Model 207. Starter cranks the engine at 100 R.P.M. Current required to break away is 265 amperes. While cranking starter draws 50-75 amperes. Rotation is clockwise, looking at the commutator end.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	Free	6	60
10 lb. ft.	Lock	3	—

GENERATOR.—Generator current regulation is by the third brush system. Thermostat opens 190-200° F., cuts in Res., reducing charging rate 50 per cent.

Generator Data—No. 207

Amperes	Cold	R.P.M.	Amperes	Hot	R.P.M.
0	575-600	0	750-800		
8-10	1000	1-2	1000		
16-18	1500	6-8	1500		
18-20	2400	11-13	2400		

To adjust the charging rate, loosen cover band and locknut on the generator commutator end and shift the third brush mounting plate by means of the handle. To increase the charging rate shift the third brush in the direction of armature rotation and in the opposite direction to decrease the charging rate. Tighten the locknut after making the adjustment.

Oiling.—Put 8 or 10 drops of light engine oil in each of the starter-generator oilers every 500 miles. Every 1000 miles apply heavy grease to starting gear shaft through fitting in rear end of shaft and apply heavy oil to the generator clutch through oiler in top of housing. Once each year remove, disassemble and clean generator and motor clutches. Repack with vaseline.

RELAY.—There is no relay. The circuit between the battery and generator is controlled by the ignition switch.

LAMPS.—Head lamps are 6-8 volt, 18 cp. Dash and tail lamps are 6-8 volt, 2 cp. Dimmer lamps are 6-8 volt, 2 cp. All are single contact.

FUSES.—A vibrating circuit breaker takes the place of fuses. It requires a current of 25-30 amperes to start this device. While vibrating the current is 10-15 amperes.

Plate No. 499

Plate No. 500

PACKARD

MODELS 3-25 AND 3-35 (1919-20-21)

BJUR GENERATING, STARTING AND LIGHTING SYSTEM

DELCO IGNITION

BATTERY.—Willard, Type S.M.-7, 6 volt, 120 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Coils Model No. 2150. Distributor Model No. 5161. Breaker contacts separate .015 to .020 inch. To clean contacts, put a drop of oil on each pair while engine is in operation. Run the engine until the violent sparking caused by the oil ceases. Stop the engine and clean the contacts thoroughly with gasoline. If condition of breaker points affects ignition, remove and resurface on a medium hard oilstone.

OILING.—Put 8-10 drops of light engine oil in each of the ignition unit oilers every month. If the car is driven more than 1000 miles in a month, the oiling must be done every 1000 miles. Once a season remove the top and lower plates at the rear of the distributor housing and repack with vaseline.

TIMING.—Breaker contacts on the right-hand side begin to separate when the flywheel marking "S.R." is at the indicator, spark control lever and breaker assembly in the fully advanced position. This is the firing position for No. 1 cylinder of the right-hand block. Breaker contacts on the left-hand side begin to separate when the flywheel marking "S.L." is at the indicator, spark control lever and breaker assembly in the fully advanced position. This is the firing position for No. 1 cylinder of the left-hand block.

FIRING ORDER.—The firing order is 1R, 6L, 4R, 3L, 2R, 5L, 6R, 1L, 3R, 4L, 5R, 2L.

SPARK PLUG GAPS.—Spark plug gaps are .032 inch.

STARTER.—Type E.D.-160, M-1041. Rotation is clockwise, looking at commutator end. Starter is connected to the engine through a Bijur automatic pinion shift. Starter cranks the engine at 120 R.P.M., current 200 amperes.

OILING.—Fill the starter oilers with light engine oil once a month.

GENERATOR.—Type K-646, M-718. The direction of rotation is counter-clockwise, looking at commutator end. Generator regulation is by a vibrator-relay-regulator. The maximum charging rate is 15-18 amperes, decreasing to 4-6 amperes as battery becomes charged. The Maximum charging rate is reached at 1000-1400 R.P.M. of armature or 20 miles per hour, car speed at high gears.

Generator Test Data

Amperes	R.P.M.
0	350
Max. 15-18	750

Generator motoring freely at 3-5 amperes, 6 volts. Field test—1.2-1.4 amperes, 7.75 volts, generator operating.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY-REGULATOR.—Relay and regulator are contained in an aluminum case, mounted on top of the generator frame. Adjustments are made through two holes in the side of the case. Relay closes at 8 miles per hour, or 450-500 R.P.M. of the armature, and opens at 7 miles per hour or 400-450 R.P.M. of the armature. Relay contact should close when the voltage of the generator reaches 6.5 volts. To adjust the relay remove the disconnecting plug and insert the adjusting wrench in the hole nearest the plug end and make a trial adjustment of the spring tension. Turn the wrench to the right to raise the cut-in voltage and to the left to decrease the cut-in voltage. Replace the plug and ascertain the result of the adjustment. Continue making trial adjustments in this manner until the desired relay action is obtained. Be sure that the disconnecting plug is always removed before inserting the wrench in the adjusting hole, or a direct short-circuit of the battery is liable to occur. Adjust the regulator in the same manner, making trial adjustments with the plug removed until the specified action is obtained. To adjust the regulator, the generator must be driven at 1000-1400 R.P.M., charging a battery of 1.250 solution, or higher. The regulator must be adjusted to limit the voltage of the generator to 7.75 volts. Turn the adjusting nut to the right to raise the voltage and to the left to lower the voltage.

LAMPS.—Head lamps are 6-8 volt, 24 cp. Dimmer lamps are 6-8 volt, 6 cp. Instrument, inspection, side, tonneau, pillar, rear quarter and rear baggage compartment lamps are each 6-8 volt, 4 cp. Dome lamp is 6-8 volt, 12 cp., gas-filled. Tail lamp is 6-8 volt, 2 cp. All lamps have a single contact base.

FUSES.—Fuses are 10 ampere.

Plate No. 501

WINTON

MODEL 25 (1920-21) SERIAL NOS. 1 UP. BIJUR GENERATING, STARTING AND LIGHTING SYSTEM BOSCH MAGNETO IGNITION

BATTERY.—Willard, Type SJR-5, 6 volt, 139 ampere-hour. The positive (+) terminal is grounded at the starting motor.

IGNITION.—Type DU6. Breaker contacts separate .014 to .016 inch. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Put 2 or 3 drops of light machine oil in each of the magneto oilers every two weeks. Put a small amount of vaseline on the fiber bumper of the contact arm, applying with a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4

SPARK PLUG GAPS.—Spark plug gaps are .027 inch.

STARTER.—Type C8-M1304. Starter is connected to the engine through a Bijur automatic pinion shift. Starter cranks the engine at 100 R.P.M., taking 225-250 amperes. Lock torque is 18.5 pound-feet, current being 575 amperes at 4.1 volts. Running freely, starter takes 35 amperes, armature revolving at 3400 R.P.M. Pressure of brushes on commutator is 36-38 ounces.

OILING.—Put 5 or 6 drops of light engine oil in the starter oilers every month.

GENERATOR.—Type K643-M792. Generator voltage regulation is by vibrating regulator. Maximum charging rate is 20 amperes, reached at 1200-2000 R.P.M. of the armature or 15-25 miles per hour. Charging rate decreases as battery becomes charged. Shunt field winding takes 1.2 to 1.4 amperes at 7.75 volts.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY-REGULATOR.—Type K643-R105C. Relay and regulator are contained in an aluminum case, mounted on top of the generator frame. Relay closes at 8-10 miles per hour or 500 R.P.M. of the armature, and opens at 7-8 miles per hour or 400-450 R.P.M. of the armature. Relay contacts separate .015 inch. Air gap between armature (moving member) and coil core is .030 inch. Relay contacts should close when the voltage of the generator reaches 6.5 volts. To adjust the relay, remove the disconnecting plug and insert the adjusting wrench in the hole nearest the plug end and make a trial adjustment of the spring tension. Turn the wrench to the right to raise the cut-in voltage and to the left to decrease the cut-in voltage. Replace the plug and ascertain the result of the adjustment. Continue making trial adjustments in this manner until the desired relay action is obtained. Be sure that the disconnecting plug is always removed before inserting the wrench in the adjusting hole, or a direct short circuit of the battery is liable to occur. Adjust the regulator in the same manner, making trial adjustments with the plug removed until the specified action is obtained. To adjust the regulator, the generator must be driven at 1000-1400 R.P.M., charging a battery of 1.250 solution, or higher. The regulator must be adjusted to limit the voltage of the generator to 7.85 volts. Turn the adjusting nut to the right to raise the voltage and to the left to lower the voltage.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dimmer lamps are 6-8 volt, 7 cp. Dash and tail lamps are 6-8 volt, 2 cp.

FUSES.—Fuses are 15 ampere.

Plate No. 502

GRANT

MODEL H (1920) SERIAL NOS. 2030 UP.

SERIES (1921)

BIJUR GENERATING, STARTING AND LIGHTING SYSTEM

ATWATER-KENT IGNITION

BATTERY.—Prest-O-Lite, Type 613-RHN, 6 volt, 115 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Type CC. Breaker contacts separate .006 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING.—Remove the distributor cap every two weeks, and put 4 or 5 drops of light engine oil in the oil hole exposed. Put a small amount of vaseline on the cam, applying with a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when piston entering power stroke is on top dead center, spark control and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .025 inch.

STARTER.—Type FD-140, M-1308 or M-1381. Starter is connected to the engine through a Bendix drive. Lock torque is 11.6 pound-feet, current being 550 amperes at 4 volts. Pressure of brushes on the commutator is 30 ounces.

OILING.—Put 5 or 6 drops of light engine oil in each of the starter bearing oilers every month.

GENERATOR.—Type P-230, M-1345. Generator current regulation is by third brush system. Maximum current output is 14 amperes, reached at 1500 R.P.M. of the armature or 15-20 miles per hour. Charging rate reduces to 12 amperes at 30-40 miles per hour. Charging rate is varied by inserting a special toothed wrench in the adjusting hole in the commutator end plate and moving the third brush assembly through a ratchet engagement. Turn the adjusting wrench in a clockwise direction to increase the charging rate, and in the opposite direction to decrease the charging rate.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 8-10 miles per hour or 600 R.P.M. of the armature, and opens at 6-8 miles per hour or 550 R.P.M. of the armature. Relay contacts separate .011 inch. Air gap between relay armature and coil core is .025 inch, contacts closed. Adjust spring tension on relay so that contacts close when the voltage of the generator, measured across the main brushes, reaches 6.5 volts. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 15 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp.

KANKAKEE

9-N ENGINE (1920)

DELCO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

BATTERY.—6 volt. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 2159. Distributor Model No. 5215. Breaker contacts separate .020 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard emery stone.

Oiling.—Put 4 or 5 drops of light engine oil in each of the distributor head oilers every two weeks. If the track of the rotor button is not well polished, apply a small amount of vaseline with a soft cloth. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

Timing.—Breaker contacts begin to separate when the top dead center mark on the fly-wheel is $1\frac{3}{8}$ inches past the indicator, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—Spark plug gaps are .030 inch.

STARTER.—Model No. 179. Starter is connected to the engine through a Bendix drive.

Oiling.—Put 5 or 6 drops of light engine oil in each of the starter oilers every month. Remove the grease plug in the reduction gear housing and inject soft cup grease every six months.

GENERATOR.—Model No. 180. Generator current regulation is by the third brush system. Maximum current output of 11-15 amperes is reached at 1200 R.P.M. of the armature or 18-24 miles per hour.

Amperes	Generator Data	R.P.M.
4		800
8		1000
11-15		1200
11-14		2000
8-12		2300

Charging rate is varied by adjusting third brush setting. Loosen the three screws holding the third brush plate and move the third brush in a counter-clockwise direction (looking at the commutator end) to increase the charging rate. Move the brush in the opposite direction to decrease the charging rate. Tighten the screws and reseal the brush after adjusting position.

Oiling.—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted on generator frame. Relay closes at 8-9 and opens at 5-7 miles per hour. Relay contacts separate .046 to .062 inch. Air gap between relay armature (moving member) and coil core is .020 to .035 inch, contacts closed. To adjust relay, connect a voltmeter between the positive generator brush and ground. Then slowly speed up the generator and adjust the relay spring tension by turning the thumb screw until the relay contacts close when the voltmeter indicates 7.5 volts. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 18 cp. Dimmer lamps are 6-8 volt, 5 cp. Dash, tail, tonneau and step lamps are 6-8 volt, 2 cp. Dome lamp is 6-8 volt, 5 cp. Dash, dome and step lamps have double contact base. All other lamps have single contact base.

CIRCUIT BREAKER.—A vibrating circuit breaker takes the place of fuses. It requires 25 amperes to start the vibrator, but 3-5 amperes will cause it to continue.

Plate No. 504

CHEVROLET

MODEL F. B. (1921)

AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM

REMY IGNITION

BATTERY.—Willard, Type SJR-4, 6 volt, 115 ampere-hours. The negative (—) terminal is grounded.

IGNITION.—Breaker contacts separate .020 to .025 inch. When condition of contacts affects the ignition, resurface with a very fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Refill the cup under the distributor head with soft cup grease and turn down two turns every two weeks. Put a small amount of vaseline on the fiber bumper of the contact arm, using a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Contacts should begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 2, 4, 3.

SPARK PLUG GAPS.—Spark plug gaps are .025 to .030 inch.

STARTER.—Model ME. Starter is connected to engine through a Bendix drive.

Starter Data		
Torque	R.P.M.	Amperes
1 lb. ft.	1960	80
3 lb. ft.	1100	160
5 lb. ft.	800	220
7 lb. ft.	500	280
9 lb. ft.	230	340
13 lb. ft.	Lock	470

OILING.—Starter bearings are packed with grease. Thoroughly clean out and repack starter bearings with soft cup or ball bearing grease every six months.

GENERATOR.—Model GH. Generator current regulation is by third brush system.

Amperes	Generator Data	R.P.M.
5.00		760-820
10.00		1020-1100
12.50		1200-1300
15.00		1460-1675
15-16		1950-2250

When generator is operating freely as a motor, current is 2.7 amperes, armature revolving at 450 R.P.M. Shunt field current is 1-7 amperes.

OILING.—Put 5 or 6 drops of light engine oil in each of generator bearing oilers every two weeks. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.

RELAY.—Relay closes at 8-10 miles per hour or 550-600 R.P.M. of armature and opens at 5-8 miles per hour or 450-500 R. P. M. of armature. Charging current is .5 to 1.5 amperes at closing and the discharge current 0-1 ampere at opening of relay. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dash and tail lamps are 6-8 volt, 4 cp.

FUSES.—Fuse is 20 ampere.

Plate No. 505

GARDNER

MODEL 1920-21

WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM WESTINGHOUSE IGNITION

BATTERY.—Willard, Type SJWN-3, 6 volt, 80 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Type SC. Style 290,356. Breaker contacts separate .012 to .016 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oilstone. The bumper on the contact spring is $\frac{1}{8}$ inch off center from the line through the centers of the shaft and terminal screw, this offset being opposite to the direction of rotation of the cam. The above adjustment is made by bending the solid arm at the terminal block. A pull of 20 to 25 ounces, applied to the movable contact, is required to separate the contacts .020 inch. The spring pressure is adjusted by bending the solid arm at the point of contact with the contact spring. Resistance of the primary winding of the ignition coil is 1 ohm. The resistance of the ballast resistor is .4 ohm. Resistance of the secondary winding is 3700-4700 ohms.

OILING.—Put 4 or 5 drops of light engine oil in the oiler at the side of the breaker box every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 3, 4, 2.

SPARK PLUG GAPS.—Spark plug gaps are .025 inch.

STARTER.—Frame 100. Style 265,774B. Rotation is counter-clockwise, looking at commutator end. Starter is connected to the engine through a Bendix drive. Lock torque is 12 pound-feet, current being 475 amperes at 4 volts. Torque at 1600 R.P.M. is 1.75 pound-feet. Running freely, starter takes 75 amperes, armature revolving at 4000 R.P.M.

OILING.—Put 5 or 6 drops of light engine oil in the starter oilers every month.

GENERATOR.—Frame No. 760. Style 271,528-B. Rotation is counter-clockwise looking at the commutator end. Generator current regulation is by the third brush system. Maximum current output is 15-17 amperes at 7.5 volts, reached at 1100-1500 R.P.M. of the armature, or 15-20 miles per hour.

Generator Data		
Amperes	R.P.M.	Volts
0	500	6.5
8.0	750	7.0
15-17	1100-1500	7.5

Shunt field winding takes 2.5 amperes at 6 to 6.3 volts. Move the third brush in a counter-clockwise direction to increase the charging rate, and in a clockwise direction to decrease the charging rate.

OILING.—Put 5 or 6 drops of light engine oil in the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted in the generator frame. Relay closes at 7 miles per hour or 575-600 R.P.M. of the armature, and opens at 5 miles per hour or 525-575 R.P.M. of the armature. Adjust the spring tension on the relay armature so that the contacts open with a discharge current of 0-3 amperes. Adjust the air gap between the relay armature and coil core so that the contacts close when the voltage of the generator reaches 6.2 to 6.5 volts. Air gap between relay armature and coil core is .005 inch, contacts closed. Contacts separate .030 to .035 inch. Resistance of the shunt coil is 68 ohms. Clean relay contacts by drawing unglazed paper between them.

LAMPS.—Head lamps are 6-8 volt, 18 cp. Dash, dimmer and tail lamps are 6-8 volt, 2 cp.

FUSES.—Generator fuse is 5 ampere. Lighting circuit fuses are 20 ampere.

Plate No. 506

ROAMER

MODEL 6-54-E (1921)

BIJUR GENERATING, STARTING AND LIGHTING SYSTEM

BOSCH IGNITION

BATTERY.—Columbia, 6 volt, 90 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Breaker contacts separate .014 to .016 inch. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Put 2 or 3 drops of light machine oil in each of the magneto oilers every month. Put a small amount of vaseline on the fiber bumper of the contact arm, applying with a toothpick. If the car is driven more than 1000 miles in a month, these attentions must be given every 1000 miles.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .025 inch.

STARTER.—E.D.-160, M-979. Rotation is counter-clockwise, looking at commutator end. Starter is connected to the engine through a Bendix drive. Lock torque is 16.5 pound-feet, current being 665 amperes at 3.6 volts. Running freely, armature revolves at 6800 R.P.M., taking 30 amperes. Pressure of brushes on commutator is 25 ounces.

OILING.—Put several drops of light engine oil in each of the starter bearings every month.

GENERATOR.—Type L-61, M-1204. Rotation is counter-clockwise, looking at commutator end. Generator current regulation is by third brush system. Maximum current output is 15 amperes, reached at 20 miles per hour or 1400 R.P.M. of the armature. Charging rate is varied by inserting a special toothed wrench in the adjusting hole in the commutator end plate and shifting the third brush assembly through a ratchet engagement. Turn the adjusting wrench to the right (facing commutator end) to increase the charging rate. Maximum current output must not exceed 15 amperes at 1400-1600 R.P.M. Pressure of brushes on commutator is 14 ounces. There is a 10 ampere fuse mounted on the generator frame to protect the field winding should excessively high resistance occur in the charging circuit.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 8-9 miles per hour or 550-600 R.P.M. of the armature and opens at 7-8 miles per hour or 500-550 R.P.M. of the armature. Relay contacts separate .045 inch. Air gap between relay armature (moving member) and coil core is .035 inch, contacts closed. To adjust relay, connect a voltmeter across the main brushes of the generator. Then insert a special wrench in the small adjusting hole in the commutator end plate and adjust relay spring tension until the contacts close when the voltage reaches 6.5 volts. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6 volt, 15 cp. Dimmer and dome lamps are 6 volt, 4 cp. Dash, tail and tonneau lamps are 6 volt, 2 cp.

CUSTOM BUILT SIX (1919-20-21) REMY GENERATING, STARTING AND LIGHTING SYSTEM

REMY IGNITION

BATTERY:—(1919) 6 volt, 80 ampere hour (1920-21) Willard Type SJRN-4, 6 volt, 117.5 ampere hour. The positive (+) terminal is grounded.

IGNITION.—Breaker contacts separate .020 to .025 inch. When the condition of the contacts affects the ignition, resurface them with a fine, flat jeweler's file or worn No. 00 sandpaper.

Oiling.—Refill the grease cup under the breaker head with soft cup grease and turn down two turns every two weeks. Put a small amount of vaseline on the fiber bumper of the contact arm, applying with a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

Timing.—Breaker contacts begin to separate when the top dead center mark on the fly-wheel is $\frac{3}{4}$ inch past the indicator, spark control lever and breaker assembly in the fully retarded position in the 1920 and 1921 cars and when the marking is at the indicator on the 1919 cars.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—The spark plug gaps are .025 inch.

STARTER.—Model No. 303-C. Rotation is counter-clockwise, looking at the commutator end. Starter is connected to the engine through a Bendix drive.

Starter Data

Torque	R.P.M.	Amperes	Volts
1 lb. ft.	1850	110-115	5.3-5.5
2 lb. ft.	1400	158-165	5.1-5.3
3 lb. ft.	1150	200-210	4.9-5.1
4 lb. ft.	850	238-250	4.6-4.8
5 lb. ft.	700	275-285	4.4-4.6
15 lb. ft.	Lock	550-575	3.3-3.4

Pressure of brushes on the commutator is 20-24 ounces.

Oiling.—Put 4 or 5 drops of light engine oil in each of the starter bearing oilers every month.

GENERATOR:—Model Nos. 230-B & E. Rotation is counter-clockwise looking at the commutator end. Generator current output is 22 amperes, reached at 1800 R.P.M. of the armature or 25 miles per hour. A thermostat, located in the brush rigging of the generator, cuts a resistance into the field circuit when the temperature reaches 175° F., reducing the maximum charging rate 6 amperes.

Generator Data

Amperes	R.P.M.	Volts
0	515	6.4
7	745	7.1
14	1000	7.9
22	1800	8.6
17	2500	8.2
12.25	3000	7.8

Charging rate is varied by adjustment of the third brush setting. The third brush assembly is moved by turning a screw exposed in the commutator end plate. Turn the screw to the right to increase the charging rate and to the left to decrease the charging rate. Reseat the brush after adjusting position. The pressure of the main brushes on the commutator is 17-20 ounces. The pressure of the third brush is 13-17 ounces.

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Model No. 264-A. Relay closes at 525 R.P.M. of the armature or 8 miles per hour and opens at 475 R.P.M. of the armature or 6 miles per hour. Contacts separate .012 to .015 inch. Air gap between relay contacts and coil core is .012 to .015 inch, contacts closed. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 18 cp. Dash and tail lamps are 6-8 volt, 2 cp.

On the 1919 cars head lamps are 6-8 volt, 15 cp. Dimmer lamps are 6-8 volt, 5 cp.

Plate No. 507

MERCER

SERIES 5 (1920-21) SERIAL NOS. 4600 UP. WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM EISEMANN MAGNETO IGNITION

BATTERY.—Willard, Type SJRN-6, 6 volt, 90 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—(1920) Berling Type F-41 (1921) Eisemann Type G-4, 2nd Ed. Breaker contacts separate .016 to .020 inch on the Berling, and .010 to .012 inch on the Eisemann magneto. Resurface contacts with a fine flat jewelers file or worn No. 00 sandpaper.

OILING.—Berling:—Put 10 drops of light engine oil in each oiler, and put a small amount of vaseline on the surface of the cam every 1000 miles. Eisemann:—Put 1 or 2 drops of light oil in each oil well every 1000 miles.

Timing.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plug Gaps.—Spark plug gaps are .022 inch.

STARTER.—Frame No. 776 and 778. Starter is connected to the engine through a Bendix drive. Starting switch is magnetic type controlled by a push button on the dash. Starter cranks the engine 115 R.P.M., taking 250 amperes.

Starter Data		
Torque	R.P.M.	Amperes
0 lb. ft.	3500-6000	35-50
5 lb. ft.	1400	235
31 lb. ft.	Lock	750

Brush tension should be from 2½ to 3 pounds per brush.

Oiling.—Put 5 or 6 drops of light engine oil in the starter oilers every month.

GENERATOR.—Frame No. 760. Style 287,842. Generator current regulation is by the third brush system. Maximum current output is 15-17 amperes, reached at 1250 R.P.M. of the armature or 16-20 miles per hour.

Generator Data					
Amperes	Cold Test	R.P.M.	Amperes	Hot Test	R.P.M.
0		450	0		500
8		675	6		725
12		840	9		850
15-17		1250	12-14		1250
10		2000	7-8		2000

The cold test readings are obtained with a generator temperature under 95° F. The hot test readings are obtained after the generator has been operated one hour at 1800 R.P.M., charging a half-charged battery. Shunt field current is 2.8 to 3.25 amperes, when 6 volts pressure is applied to its terminals. When generator is operating freely as a motor, current is 3.5 to 5 amperes at 6.6 volts.

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted in the generator frame. Relay closes at 500-550 R.P.M. of the armature or 7-9 miles per hour, and opens at 450-500 R.P.M. of the armature or 5-7 miles per hour. Adjust the spring tension on the relay armature so that the contacts open with a discharge current of 0-3 amperes. Adjust the air gap between the relay armature and coil core so that the contacts close when the voltage of the generator reaches 6.2 to 6.5 volts. Air gap between relay armature and coil core is .005 inch, contacts closed. Contacts separate .030 to .035 inch. Resistance of the shunt coil is 68 ohms. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dimmer lamps are 6-8 volt, 5 cp. Tail lamp is 6-8 volt, 5 cp. Dash lamp is 6-8 volt, 2 cp.

FUSES.—Lighting fuses are 30 ampere. Generator field fuse is 5 ampere.

Plate No. 508

WILLYS-KNIGHT

MODEL 20 (1920)

MODEL 20 (1921)

AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM CONNECTICUT IGNITION

BATTERY:—U. S. L. (1920) 6 volt, 120 ampere hour. (1921) Type 317 6 volt, 170 ampere hour. The negative (—) terminal is grounded.

IGNITION.—Breaker contacts separate .018 inch. They are made of tungsten. When the condition of the contacts affects the ignition, renew the inner breaker mechanism. For temporary service, resurface contacts with fine emery cloth.

OILING.—Refill the cup under the breaker head with pure vaseline and turn down every month. If the car is driven more than 1000 miles in a month, this must be done every 1000 miles. Do not put grease or oil in the cup.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 3, 4, 2.

SPARK PLUG GAPS.—Spark plug gaps are .025 inch.

STARTER.—Model MH-1014. Starter is connected to the engine through a Bendix drive.

Starter Data		
Torque	R.P.M.	Amperes
2 lb. ft.	1160	110
6 lb. ft.	700	225
8 lb. ft.	580	275
10 lb. ft.	460	325
12 lb. ft.	375	365
17.5 lb. ft.	Lock	600

OILING.—Put 5 or 6 drops of light engine oil in each of the starter oilers every two weeks.

GENERATOR.—Model GJ. Generator current regulation is by third brush system. Maximum current output is 12-16 amperes, reached at 1700 R.P.M. of the armature or 25 miles per hour.

Generator Data					
Amperes	Cold Test	R.P.M.	Amperes	Hot Test	R.P.M.
0		500	0		580
4		600	3		700
12		960	9		1050
16		1400	12		1360
16.5		1700	12.7		1700
12		3400	10		3400

Move the third brush in a clockwise direction (looking at the commutator end) to increase the charging rate, and in the opposite direction to decrease the charging rate. Reseat the brush after adjusting position.

OILING.—Put 5 or 6 drops of light engine oil in the generator bearing oilers every week. If the car is driven more than 250 miles in a week, the oiling must be done every 250 miles.

RELAY.—Relay closes at 8-10 miles per hour or 580 R.P.M. of the armature, and opens at 6-8 miles per hour or 360 R.P.M. of the armature. Relay contacts separate .030 to .045 inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 30 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are in series and are each 3-4 volt, 2 cp.

FUSES.—Fuses are 20 ampere.

Plate No. 509

Plate No. 510

PIEDMONT

MODEL 6-40 (1921)

REMY GENERATING, STARTING, AND LIGHTING SYSTEM

REMY IGNITION

BATTERY.—Willard, SJRM, 6 volt, 90 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 284-C, Distributor Model No 353-A. Breaker contacts separate .020 to .025 inch. When the condition of the contact points affects the ignition resurface with a flat jewelers file or worn No. 00 sand paper.

Timing.—Breaker contacts begin to separate when piston entering power stroke is on top dead center, spark control and breaker assembly in the fully retarded position.

Firing Order.—Firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—Spark plug gaps are .030 inch.

Oiling.—Refill the cup under the distributor head with soft cup grease and turn down two turns every two weeks. At the same time put a small amount of vaseline on the fiber bumper of the contact arm, using a toothpick. If the car is driven more than 500 miles in two weeks, these attentions should be given every 500 miles.

STARTER.—Starter is connected to engine through a Bendix drive.

Starter Data, Model 303-A

Torque	R.P.M.	Amperes	Volts
1 lb. ft.	1850	110-115	5.3-5.5
2 lb. ft.	1400	158-165	5.1-5.3
3 lb. ft.	1150	200-210	4.9-5.1
4 lb. ft.	850	238-250	4.6-4.8
5 lb. ft.	700	275-285	4.4-4.6
15 lb. ft.	Lock	550-575	3.3-3.4

Oiling.—Put several drops of light engine oil in each of starter bearings every month.

GENERATOR.—Generator current regulation is by the third brush system. A thermostat located in the brush rigging of the generator, cuts in a resistance at a temperature of 175° F., reducing the maximum charging rate 6 amperes. Resistance also acts as a shunt field fuse. The thermostat is intended to change the charging rate as demand of seasons or car operation requires. Never touch the thermostat points.

Generator Data, Model 230-B

Ampere	R.P.M.	Volts
0	515	6.4
7	745	7.1
14	1000	7.9
22	1800	8.6
17	2500	8.2
12.25	3000	7.8

Above tests made with relay in circuit and thermostat contacts closed, and without ignition. Field winding takes 5 amperes at 6.4 volts. Pressure of main brushes on commutator should be 17 to 20 ounces. Pressure of third brush should be 13 to 17 ounces.

Oiling.—Fill generator bearing oil wells with light engine oil every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Model 264-A. Relay closes at 7-10 miles per hour, and opens at 5-8 miles per hour. Air gap between relay contacts is .012 to .015 inch. Air gap between armature (moving member) and coil core is .012 inch to .015 inch, with contacts closed. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sand paper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volts, 15 cp. Dash and tail lamps are 6-8 volts, 2 cp.

Plate No. 511

LEXINGTON

SERIES S (1920-21)

GRAY & DAVIS GENERATING, STARTING AND LIGHTING SYSTEM CONNECTICUT IGNITION

BATTERY.—Willard, Type SJW-4, 6 volt 100 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Breaker contacts separate .017 to .024 inch. They are made of tungsten. When the condition of the contacts affects the ignition, renew the inner breaker mechanism. For temporary service, resurface contacts with fine emery cloth.

OILING.—Refill the cup under the breaker head with pure vaseline and turn down every month. If the car is driven more than 1000 miles in a month, this must be done every 1000 miles. Do not put grease or oil in the cup.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .025 inch.

STARTER.—Model No. 510. Starter is connected to the engine through a Bendix drive. Starter cranks the engine at 100-150 R.P.M., taking 140-180 amperes. Lock torque is 10 pound-feet, current being 400 amperes. Running freely, starter takes 45 amperes, armature revolving at 4500 R.P.M.

OILING.—Put 5 or 6 drops of light engine oil in each of the starter bearing oilers every month.

GENERATOR.—Model No. 605. Generator current regulation is by the third brush system. Maximum charging rate is 15 amperes, reached at 1500 R.P.M. of the armature or 23 miles per hour. Charging rate reduces to 10 amperes at 2500-3000 R.P.M. of the armature or 38-45 miles per hour. Shunt field winding takes 2.6 amperes at 6 volts. Charging rate is varied by adjusting the third brush setting. Adjustment is made by turning the pinion screw located at the bottom of the rear cover plate, between the fuse and relay. Turn this screw to the right to increase the charging rate and to the left to decrease the charging rate. Reseat the brush after adjustment is made.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 8-10 miles per hour or 550-600 R.P.M. of the armature and opens at 6-8 miles per hour or 500-550 R.P.M. of the armature. Relay contacts separate .015 to .018 inch. Air gap between relay armature and coil core is .010 to .012 inch, contacts closed. Charging current is 1 to 3 amperes at closing and the discharge current 0-2 amperes at the opening of relay contacts. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dash lamps are 6-8 volt, 4 cp. Tail lamp is 6-8 volt, 2 cp.

FUSES.—Head light fuses are 15 ampere. Tail light fuse 5 ampere. Generator field fuse 5 ampere.

Plate No. 512

NASH MODEL 1921

WAGNER GENERATING, STARTING AND LIGHTING SYSTEM WAGNER IGNITION

BATTERY.—Willard, Type SJRN-4, 6 volt, 117 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Coil Model K-32. Distributor Model KC-335. Breaker contacts separate .024 to .029 inch. When the condition of the contacts affects the ignition, renew the lever arm and contact screw.

OILING.—Screw up the grease cup under the breaker head one-half turn every two weeks. If the car is driven more than 500 miles in two weeks, this must be done every 500 miles. Put 3 or 4 drops of light engine oil on the wick in the breaker lever spindle every 6 months.

TIMING.—Breaker contacts begin to separate when piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .025 to .028 inch.

STARTER.—Model E.M.-279, Type 46-T. Starter is connected to the engine through a Bendix drive. Starter cranks the engine at 125 R.P.M., current being 200 amperes. Operating freely, starter current is 60-90 amperes, armature revolving at 6800 R.P.M. Lock torque is 13.8 pound-feet, current being 600 amperes.

OILING.—Put 5 or 6 drops of light engine oil in each of starter oilers every month. Remove the plug in the reduction gear housing and inject Gredag grease every six months.

GENERATOR.—Model No. E.M.-337. Generator current regulation is by the third brush system. Maximum charging rate is 12 amperes, reached at 18-23 miles per hour.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Model I-471. Relay closes at 8-10 miles per hour or 640-800 R.P.M. of the armature, and opens at 6-8 miles per hour or 480-640 R.P.M. of the armature. Charging current at closing is 2 amperes, and the discharge current is 0-4 amperes at opening of relay contacts. Relay contacts separate .035 to .065 inch. Air gap between relay armature (moving member) and coil core is .025 inch, contacts closed. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 20 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp.

FUSES.—Fuses are 20 ampere.

MOON MODEL 6-68 (1921) DELCO GENERATING, STARTING, AND LIGHTING SYSTEM DELCO IGNITION

BATTERY.—Exide, Type 3-XC-15-1, 6 volt 100 ampere hours. The negative (—) terminal is grounded.

IGNITION:—Coil Model No. 2159, Distributor Model No. 5215. Breaker contacts separate .020 inch. They are made of tungsten. When the condition of the contacts affects the ignition remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING.—Put 4 or 5 drops of light engine oil in each of the ignition unit oilers every two weeks. If the track of the rotor button in the distributor head is not well polished, apply a small amount of vaseline with a soft cloth. If car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when the top dead center mark on the flywheel is $2\frac{1}{4}$ inches past the indicator, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .025 to .030 inch.

STARTER.—Model No. 179. Starter is connected to the engine through a Bendix drive. Starter cranks the engine at 125 R.P.M., taking 180 amperes. Lock torque is 7 pound-feet.

OILING.—Put 4 or 5 drops of light engine oil in the starter oilers every month.

GENERATOR.—Model No. 180. Rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. Maximum charging rate is 11-15 amperes, reached at 1200 R.P.M. of the armature or 16-20 miles per hour.

Amperes	Generator Data	R.P.M.
Neutral		550
4		800
8		1000
11-15		1200
11-14		2000

Charging rate is varied by the adjustment of the third brush setting. To move the third brush, loosen the three screws holding the bearing retainer plate on the commutator end and shift the plate. Move in a counter-clockwise direction to increase the charging rate, or in the opposite direction to decrease the charging rate. Tighten the adjusting screws and reseal the brush after making the adjustment. Maximum charging rate must not exceed 16 amperes.

OILING.—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted on the generator frame. Relay closes at 550-600 R.P.M. of the armature or 7-8 miles per hour, and opens at 500-550 R.P.M. of the armature or 5-6 miles per hour. Relay contacts separate .046 to .062 inch. Air gap between the relay armature and coil core is .020 to .035 inch, contacts closed. To adjust relay connect a voltmeter between the positive (+) generator brush and ground. Then slowly speed up the generator and adjust the relay spring tension by turning the thumb nut until the contacts close when the voltmeter indicates 7.5 volts. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 18 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 3 cp.

CIRCUIT BREAKER.—A vibrating circuit takes the place of fuses. It requires 25 amperes to start the vibrator. While vibrating, the current is 3-5 amperes.

NORTH-EAST GENERATING, STARTING AND LIGHTING SYSTEM

NORTH-EAST IGNITION

Note:—This page applies to cars made in late 1921 with the exception of the generator. For generator data see page 752.

BATTERY.—Willard, Type SJR-4, 6 volt, 111 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Model T, Type 10442 Distributor. Type 10444 Coil. Breaker contacts separate .020 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING.—Put several drops of light engine oil in the oiler under the breaker head every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

TIMING.—Breaker contacts begin to separate when the flywheel marking "Spark 1 and 6" is in alignment with the upper edge of the right-hand engine support, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 4, 2, 6, 3, 5.

SPARK PLUG GAPS.—Spark plug gaps are .030 inch.

STARTER.—Model R, Type 3581. Starter is connected to the engine through a chain and ratchet engagement on the universal shaft. Starter cranks the engine at 100 R. P. M.

OILING.—Put 4 or 5 drops of light engine oil in each of the starter oilers every month. Starter gear housing is packed with soft cup grease, which should be renewed every 2 years.

GENERATOR.—Model L, Type 3711. Generator current regulation is by third brush system. Maximum current output is 16 amperes, reached at 1300 R.P.M. of the armature or 25-28 miles per hour.

Amperes	Generator Data	R.P.M.
0		500
7		700
12		900
14		1000
16		1300
12		2000

Charging rate is varied by adjustment of the third brush setting. It is first necessary to loosen the two clamp screws located on either side of the bearing cap on the commutator end of generator. Then turn the adjusting stud (directly below the bearing cap) in a counter-clockwise direction (looking at commutator end) to increase the output, or in a clockwise direction to decrease the output. Maximum current output must never be increased above 16 amperes. Lock the third brush assembly by tightening the two clamp screws after the desired adjustment has been made.

OILING.—Put 3 or 4 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Type 8212. Relay closes at 10-12 miles per hour or 500-550 R.P.M. of the armature, and opens at 8-10 miles per hour or 450-500 R.P.M. of the armature. Relay is adjusted to close when the voltage of the generator reaches 7 volts, and open with a discharge current of 1 ampere. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 15 cp. Dash and tail lamps are 6-8 volt, 2 cp.

FUSES.—Generator fuse is 6 ampere. Lighting circuit fuses are 5 ampere.

Plate No. 515

JONES

MODELS 28 B E & G (1920-21)

AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM

CONNECTICUT IGNITION

BATTERY.—Prest-O-Lite, Type 613-RHN, 6 volt, 120 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Breaker contacts separate .020 inch. When the condition of the contacts affects the ignition, renew the inner breaker mechanism. For temporary service, resurface contacts with fine emery cloth.

OILING.—Refill the cup under the breaker head with pure vaseline and turn down every month. If the car is driven more than 1000 miles in a month, this must be done every 1000 miles. Do not put grease or oil in the cup.

TIMING.—Breaker contacts begin to separate when piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .030 inch.

STARTER.—Model MH. Starter is connected to the engine through a Bendix drive.

Starter Data

Torque	R.P.M.	Amperes
0 lb. ft.	3000-4000	70
2 lb. ft.	1160	110
6 lb. ft.	700	225
10 lb. ft.	460	325
12 lb. ft.	375	365
17.5 lb. ft.	Lock	600

OILING.—Put 4 or 5 drops of light engine oil in each of the starter oilers every month.

GENERATOR.—Model GJ. Generator current regulation is by third brush system. Maximum charging rate is 16 amperes, reached at 1700 R.P.M. of the armature or 25 miles per hour.

Generator Data.

Amperes	Cold Test	R.P.M.	Amperes	Hot Test	R.P.M.
0		500	0		580
4		600	3		700
8		750	6		840
12		960	9		1050
16		1400	12		1360
16.5		1700	12.7		1700

Charging rate is varied by adjustment of the third brush setting. Move the third brush in the direction of armature to increase the charging rate and in the opposite direction to decrease the charging rate.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes a 550-600 R.P.M. of the armature or 8-10 miles per hour and opens at 500-550 R.P.M. of the armature or 6-8 miles per hour. Relay contacts separate .030 inch. Air gap between relay armature and coil core is .045 to .050 inch. Adjust relay to close at 7.5 generated volts, and open with a discharge of 1/2 ampere. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dimmer lamps are 6-8 volt, 5 cp. Dash and tail lamps are 6-8 volt, 2 cp.

CHALMERS
MODEL 35-C
AUTOLITE STARTER & GENERATOR
REMY IGNITION

Plate No. 516

CHALMERS MODEL 35-C (1920-21) AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM REMY IGNITION

BATTERY.—Prest-O-Lite, Type 613-RHN, 6 volt, 80 ampere-hour. The positive (+)

IGNITION.—Breaker contacts separate .015 to .018 inch. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or well worn No. 00 sandpaper.

OILING.—Refill the grease cup under the distributor head with soft cup grease and turn down two turns every two weeks. Put a small amount of vaseline on the fiber bumper of the contact arm, applying with a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when the top dead center mark on the fly-wheel is $1\frac{5}{16}$ inches past the indicator on the 1920 cars and $1\frac{21}{32}$ inches past the indicator on the 1921 cars, with the spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 4, 2, 6, 3, 5.

SPARK PLUG GAPS.—Spark plug gaps are .030 inch.

STARTER.—Model MH-1003. Starter is connected to the engine through a Bendix drive. Lock torque is 17.5 pound-feet, current being 600 amperes at 5 volts. Starter cranks the engine at 150 R.P.M., taking 275 amperes.

OILING.—Put 4 or 5 drops of light engine oil in each of the starter oilers every month.

GENERATOR.—Models GJ-1057 & 1060. Generator current regulation is by the third brush system. Maximum current output is 12-16 amperes, reached at 1700 R.P.M. or 22 miles per hour.

Cold Test		Generator Data		Hot Test	
Amperes	R.P.M.	Amperes	R.P.M.	Amperes	R.P.M.
0	500	0	580		
8	750	6	840		
12	960	9	1050		
16	1400	12	1360		
16.5	1700	12.7	1700		
12	3400	10	3400		

Above readings are obtained with a battery solution of 1.300.

OILING.—Put 4 or 5 drops of light engine oil in the rear generator bearing oiler every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 7-9 miles per hour or 460-510 R.P.M. of the armature and opens at 5-7 miles per hour or 410-460 R.P.M. of the armature. Charging current is .5 to 1.5 amperes at closing and the discharge current 0-1 ampere at the opening of relay contacts. Contacts separate .030 to .045 inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 15 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and lamps are 6-8 volt, 2 cp.

CLIMBER

MODEL T (1919-20). SERIAL NOS. 0 UP

MODEL T & K (1921-22). SERIAL NO. 700 TO 2000

WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM ATWATER KENT IGNITION

Plate No. 517

BATTERY.—Battery is 6 volt, 120 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Type CC. Breaker contacts separate .006 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING.—Remove the distributor cap and put 4 or 5 drops of light engine oil in the exposed oil hole every two weeks. Put a small amount of vaseline on the cam, applying with a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is a top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 3, 4, 2.

SPARK PLUGS.—Diameter $\frac{7}{8}$ inch. Spark plugs are .030 inch.

STARTER.—Frame No. 100. Starter is connected to the engine through a Bendix drive. Starter cranks the engine at 130 R.P.M., taking 250-300 amperes.

Starter Data			
Torque	R.P.M.	Amperes	Volts
0 lb. ft.	4100-7000	35-45	5.5
1.75 lb. ft.	1600	145	5.5
12 lb. ft.	Lock	475	4.0

Pressure of brushes on the commutator is $1\frac{1}{4}$ to $1\frac{1}{2}$ pounds.

OILING.—Put 5 or 6 drops of light engine oil in the starter oilers every month.

GENERATOR.—Frame No. 765. Generator current regulation is by third brush system. Maximum current output is 15-17 amperes at 900-1400 R.P.M. of the armature or 20-25 miles per hour.

Amperes	Generator Data	R.P.M.
0		375
8		550
15-17		900-1400
7-11		2500
Hot Test		1200

Field winding takes 3.25 to 3.75 amperes at 6 to 6.3 volts. Running freely as a motor, generator takes 6 amperes at 6 to 6.3 volts. Charging rate is varied by adjustment of the third brush setting.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 375-425 R.P.M. of the armature or 8-10 miles per hour and opens at 350-375 R.P.M. of the armature or 6-8 miles per hour. Adjust relay spring tension so that contacts open with a discharge current of 0-3 amperes from the battery. Adjust armature stop (which determines the air gap between the relay armature and coil core) so that the contacts close when the voltage of the generator reaches 6.2 to 6.5 volts. Contacts separate .030 to .035 inch. Air gap between relay armature and coil core is .005 inch, contacts closed. Resistance of the shunt winding is 68 ohms. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 20 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 4 cp. Tail lamp has single contact base. All others have double contact base.

Plate No. 518

LORRAINE

MODEL 1920 AND 1921

WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM WESTINGHOUSE IGNITION

BATTERY.—U. S. L., Type HDC-311-C, 6 volt, 94 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Type SC. Breaker contacts separate .012 to .016 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone. The bumper on the contact arm spring is $\frac{1}{8}$ inch off center from the line through the centers of the shaft and terminal screw, the offset being opposite to the direction of rotation of the cam. The above adjustment is made by bending the solid arm at the terminal block. A pull of 20-25 ounces, applied to the movable contact, is required to separate the contacts .020 inch. The spring pressure is adjusted by bending the solid arm at the point of contact with the contact spring. Resistance of the primary winding of the induction coil is 1 ohm. Resistance of the ballast resistor is .4 ohm. The resistance of the secondary winding is 3700-4700 ohms.

OILING.—Put 4 or 5 drops of light engine oil in the oiler at the side of the breaker box every two weeks. If the car is driven more than 500 miles in two weeks, the oiling

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 3, 4, 2.

SPARK PLUG GAPS.—Spark plug gaps are .030 inch.

STARTER.—Frame No. 100. Starter is connected to the engine through a Bendix drive. Starter cranks the engine at 150 R.P.M., taking 200 amperes. Lock torque is 12 pound-feet, current being 450 amperes at 4 volts. Running freely, starter takes 50 amperes, armature revolving at 4000 R.P.M.

OILING.—Put 5 or 6 drops of light engine oil in the starter oilers every month.

GENERATOR.—Frame No. 765. Generator current regulation is by the third brush system. Maximum current output is 15-17 amperes, reached at 1400 R.P.M. of the armature or 25 miles per hour.

Generator Data		
Amperes	R.P.M.	Volts
0	375	6.5
7-11	2500	7.5
15-17	900-1400	7.5

Shunt field winding takes 3.25 to 3.75 amperes at 6 to 6.3 volts. Running freely as a motor, generator takes 6 amperes at 6 to 6.3 volts. Move the third brush in the direction of armature rotation to increase the charging rate and in the opposite direction to decrease the charging rate. Reseat brush after adjusting position.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every two weeks.

RELAY.—Relay closes at 375-425 R.P.M. of the armature or 7-9 miles per hour and opens at 325-375 R.P.M. of the armature or 5-7 miles per hour. Adjust the spring tension on the relay armature so that the contacts open with a discharge current of 0-3 amperes. Adjust the air gap between relay armature and coil core so that the contacts close when the voltage of the generator reaches 6.2 to 6.5 volts. Air gap between .035 inch. Resistance of the shunt coil is 68 ohms. Clean relay contacts by drawing relay armature and coil core is .005 inch, contacts closed. Contacts separate .030 to unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 17 cp. Dimmer lamps are 6-8 volt, 2 cp. Dash and tail lamps are 6-8 volt, 2 cp.

Plate No. 519

DANIELS

MODELS D-19 (1920-21-22) SERIAL NOS. 1100 UP.
DELCO GENERATING, STARTING AND LIGHTING SYSTEM
DELCO IGNITION

BATTERY.—Willard Type SJRN-5, 6 volts, 125 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 2127. Distributor Model No. 5212. Breaker contacts separate .018 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel finishing on a hard oilstone.

Oiling.—Put 4 or 5 drops of light engine oil in the upper ball bearing every two weeks. If the track of the rotor in the distributor head is not well polished, apply a small amount of vaseline with a soft cloth. Clean out and repack the distributor housing with soft cup grease every six months. This housing contains the automatic advance and retard mechanism.

Timing.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly one-third advanced.

Firing Order.—The firing order is 1L, 2R, 3L, 1R, 4L, 3R, 2L, 4R.

Spark Plugs.—Diameter $\frac{7}{8}$ inch. Spark gaps are .031 inch.

STARTER.—Model No. 170. Starter is connected to the engine through a set of reduction gears meshed by the operator. The raising and lowering of the two grounded starter brushes serves as a starting switch. Lock torque is 27 lb. ft. at 2.75 volts. The starter running free takes 60 amperes at 6 volts. The direction of rotation is clockwise, looking at the commutator end. The tension of each of the starter brushes should be from $2\frac{1}{4}$ to $2\frac{3}{4}$ pounds.

Oiling.—Put 8 or 10 drops of light engine oil in each of the starter bearing oilers every 1000 miles or each month. Saturate the wick in the oiler at starter gear end of motor once each year. Remove grease plug and repack reduction gear housing with medium heavy cup grease once every six months. Disassemble motor clutch once each year and after cleaning it, repack with vaseline.

GENERATOR.—Model No. 169. Generator current regulation is by the third brush system. The direction of rotation is counter-clockwise, looking at the commutator end. The maximum charging rate is 20-22 amperes, reached at 1450 R.P.M. of the armature or approximately 20 M.P.H. To adjust the charging rate, loosen the three screws in the bearing retainer plate on the end of the generator and shift the third brush. Moving the third brush in the direction of rotation (counter-clockwise) increases the charging rate and in the opposite direction decreases the charging rate. After making the adjustment tighten the three screws.

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted on the generator frame. Relay closes at 8 miles per hour or 500-550 R.P.M. of the armature; and opens at 6 miles per hour or 450-500 R.P.M. of the armature. Relay contacts separate .046 to .062 inch. Air gap between relay armature (moving member) and coil core is .040 inch, contacts closed. To adjust relay, connect a voltmeter between the positive generator brush and ground. Then slowly speed up the generator and adjust the relay spring tension until the relay contacts close when the voltmeter indicates 7.5 volts. Clean the relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp. Dome lamp is 6-8 volt, 2 cp.

CIRCUIT BREAKER.—A vibrating circuit breaker takes the place of fuses. It requires 25 amperes to start the vibrator. While vibrating the current is 10-15 amperes.

Plate No. 520

NORWALK MODEL A-30-K (1921)

DYNETO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

BATTERY.—Battery is 6 volt, 80 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Breaker contacts separate .018 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING.—Put 4 or 5 drops of light engine oil in the distributor shaft bearing oiler every two weeks. If the track of the rotor button in the distributor head is not well polished, apply a small amount of vaseline with a soft cloth. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 3, 4, 2.

SPARK PLUG GAPS.—Spark plug gaps are .025 inch.

STARTER.—Model No. D-204. Starter is connected to the engine through a Bendix drive.

Starter Data

Torque	R.P.M.	Amperes	Volts
0.0 lb. ft.	5600	25	6.4
2.5 lb. ft.	1400	150	5.8
5.0 lb. ft.	850	250	5.3
10.0 lb. ft.	250	420	4.6
14.0 lb. ft.	Lock	530	4.0

OILING.—Put several drops of light engine oil in the starter oilers every month.

GENERATOR.—Model No. C-204. Generator current regulation is by the third brush system. Maximum current output of 14 amperes is reached at 16-18 miles per hour or 1500 R.P.M. of armature.

Generator Data

Amperes	M.P.H.	Volts
0	7-9	6.4
5	9-10	6.6
10	12-14	6.8
12-14	16-18	7.8
8	40-45	6.7

Charging rate may be varied by adjusting the third brush setting. Shunt field current is 3.5 amperes at 6.5 volts.

OILING.—Put 4 or 5 drops of light engine oil in the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 8-10 miles per hour or 450-500 R.P.M. of armature, and opens at 6-8 miles per hour or 400-450 R.P.M. of armature. Relay contacts separate 3/32 inch. Air gap between relay armature and coil core is 1/8 inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 15 cp. Dash and tail lamps are 6-8 volt, 2 cp.

Plate No. 521

WINTHER

MODEL 61 (1920-21) SERIAL NOS. 61-1 UP.

WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM WESTINGHOUSE IGNITION

BATTERY.—Willard, Type SJRN-4, 6 volt, 127 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Type SC. Breaker contacts separate .012 to .016 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone. The bumper on the contact spring is $\frac{1}{8}$ inch off center from the line through the centers of the shaft and terminal screw, this offset being opposite to the direction of rotation of the cam. The above adjustment is made by bending the solid arm at the terminal block. A pull of 20-25 ounces, applied to the movable contact, is required to separate the contacts .020 inch. The spring pressure is adjusted by bending the solid arm at the point of contact with the contact spring. Resistance of the primary winding of the ignition coil is 1 ohm. The resistance of the ballast resistor is .4 ohms. Resistance of the secondary winding is 3700-4700 ohms.

OILING.—Put 4 or 5 drops of light engine oil in the oiler at the side of the breaker box every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 4, 2, 6, 3, 5.

SPARK PLUG GAPS.—Spark plug gaps are .025 inch.

STARTER.—Frame No. 100.—Starter is connected to the engine through a Bendix drive. Starter cranks the engine at 150 R.P.M., taking 200 amperes. Lock torque is 12 pound-feet, current being 475 amperes at 4 volts. Running freely, starter takes 35-45 amperes, armature revolving at 4000 R.P.M. or more.

OILING.—Put 5 or 6 drops of light engine oil in each of the starter oilers every month.

GENERATOR.—Frame No. 760. Generator current regulation is by the third brush system. Maximum current output is 15-17 amperes at 7.5 volts, reached at 1100-1500 R.P.M. of the armature or 15-20 miles per hour.

Generator Data

Amperes	R.P.M.	Volts
0	500	6.5
8.0	750	7.0
15-17	1100-1500	7.5

Shunt field winding takes 2.5 amperes at 6 to 6.3 volts. Move the third brush in the direction of armature rotation to increase the charging rate, and in the opposite direction to decrease the charging rate.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted in the generator frame. Relay closes at 7 miles per hour or 575-600 R.P.M. of the armature, and opens at 5 miles per hour or 525-575 R.P.M. of the armature. Adjust the spring tension on the relay armature so that the contacts open when the discharge current is 0-3 amperes. Adjust the air gap between the relay armature and coil core so that the contacts close when the voltage of the generator reaches 6.2 to 6.5 volts. Air gap between relay armature and coil core is .005 inch, contacts closed. Contacts separate .030 to .035 inch. Resistance of the shunt winding of the relay is 68 ohms. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp.

FUSES.—Fuses are 10 amperes.

Plate No. 522

FRANKLIN

SERIES 9-B, LATE 1921-1922 MODEL

NORTH-EAST GENERATING, STARTING AND LIGHTING SYSTEM

ATWATER KENT IGNITION

BATTERY.—Willard, Type SXR-27, 12 volt, 60 ampere-hour. The two-wire system is used.

IGNITION.—Type CAF. Breaker contacts separate .006 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

Oiling.—Remove the distributor cap and put 4 or 5 drops of light engine oil in the exposed oil hole every two weeks. Put a small amount of vaseline on the cam applying with a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

Timing.—Breaker contacts separate when the top dead center mark $\frac{1-6}{1-6}$ on the fly-wheel is $1\frac{1}{2}$ inches before the indicator, breaker fully retarded. Spark control is automatic.

Firing Order.—The firing order is 1, 4, 2, 6, 3, 5.

Spark Plug Gaps.—Spark plug gaps are .032 inch.

STARTER-GENERATOR.—Model GF, Type 24841. Armature shaft is chain connected to the engine crankshaft. The lock torque is 45 pound-feet.

Starter Data—Model GF

Torque	R.P.M.	Amperes
5 pound feet	420	37
8 pound feet	360	53
12 pound feet	300	75
17 pound feet	240	99

Current when locked is 240 amperes. The brush tension of all brushes is $1\frac{1}{2}$ pounds.

GENERATOR.—Generator current regulation is by the third brush system. Generator begins to supply current at 9 miles per hour. The maximum charging rate is 12 amperes, reached at 18 to 20 miles per hour, or 1500 R.P.M. of the armature.

Generator Data—Model GF

Amperes	R.P.M.	Amperes	R.P.M.
	Hot Test		Cold Test
0	780	0	730
6	1050	6	930
8	1200	10	1130
10	1750	12	1500
9	2500	10	2760

Oiling.—Put 4 or 5 drops of light engine oil in the rear bearing oiler of the starter-generator every month. If the car is driven more than 1000 miles in a month, the oiling must be done every 1000 miles.

RELAY.—There is no relay. The circuit between the generator and battery is controlled by the starting switch.

LAMPS.—Head lamps are 14 volt, 21 cp. Dimmer, dome and tonneau lamps are 14 volt, 4 cp. Dash and tail lamps are 8 volt, 2 cp.

FUSES.—Fuses are 10 ampere.

Plate No. 523

NASH FOUR

MODEL 41 (1921)

WAGNER GENERATING, STARTING, AND LIGHTING SYSTEM WAGNER IGNITION

BATTERY.—Willard, Type SJWN-3, 6 volt, 90 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Coil Model K-70, Distributor Model K-84. Breaker contacts separate .020 to .025 inch. When the condition of the contact affects the ignition, renew the lever arm and contact screw.

Oiling.—Screw up the grease cup under the breaker head one-half turn every two weeks. If the car is driven more than 500 miles in two weeks, this must be done every 500 miles. Put 3 or 4 drops of light engine oil on the wick in the breaker lever spindle every 6 months.

Timing.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plug Gaps.—Spark plug gaps are .025 to .030 inch.

STARTER.—Model E.M.-353, Type 36-T. Starter is connected to the engine through a set of reduction gears meshed by the operator. An overrunning clutch is provided which permits the starter to turn the engine but prevents the latter from turning the starter through the reduction gears. Starter cranks the engine at 100 to 125 R.P.M. the current being 150 to 175 amperes. Lock torque is 11.5 pound-feet, current 475 amperes. Running freely starter takes 60-90 amperes, armature revolving 8000 R.P.M.

Oiling.—Put 5 or 6 drops of light engine oil in each of starter oilers every month. Remove the plug in the reduction gear housing and inject Gredag grease every six months.

GENERATOR.—Model No. E.M.-337. Generator current regulation is by the third brush system. Maximum charging rate is 12 amperes, reached at 18-23 miles per hour.

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Model 1-471. Relay closes at 8-10 miles per hour or 640-800 R.P.M. of the armature, and opens at 6-8 miles per hour or 480-640 R.P.M. of the armature. Charging current at closing is 2 amperes, and the discharge current is 0-4 amperes at opening of relay contacts. Relay contacts separate .035 to .065 inch. Air gap between relay armature (moving member) and coil core is .025 inch, contacts closed. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No.00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 15 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp.

FUSES.—Fuses are 20 ampere.

DORRIS (1921-22)
WESTINGHOUSE MOTOR AND GENERATOR
BOSCH MAGNETO

Plate No. 524

DORRIS

MODEL 6-80 (1921-22)

WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM BOSCH MAGNETO IGNITION

BATTERY:—Willard, Type SJRG-5, 6 volt, 139 ampere-hour. The positive (+) terminal is grounded.

IGNITION:—Type DU-6. Breaker contacts separate .014 to .016 inch. When the condition of the points affects the ignition, resurface with a fine, flat jeweler's file or worn sandpaper.

Oiling.—Put 3 or 4 drops of light engine oil in each of the magneto oilers every month. Put a very small amount of vaseline on the fiber bumper of the contact arm, applying with a toothpick. If the car is driven more than 1000 miles in a month, these attentions must be given every 1000 miles.

Timing.—Breaker contacts begin to separate when the piston entering the power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—Spark plug gaps are .018 to .023 inch.

STARTER.—Frame No. 751. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. The brush tension of each brush should be from 2½ to 3½ pounds.

Starter Data

2.5 lb. ft.	1450	140
7.5 lb. ft.	1150	200
12.5 lb. ft.	650	400
17.5 lb. ft.	500	530
21.0 lb. ft.	Lock	650

Oiling.—Put 5 or 6 drops of light engine oil in each of the starter oilers every month.

GENERATOR.—Frame No. 760. Generator current regulation is by the third brush system. Maximum current output is 15-17 amperes, reached at 1250 R.P.M. of the armature of 16-20 miles per hour. The direction of rotation is counter-clockwise, looking at the commutator end.

Generator Data

Amperes	Cold Test	R.P.M.	Amperes	Hot Test	R.P.M.
0		450	0		500
8		675	6		725
12		840	9		850
15-17		1250	12-14		1250
10		2000	7-8		2000

The cold test readings are obtained with a generator temperature under 95° F. The hot test readings are obtained after the generator has been operating 1 hour at 1800 R.P.M., charging a half-charged battery. Shunt field current is 2.8 to 3.25 amperes when 6 volts pressure is applied to its terminals. When the generator is operating freely as a motor, current is 3.5 to 5 amperes at 6 to 6.3 volts. Generator output is adjusted by shifting the third brush. Shifting the third brush in the direction of armature rotation increases the output and in the opposite direction decreases it.

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted on the dash. Relay closes at 500-550 R.P.M. of the armature or 7-9 miles per hour and opens at 450-500 R.P.M. of the armature or 5-7 miles per hour. Adjust the spring tension on the relay armature so that the contacts open with a discharge current of 0-3 amperes. Adjust the air gap between the relay armature and coil core so that the contacts close when the voltage of the generator reaches 6.2 to 6.5 volts. Air gap between relay armature and coil core is .005 inch, contacts closed. Contacts separate .030 to .035 inch. Resistance of the shunt coil is 68 ohms. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS:—Head lamps are 6-8 volt, 32 cp. Dimmer lamps are 6-8 volt 4 cp. Cowl, dash, tonneau, tail and inspection lamps are 6-8 volt, 2 cp.

FUSES.—Generator field fuse is 5 ampere. All other fuses are 15 ampere capacity.

Plate No. 525

CLEVELAND

MODEL 40 (1921)

BOSCH GENERATING, STARTING AND LIGHTING SYSTEM BOSCH MAGNETO IGNITION

BATTERY.—Prest-O-Lite, Type 611 RHN, 6 volt, 94 ampere-hour. The positive (+) is grounded.

IGNITION.—Bosch, Type B-6. Breaker contacts separate .014-.016 inch. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

Oiling.—Put 2 or 3 drops of light engine oil in each of the magnet oilers every two weeks. Put a small amount of vaseline on the fiber bumper of the contact arm, applying with a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

Timing.—Breaker contacts begin to separate when the flywheel marking "DC 1 & 6" is opposite the mark on the hole in the flywheel housing, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—Spark plug gaps are .025 inch.

STARTER.—Model No. 900. Starter is connected to the engine through a Bendix drive. Starter cranks the engine at 80 R.P.M., taking 150 amperes. Running freely starter current is 45-50 amperes. Lock torque is 15 pound-feet.

Oiling.—Put 5 or 6 drops of light engine oil in each of the starter bearing oilers every month.

GENERATOR.—Model No. 1000. Direction of rotation is counterclockwise, looking at the commutator end. Current regulation is by the third brush system. The maximum charging rate is 15 amperes, reached at 1500 R.P.M. of armature, or 25 miles per hour.

Generator Test Data.—Model 1000

Hot Test		Cold Test	
Cut In	550	Cut In	525
6	900	8	825
12	1600	15	1600

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted on the generator frame. Relay closes at 7-9 miles per hour and opens at 5-7 miles per hour. Contacts separate .012 to .015 inch. Air gap between relay armature and coil core is .018 inch. Charging current is 1-2 amperes at closing, and the discharge current 0-2 amperes at opening of relay. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 15 cp. Dash and tail lamps are 6-8 volt, 2 cp.

FUSES.—Lighting fuse is 20 ampere. Generator fuse is 5 ampere.

Plate No. 526

PIEDMONT MODEL 4-30 (1920-21) DYNETO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

- BATTERY.**—Willard, 6 volt, 90 ampere-hour. The positive (+) terminal is grounded.
- IGNITION.**—Breaker contacts separate .020 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.
- OILING.**—Put 4 or 5 drops of light engine oil in the ignition unit oilers every two weeks. If the track of the rotor button in the distributor head is not well polished, apply a small amount of vaseline with a soft cloth.
- TIMING.**—Breaker contacts begin to separate when the top dead center mark on the fly-wheel is $\frac{3}{4}$ inch past the indicator, spark control lever and breaker assembly in the fully retarded position.
- FIRING ORDER.**—The firing order is 1, 3, 4, 2.
- SPARK PLUG GAPS.**—Spark plug gaps are .025 inch.
- STARTER.**—Model No. D-367. Starter is connected to the engine through a Bendix drive. When cranking engine, starter takes 130 amperes, armature revolving at 1500 R.P.M.

Starter Data			
0.0 lb. ft.	5600	25	6.4
2.5 lb. ft.	1400	150	5.8
5.0 lb. ft.	850	250	5.3
10.0 lb. ft.	250	420	4.6
14.0 lb. ft.	Lock	530	4.0

- OILING.**—Put several drops of light engine oil in starter oilers every month.
- GENERATOR.**—Model C-162. Generator current regulation is by the third brush system. Maximum current output is 12-15 amperes, reached at 1200 R.P.M. of the armature or 20-25 miles per hour.

Generator Data					
Amperes	Cold Test	R.P.M.	Amperes	Hot Test	R.P.M.
6		600	5		600
13		900	10		900
15		1200	12		1200
13.5		1600	11.5		1600
11.5		2000	10		2000

- Shunt field current is 3.5 amperes at 6.5 volts. Charging rate is varied by adjustment of the third brush setting. Remove the leather plug in the commutator end of the generator, loosen the screw exposed and move in the direction of armature rotation to increase the charging rate. Move in the opposite direction to decrease the charging rate. Tighten the adjusting screw and replace the leather plug after adjustment is made.
- OILING.**—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.
- RELAY.**—Relay closes at 8-10 miles per hour or 450-500 R.P.M. of armature, and opens at 6-8 miles per hour or 400-450 R.P.M. of armature. Relay contacts separate $\frac{3}{32}$ inch. Air gap between relay armature and coil core is $\frac{1}{8}$ inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.
- LAMPS.**—Head lamps are 6-8 volt, 12 cp. Dash and tail lamps are 6-8 volt, 2 cp.

Plate No. 527

PATERSON

MODEL 6-46 & 6-46-R (1920-21-22) SERIAL NOS. 94490 UP.
DELCO GENERATING, STARTING AND LIGHTING SYSTEM
DELCO IGNITION

BATTERY.—Battery is 6 volt, 110 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Breaker contacts separate .020 inch. They are made of tungsten. When the condition of the points affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING.—Distributor shaft bearings are of the oilless type. If the rotor button and its track in the distributor head are not well polished, apply a small amount of vaseline with a soft cloth.

TIMING.—Breaker contacts begin to separate when piston entering power stroke is or top dead center, spark control one-third advanced.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .030 inch.

STARTER.—Model No. 106. Starter is connected to the engine through a Bendix drive. Operating freely, current is 40 amperes. Lock torque is 16 pound-feet, with 3.5-3.8 volts.

OILING.—Starter bearings are of the oilless type.

GENERATOR.—Model No. 105. Generator current regulation is by third brush system. Generator begins to supply current at 6-8 miles per hour or 500 R.P.M. of armature and reaches its maximum output at 18-22 miles per hour, or 1400 R.P.M. of armature.

Hot Test		Generator Data		Cold Test	
Amperes	R.P.M.			Amperes	R.P.M.
Neutral	500			Neutral	500
10-12	900			10.5-12.5	900
14-16	1400			15.5-18.0	1400
11-13	2000			13.0-17.0	2000

To increase charging rate loosen the two screws holding third brush arm and move third brush in a counter-clockwise direction (looking at commutator end). To decrease charging rate move third brush in a clockwise direction. Brush must be re-seated after adjusting position.

OILING.—Put 5 or 6 drops of light engine oil in each of generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—There is no relay. The circuit between the generator and the battery is controlled by the ignition switch. The overrunning clutch at driving end allows generator to operate as a motor when battery's pressure is above that of generator. If engine is killed when stopping, the noise made by the clutch serves to attract the operator's attention to open the ignition switch. The opening and closing of the generator-battery circuit by the operator takes the place of the relay.

LAMPS.—Head lamps are 6-8 volt, 15 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp.

CIRCUIT BREAKER.—A vibrating circuit breaker takes the place of fuses. It requires 25 amperes to start this device vibrating. While vibrating, the current is 3 to 5 amperes.

Plate No. 528

PORTER MODEL 46 (1920-21-22) SERIAL NOS. 100 UP. WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM BERLING IGNITION

BATTERY.—Prest-O-Lite, 613-RHV, 12 volt, 118 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Breaker contacts separate .016 to .020 inch. They are made of platinum. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper. See that the brush in the back of the breaker base makes a good contact with the surface on which it rubs.

OILING.—Put 10 drops of light engine oil in each of the magneto oil cups every month. Put a small amount of vaseline on the cam and rubbing surfaces of the fiber lever, applying with a toothpick. If the car is driven more than 1000 miles in a month, these attentions must be given every 1000 miles.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 3, 4, 2.

SPARK PLUG GAPS.—The spark plug gaps are .028 inch.

STARTER.—Frame 751. Starter is connected to the engine through a Bendix drive. Starter cranks the engine at 120-200 R.P.M., taking 180 amperes. Lock torque is 20 pound-feet, current being 575 amperes at 5.5 volts. Torque at 2200 R.P.M. is 3.5 pound-feet, current being 195 amperes at 10.5 volts. Running freely, starter takes 35-55 amperes at 5.5 volts, armature revolving at 3500-5500 R.P.M. The no-load test must be made with a 6 volt battery. Pressure of brushes on the commutator is 2.5 to 3 pounds.

OILING.—Put 5 or 6 drops of light engine oil in the starter oilers every month.

GENERATOR.—Frame 765. Generator current regulation is by the third brush system. Maximum current output is 9-10 amperes at 13 volts, reached at 750-950 R.P.M. of the armature or 20 miles per hour. Charging rate is varied by adjustment of the third brush setting.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 9 miles per hour or 390-420 R.P.M. of the armature, and opens at 7 miles per hour or 360-390 R.P.M. of the armature. To adjust the relay, vary the spring tension until the relay opens with a discharge current of 0-3 amperes. Then bend the armature stop (which determines the air gap between the armature and coil core) until the contacts close when the voltage of the generator reaches 12.4-13 volts. Air gap between relay armature and coil core is .005 inch, contacts closed. Contacts separate .030 to .035 inch. The resistance of the shunt winding of the relay is 274 ohms. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 12-16 volt, 20 cp. Dimmer and tail lamps are 12-16 volt, 4 cp. Dash lamp is 12-16 volt, 2 cp.

FUSES.—Generator fuse is 5 ampere. Lighting circuit fuses are 15 ampere.

COLUMBIA

SERIES 7-R (1921)

AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM ATWATER KENT IGNITION

BATTERY.—Prest-O-Lite, Type RHN-611, 6 volt, 120 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Type CC. Breaker contacts separate .005 to .008 inch. They are made of tungsten. When the condition of the points affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

Oiling.—Every two weeks, remove the distributor head and put several drops of light engine oil in the oil hole exposed. Put a very small amount of vaseline on the cam, applying with a toothpick. If car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

Timing.—Breaker contacts begin to separate when piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—Spark plug gaps are .030 inch.

STARTER.—Model MH-1019. Starter is connected to the engine through a Bendix drive.

Starter Data

Torque	R.P.M.	Amperes
2 lb. ft.	1160	110
4 lb. ft.	880	170
6 lb. ft.	700	225
8 lb. ft.	580	275
10 lb. ft.	460	325
12 lb. ft.	375	365
17.5 lb. ft.	Lock	600

Oiling.—Put 4 or 5 drops of light engine oil in each of starter bearing oilers every month.

GENERATOR.—Model GJ-1025V. Generator current regulation is by the third brush system.

Generator Data

Charging battery of 1300 Spec. Gravity		Generator Temperature 165°F.	
Generator Temperature 77°F.		Hot Test	
Cold Test	R.P.M.	Amperes	R.P.M.
0.0	500	0.0	550
4.0	600	4.0	730
8.0	750	6.0	850
12.0	950	8.0	950
16.0	1400	12.0	1350
16.5	1600	12.6	1700
15.0	2400	11.6	2400
13.0	3000	10.6	3000

Maximum charging rate is reached at 20-25 miles per hour or 1600-1700 R.P.M. of the armature.

Oiling.—Put 4 or 5 drops of light engine oil in each of generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 6-9 miles per hour and opens at 4-7 miles per hour. Charging current is 1-3 amperes at closing, and discharge current .5 to 1.5 amperes at opening of relay contacts. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 15 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp.

SCRIPPS-BOOTH

SERIES B (1920-21)

REMY GENERATING, STARTING AND LIGHTING SYSTEM

REMY IGNITION

BATTERY.—Prest-O-Lite, 6 volt, 85 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Breaker contacts separate .022 inch. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Refill the grease cup under the breaker head with soft cup grease and turn down two turns every two weeks. Put a small amount of vaseline on the fiber bumper of the contact arm, applying with a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when the top dead center mark on the fly-wheel is $\frac{1}{2}$ inch past the indicator, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK-PLUG GAPS.—Spark plug gaps are .025 to .030 inch.

STARTER.—Model No. 701-A. Starter is connected to the engine through a Bendix drive.

Starter Data			
Torque	R.P.M.	Amperes	Volts
0 lb. ft.	10,000	65	5.7
2 lb. ft.	2250	175	5.1
6 lb. ft.	750	365	4.2
10 lb. ft.	225	500	3.5
12 lb. ft.	Lock	575	3.2

Above tests are made without gear reduction. Pressure of brushes on the commutator is 20-24 ounces.

OILING.—Put 5 or 6 drops of light engine oil in each of the starter oilers every month.

GENERATOR.—Model 911-A. Generator current regulation is by the third brush system.

A thermostat, located in the brush rigging of the generator, cuts a resistance into the shunt field circuit of the generator at a temperature of 175°F., reducing maximum charging rate 8 amperes. Never touch the thermostat points. Maximum charging rate is 20 amperes with the thermostat closed, reached at 1800 R.P.M. of the armature or 25 miles per hour.

Generator Data			
Cold Test. Thermostat Closed	Hot Test. Thermostat Open		
Amperes	R.P.M.	Amperes	R.P.M.
0	600	0	800
5	750	4	1100
10	950	6	1250
14	3200	9	3200
15	1200	8	1450
20	1800	11	2000

Charging rate is varied by adjustment of the third brush setting. Third brush assembly is moved by turning a screw exposed in the commutator end plate. Pressure of main brushes on the commutator is 17-20 ounces. Pressure of the third brush is 13-17 ounces.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 8-10 miles per hour or 600-650 R.P.M. of the armature and opens at 6-8 miles per hour or 550-600 R.P.M. of the armature. Relay contacts separate .020 inch. Air gap between relay armature and coil core is .020 inch, contacts closed. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 18 cp. Dash and tail lamps are 6-8 volt, 2 cp.

Plate No. 530

BUICK

MODEL 22-FOUR (1922)

DELCO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

BATTERY.—Exide, Type 3-XC-13-1, 6 volt, 84 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 2159. Distributor is integral with the motor-generator. Breaker contacts separate .0225 to .0275 inch. They are made of tungsten. When the condition of the contacts affects the ignition, they must be removed and resurfaced with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone. The condenser is mounted within the breaker housing, and the resistance unit on the side of the housing.

Oiling.—See motor-generator oiling.

Timing.—Breaker contacts begin to separate when the seven-degree mark on the fly-wheel (which is approximately one inch after top dead center) is at the indicator, spark control lever and distributor drive shaft in the fully retarded position.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plugs.—Diameter, $\frac{7}{8}$ inch. Spark gaps are .030 inch.

STARTER-GENERATOR.—Model No. 231. Starter and generator are combined into one unit, but are electrically separate. Starter is connected to the engine through a set of reduction gears meshed by the operator. Two overrunning clutches are provided. In connection with ignition switch, a circuit is closed, allowing the current to flow through the generator windings, causing the armature to revolve slowly, aiding the meshing of the reduction gears. One clutch permits this rotation, and also permits a relatively high speed of the armature, necessary when operating as a starter. The second overrunning clutch prevents the engine from driving the armature through the reduction gears. Depressing the starting pedal meshes the reduction gears opens the generator circuit, and allows the motor brush to come in contact with the commutator, closing the starter circuit and cranking the engine. When the pedal is released, a spring reverses these operations.

GENERATOR.—Generator current regulation is by the third brush system. The maximum charging rate should not exceed 18 amperes, hot adjustment, under any circumstances. To adjust the charging rate loosen clamp screw on third brush carrier (to right of bearing, looking at commutator end). Move carrier to left to increase charging rate, and to the right to decrease the charging rate. Tighten the clamp screw after position adjustment.

Test Data

Amperes	R.P.M.	M.P.H.
8-9	825	
0	600	
Max. 14-16	1500	20
12-15	1800	

Motoring freely at 250 R.P.M., taking 5-6 amperes, 6 volts, with over running clutch.

FIELD TEST.—Field draws 1.5-2 amperes, 6 volts.

Oiling.—Put 4 or 5 drops of light engine oil in oiler provided for lubricating the rear armature shaft bearing every two weeks. Remove the front end cover over the commutator and put 3 or 4 drops of light engine oil in the exposed oil hole. Put 4 or 5 drops of light engine oil in the upper distributor shaft bearing oiler. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles. Refill starting gear grease cup with soft cup grease and turn down two turns every month. Every six months, remove the plate on the side of the distributor housing and refill with soft cup grease to a level just above the manual advance ring.

RELAY.—There is no relay. The circuit between the generator and the battery is controlled by the ignition switch. The overrunning clutch at the driving end allows generator to operate as a motor when battery's pressure is above that of generator. If engine is killed when stopping, the noise made by the clutch serves to attract the operator's attention to open the ignition switch. The opening and closing of the generator-battery circuit by the operator takes the place of the relay.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dome lamp is 6-8 volt, 5 cp. Dash and tail lamps are 6-8 volt, 2 cp.

CIRCUIT BREAKER.—A vibrating circuit breaker takes the place of fuses. It requires 25 amperes to start the vibrator, but 3-5 amperes will cause it to continue.

COMBINATION SWITCH.—Model No. 1159. A vibrating circuit breaker, mounted on the rear of switch, takes the place of fuses. It requires 25 amperes to start the vibrator. While vibrating the current is 3-5 amperes.

Plate No. 533

SENECA

MODELS L, O, AND M (1921)

ALLIS-CHALMERS GENERATING, STARTING AND LIGHTING SYSTEM

CONNECTICUT IGNITION

BATTERY.—Prest-O-Lite, Type RHN-611, 6 volt, 80 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Coil Model XA91. Distributor Model XA39. Breaker contacts separate .027 inch. They are made of tungsten. When the condition of the contacts affects the ignition, renew the inner breaker mechanism. For temporary service resurface contacts with fine emery cloth.

Oiling.—Refill the grease cup under the distributor head with pure vaseline and turn down every month. If the car is driven more than 1000 miles in a month, this must be done every 1000 miles. Do not put grease or oil in the cup.

Timing.—Breaker contacts begin to separate when the top dead center mark on the fly-wheel is $\frac{1}{2}$ inch past the indicator, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plug Gaps.—Spark plug gaps are .027 inch.

STARTER-GENERATOR.—Model No. MG9-L. The unit is permanently connected to the engine crankshaft. Acting as a starter, it cranks the engine at 50 R.P.M., taking 120-150 amperes.

Starter Data

Torque	R.P.M.	Amperes
0 lb. ft.	1200	10
5 lb. ft.	600	110
10 lb. ft.	400	190
15 lb. ft.	260	265
20 lb. ft.	150	340
28 lb. ft.	Lock	450

GENERATOR.—Generator current regulation is by vibrating regulator. Maximum charging rate is 15 amperes, reached at 2000 R.P.M. of the armature or 25 miles per hour. Shunt field winding takes 2.5 amperes at 6-7 volts.

Oiling.—Put 3 or 4 drops of light engine oil in each of starter-generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles. Thoroughly clean out and repack bearings with soft cup grease once a year.

RELAY.—Relay closes at 10-12 miles per hour or 1000-1200 R.P.M. of the armature and opens at 8-10 miles per hour or 800-1000 R.P.M. of the armature. Relay contacts separate .030 inch. Air gap between relay armature and coil core is $\frac{1}{16}$ inch. Clean relay and regulator contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 18 cp. Dash and tail lamps are 6-8 volt, 2 cp.

FUSE.—None.

Plate No. 534

GARDNER

LATE MODEL G (1921)

WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM WESTINGHOUSE IGNITION

BATTERY.—Willard, Type SJWN-3, 6 volt, 94 ampere-hour. The positive (+) terminal is used.

IGNITION.—Type SC. Coil Model No. 288,761. Distributor Model No. 290,356. Breaker contacts separate .012 to .016 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone. The bumper on the contact spring is $\frac{1}{8}$ inch off center from the line through the centers of the shaft and terminal screw, this offset being opposite to the direction of rotation of the cam. The above adjustment is made by bending the solid arm to the terminal block. A pull of 20 to 25 ounces, applied to the movable contact is required to separate the contacts .020 inch. The spring pressure is adjusted by bending the solid arm at the point of contact with the contact arm. Resistance of the primary winding of the ignition coil is 1 ohm. The resistance of the ballast resistor is .4 ohm. Resistance of the secondary winding is 3700-4700 ohms.

Oiling.—Put 4 or 5 drops of light engine oil in the oiler at the side of the breaker box every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Timing.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plug Gaps.—Spark plug gaps are .025 inch.

STARTER.—Frame No. 33AB. Style 265,774-C. Rotation is counter-clockwise, looking at commutator end. Starter is connected to the engine through a Bendix drive.

Starter Test Data.—No. 33AB.

0.00 lb. ft.	3700-4100	5.5	70
1.75 lb. ft.	1600	5.5	150
12.00 lb. ft.	Lock	3.7	500

The brush tension is 2 to 3 lbs.

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator oilers every month.

GENERATOR.—Frame No. 760. Generator current regulation is by the third brush system. Maximum current output is 15-17 amperes, reached at 1250 R.P.M. of the armature or 16-20 miles per hour.

Generator Data

Amperes	Cold Test	R.P.M.	Amperes	Hot Test	R.P.M.
0		450	0		500
8		675	6		725
12		840	9		850
15-17		1250	12-14		1250
10		2000	7-8		2000

The cold test readings are obtained with a generator temperature under 95° F. The hot test readings are obtained after the generator has been operated one hour at 1800 R.P.M., charging a half-charged battery. Shunt field current is 2.8 to 3.25 amperes when 6 volts pressure is applied to its terminals. When the generator is operating freely as a motor, current is 3.5 to 5 amperes at 6 to 6.6 volts.

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Style 293899C. Relay closes at 500-550 R.P.M. of the armature or 7-9 miles per hour and opens at 450-500 R.P.M. of the armature or 5-7 miles per hour. Adjust the spring tension on the relay armature so that the contacts open with a discharge current of 0-3 amperes. Adjust the air gap between the relay armature and coil core so that the contacts close when the voltage of the generator reaches 6.2 to 6.5 volts. Air gap between relay armature and coil core is .005 inch, contacts closed. Contacts separate .030 to .035 inch. Resistance of the shunt coil is 68 ohms. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 17 cp. Dash and tail lamps are 6-8 volt, 2 cp.

FUSES.—Generator fuse is 5 ampere. Lighting fuses are 20 ampere.

Plate No. 535

DUPONT

MODEL A (1920-21)

WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM EISEMANN MAGNETO IGNITION

BATTERY.—Exide, Type 3-XC-15-1, 6 volt, 105 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Breaker contacts separate .015 inch. They are made of platinum. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or well worn No. 00 sandpaper.

Oiling.—Put 2 or 3 drops of light engine oil in the oil wells every month. Put a small amount of vaseline on the fibre bumper of the contact arm, applying with a toothpick. If the car is driven more than 1000 miles in a month, these attentions must be given every 1000 miles.

Timing.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control in the fully retarded position.

Firing Order.—The firing order is 1, 2, 4, 3.

Spark Plug Gaps.—The spark plug gaps are .030 inch.

STARTER.—Frame 100. Rotation is counter-clockwise, looking at commutator end. Starter is connected to the engine through a Bendix drive. Lock torque is 12 pound-feet current being 475 amperes at 4 volts. Torque at 1600 R.P.M. is 1.75 pound-feet. Running freely, starter takes 75 amperes, armature revolving at 4000 R.P.M.

Oiling.—Put 5 or 6 drops of light engine oil in the starter oilers every month.

GENERATOR.—Frame No. 150. Rotation is counter-clockwise, looking at commutator end. Generator current regulation is by the third brush system. Maximum current output is 15-16 amperes at 7.5 volts, reached at 1450-1750 R.P.M. of the armature or 15-20 miles per hour.

Generator Data

Amperes	R.P.M.	Volts
0.0	575	6.5
8.5-10.5	1000	7.0-7.5
15.0-16.0	1450-1750	7.5

Shunt field winding takes 3.25 to 4 amperes at 6 to 6.3 volts. Move the third brush in a counter-clockwise direction to increase the charging rate, and in a clockwise direction to decrease the charging rate.

Oiling.—Put 5 or 6 drops of light engine oil in the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—The relay is mounted on the dash. Relay closes at 7 miles per hour or 575-600 R.P.M. of the armature, and opens at 5 miles per hour or 525-575 R.P.M. of the armature. Adjust the spring tension on the relay armature so that the contacts open with a discharge current of 0-3 amperes. Adjust the air gap between the relay armature and coil core is .005 inch, contacts closed. Contacts separate .030 to .035 inch. Resistance of the shunt coil is 68 ohms. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp.

FUSES.—Generator fuse is 5 ampere. Lighting fuse is 25 ampere.

DIXIE FLYER
DYNETO MOTOR AND GENERATOR
EISEMANN MAGNETO

Plate No. 536

DIXIE FLYER
MODEL H, SERIES 7000 (1921-22)
DYNETO GENERATING, STARTING AND LIGHTING SYSTEM
EISEMANN MAGNETO IGNITION

BATTERY.—Willard, Type SJR-4, 6 volt, 80 ampere-hour. The two-wire system is used.
IGNITION.—Breaker contacts separate .015 inch. They are made of platinum. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or well worn No. 00 sandpaper.

Oiling.—Put 3 or 4 drops of light engine oil in each of the magneto oilers every month. Put a very small amount of vaseline on the fiber bumper of the contact arm, applying with a toothpick. If the car is driven more than 1000 miles in a month, these attentions must be given every 1000 miles.

Timing.—Breaker contacts begin to separate when the piston entering the power stroke is on top dead center, spark control lever and magneto breaker assembly in a fully retarded position.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plug Gaps.—Spark plug gaps are .030 inch.

STARTER.—Model No. D69-D284. Starter is connected to the engine through a Bendix drive.

Starter Data

Torque	R.P.M.	Amperes	Volts
0.0 lb. ft.	5600	25	6.4
2.5 lb. ft.	1400	150	5.8
5.0 lb. ft.	850	250	5.3
10.0 lb. ft.	250	420	4.6
14.0 lb. ft.	Lock	530	4.0

Oiling.—Put several drops of light engine oil in starter oilers every month.

GENERATOR.—Model No. C69-C284. Generator current regulation is by the third brush system. Maximum current output of 14 amperes is reached at 16-18 miles per hour or 1500 R.P.M. of armature.

Generator Data

Amperes	M.P.H.	Volts
0	7-9	6.4
5	9-10	6.6
10	12-14	6.8
12-14	16-18	7.8
8	40-45	6.7

Charging rate may be varied by adjusting the third- brush setting. Shunt field current is 3.5 amperes at 6.5 volts.

Oiling.—Put 4 or 5 drops of light engine oil in the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 8-10 miles per hour or 450-500 R.P.M. of armature, and opens at 6-8 miles per hour or 400-450 R.P.M. of armature. Relay contacts separate $\frac{3}{32}$ inch. Air gap between relay armature and coil core is $\frac{1}{8}$ inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 or 32 cp. Dash and tail lamps are in series. They are 3-4 volt, 2 cp.

FUSES.—Generator fuse is 5 ampere. Lighting fuses are 10 ampere.

ANDERSON
Series 30 and 40 (1920-21-22)
Remy System

Plate No. 537

ANDERSON SERIES 30 (1920) AND 40 (1921-22) REMY GENERATING, STARTING AND LIGHTING SYSTEM REMY IGNITION

BATTERY:—1920-21 Willard, Type SJW-N4, 6 volt, 111 ampere hour. 1922, Willard Type SJRN-4, 6 volt, 111 ampere hour. The positive (+) terminal is grounded.

IGNITION:—Breaker contacts separate .022 inch. When the condition of the contacts affects the ignition, resurface with a fine flat, jeweler's file or worn No. 00 sandpaper.

OILING:—Refill the cup under the distributor head with soft cup grease and turn down two turns every two weeks. Put a small amount of vaseline on the fiber bumper of the contact arm, applying with a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING:—Breaker contacts begin to separate when the top dead center mark on the fly-wheel is $\frac{1}{2}$ inch past the indicator, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER:—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS:—Spark plug gaps are .025 to .030 inch.

STARTER:—Model No. 705-A. Starter is connected to the engine through a Bendix drive. Starter cranks the engine at 250 R.P.M.

Starter Data			
Torque	R.P.M.	Amperes	Volts
0 lb. ft.	10000	65	5.0
1 lb. ft.	3000	145	5.4
4 lb. ft.	1000	310	4.5
5 lb. ft.	800	350	4.4
12 lb. ft.	Lock	600	3.0

Above tests are made without the reduction gears.

OILING:—Put 5 or 6 drops of light engine oil in each of the starter oilers every month.

GENERATOR:—Model No. 234-E. Generator current regulation is by the third brush system. A thermostat, located in the brush rigging of the generator, cuts a resistance into the field circuit at a temperature of 175°F., reducing the charging rate 6 amperes. The thermostat is intended to change the charging rate as the demands of seasons or car operation requires. Never touch the thermostat points. Maximum current output is reached at 2000 R.P.M. of the armature or 28 miles per h. ur.

Generator Data		
Amperes	R.P.M.	Volts
0	525	6.4
7	780	7.1-7.2
19.5-20.5	1680	8.6
14	1100	7.8
19.0-20.0	2000	8.6
13.0-15.0	3000	8.0

Field winding takes 5 amperes at 6.4 volts. Pressure of main brushes on commutator is 17-20 ounces. Pressure of the third brush is 13-17 ounces. Position of third brush is adjusted by turning a screw exposed in the commutator end plate. Move the third brush in the direction of armature rotation to increase the charging rate, and in the opposite direction to decrease the charging rate. Reseat the brush after adjusting position.

OILING:—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY:—Relay closes at 8-10 miles per hour or 525-575 R.P.M. of the armature and opens at 7-9 miles per hour or 475-525 R.P.M. of the armature. Relay contacts separate .012-.015 inch. Air gap between relay armature and coil core is .012-.015 inch, contacts closed. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS:—Head lamps are 6-8 volt, 21 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt 2 cp. On 1920-21 cars, head lamps are 6-8 volt 20 cp.

FUSES:—Fuses are 5 ampere.

APPERSON

MODELS 8-18 (1918), 8-20 (1919-20-21) 8-22 (1922)
BIJUR GENERATING, STARTING AND LIGHTING SYSTEM
REMY IGNITION

BATTERY:—(8-18 and 8-20), Willard, Type SJWN-3, 6 volt 104.2 Ampere hour (8-22), Exide, 3-XC-15, 6 volt, 104.2 ampere hour. The two wire system is used.

IGNITION:—Coil Model No. 284-H. Distributor Model No. 367-C. Breaker contacts separate .022 inch. When the condition of the points affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper. Ignition current is $4\frac{1}{2}$ -5 amperes, engine idle, breaker contacts and ignition switch closed.

OILING:—Refill the cup under the distributor head with soft cup grease and turn down two turns every two weeks. Put a small amount of vaseline on the fiber bumper of the contact arm, applying with a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING:—Breaker contacts begin to separate when the top dead center mark on the fly-wheel is $\frac{1}{2}$ inch past the indicator, spark control lever and breaker assembly in the fully retarded position.

SPARK PLUG GAPS:—Spark plug gaps are .025 to .030 inch.

FIRING ORDER:—The firing order is 1, 6, 3, 5, 4, 7, 2, 8.

STARTER:—Type E.D.160, M-1114. Rotation is counter-clockwise, looking at commutator end. Lock torque is 16.5 pound-feet, current 665 amperes, 3.6 volts. Pressure of brushes on commutator is 25 ounces.

OILING:—Put 5 or 6 drops of light engine oil in each of the starter oilers every month.

GENERATOR:—Type L-61, M-1193. Rotation is counter-clockwise, looking at commutator end. Generator current regulation is by third brush system. Maximum charging rate is 15 amperes, reached at 20 miles per hour, or 1400 R.P.M. of armature. Charging rate is varied by inserting a special toothed wrench in the adjusting hole in the commutator end plate and shifting the third brush assembly through a ratchet engagement. Turn the adjusting wrench to the right (facing commutator end) to increase the charging rate, and to the left to decrease the charging rate. Maximum current output must not exceed 15 amperes at 1400-1600 R.P.M. Pressure of brushes on commutator is 14 ounces.

OILING:—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY:—Relay is mounted in generator frame. Relay closes at 8-9 miles per hour or 550-600 R.P.M. of armature, and opens at 6-7 miles per hour or 500-550 R.P.M. of armature. Relay contacts separate .045 inch. Air gap between armature (moving member) and coil core is .035 inch, contacts closed. To adjust relay, connect a voltmeter across the main brushes of the generator. Then insert a special socket wrench in the small adjusting hole in commutator end plate and adjust relay spring tension until the contacts close when the voltage reaches 6.5 volts. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS:—Head lamps are 6-8 volt, 18 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash, tail and tonneau lamps are 6-8 volt, 2 cp.

FUSE:—Fuse is 10 ampere.

Plate No. 539

HUDSON

SUPER-SIX MODEL O (1921-22)

DELCO GENERATING, STARTING AND LIGHTING SYSTEM

DELCO IGNITION

BATTERY.—Exide, Type EX-15-1, 6 volt, 105 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 2170. Distributor Model No. 5223. Breaker contacts separate .018 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

Oiling.—Put several drops of light engine oil in the distributor bearing oilers every two weeks. If the track of the rotor button in the distributor head is not well polished, apply a small amount of vaseline with a soft cloth. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles. Thoroughly clean out and repack the driving gear housing with soft cup grease every six months.

Timing.—Breaker contacts begin to separate when the flywheel mark "A—" is at the indicator, spark control lever and breaker assembly in the fully advanced position. The mark "A—" is one-half inch before the top dead center mark "DC1 & 6".

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—Spark plug gaps are .025 to .028 inch.

STARTER-GENERATOR.—Model No. 188. Starter and generator are combined into one unit. Starter is connected to the engine through a set of reduction gears meshed by the operator. Two overrunning clutches are provided. In connection with the ignition switch, a circuit is closed, allowing current to flow through the generator windings, causing the armature to revolve slowly, aiding the meshing of the reduction gears. One clutch permits this rotation, and also permits a relatively high speed of the armature, necessary when operating as a starter. The second overrunning clutch prevents the engine driving the armature through the reduction gears. Depressing the starter pedal meshes the reduction gears, opens the generator circuit, and allows the motor brushes to come in contact with the commutator, closing the starter circuit and cranking the engine. When the pedal is released, a spring reverses these operations.

GENERATOR.—Generator current regulation is by third brush system.

Amperes	Generator Data.	Model No. 188	R.P.M.
Neutral			600
6			800
10-12			1000
15			2000

Charging rate is varied by adjusting the third brush setting. Loosen the two screws in the third brush arm, and lengthen the arm to increase the charging rate. Shorten the arm to decrease the charging rate. Reseat the brush after adjusting position.

Oiling.—Put 5 or 6 drops of light engine oil in each of the starter-generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—There is no relay. The circuit between the generator and battery is controlled by the ignition switch.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dash and tail lamps are 6-8 volt, 2 cp.

On 1921 cars head lamps are 6-8 volt, 15 cp.

CIRCUIT-BREAKER.—A vibrating circuit-breaker takes the place of fuses. It requires a current of 25 amperes to start the vibrator, but 3-5 amperes will cause it to continue.

HOLMES SERIES 4 (1921-1922) DYNETO GENERATING, STARTING AND LIGHTING SYSTEM EISEMANN MAGNETO IGNITION

BATTERY.—Willard, Type SJR-27, 12 volt, 70 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Eisemann, Type GSA-6. Breaker contacts separate .012 to .015 inch. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Put 2 or 3 drops of light engine oil in each of the magneto oilers every month. If the car is driven more than 1000 miles in a month, the oiling must be done every 1000 miles.

TIMING.—Breaker contacts begin to separate when the top dead center mark on the fly-wheel is $1\frac{1}{2}$ inches before the indicator, spark control in the fully retarded position.

FIRING ORDER.—The firing order is 1, 4, 2, 6, 3, 5.

SPARK PLUG GAPS.—Spark plug gaps are .028 inch.

STARTER-GENERATOR.—Model K4R. Starter-generator is connected to the engine through a chain drive. Starter cranks the engine at 200 R.P.M., current being 60 amperes. Lock torque is 40 pound-feet, current being 210 amperes, at 10.5 volts. Torque at 400 R.P.M. is 9 pound-feet, current being 60 amperes at 11 volts. Running freely starter current is 6.5 amperes at 11.5 volts, armature revolving at 700 R.P.M.

GENERATOR.—Generator current regulation is by third brush system. Maximum charging rate is 12 amperes, reached at 1650 R.P.M. of the armature or 18-20 miles per hour. Generator begins to supply current at 850 R.P.M. of the armature or 9-10 miles per hour.

Amperes	Generator Data	R.P.M.
0		850
5		975
12		1650
8		4000

Oiling.—Put 4 or 5 drops of light engine oil in each of the starter-generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, this oiling must be done every 500 miles.

RELAY.—There is no relay. The circuit between the generator and battery is controlled by the starting and ignition switch.

LAMPS.—Head lamps are 12-16 volt, 21 cp. Dimmer lamps are 12-16 volt, 6 cp. Dash and tail lamps are each 12-16 volt, 2 cp. Tonneau lamp is 12-16 volt, 2 cp.

FUSES.—Fuses are 15 ampere.

HOLMES

MODEL I (1918-19-20)

SERIES 4 (1921), TWO WIRE

DYNETO GENERATING, STARTING AND LIGHTING SYSTEM

EISEMANN MAGNETO IGNITION

BATTERY.—Willard (1918-19). 12 volt, 100 ampere hour. (1920-21) Type SJR-27. 12 volt, 80 ampere hour. The two wire system is used.

IGNITION.—Eisemann, Type GSA-6. Breaker contacts separate .012 to .015 inch. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Put 2 or 3 drops of light engine oil in each of the magneto oilers every month. If the car is driven more than 1000 miles in a month, the oiling must be done every 1000 miles.

TIMING.—Breaker contacts begin to separate when the top dead center mark on the fly-wheel is $1\frac{1}{2}$ inches before the indicator, spark control in the fully retarded position.

FIRING ORDER.—The firing order is 1, 4, 2, 6, 3, 5.

SPARK PLUG GAPS.—Spark plug gaps are .028 inch.

STARTER-GENERATOR.—Model K4R. Starter-generator is connected to the engine through a chain drive. Starter cranks the engine at 200 R.P.M., current being 60 amperes. Lock torque is 40 pound-feet, current being 210 amperes, at 10.5 volts. Torque at 400 R.P.M. is 9 pound-feet, current being 60 amperes at 11 volts. Running freely starter current is 6.5 amperes at 11.5 volts, armature revolving at 700 R.P.M.

GENERATOR.—Generator current regulation is by third brush system. Maximum charging rate is 12 amperes, reached at 1650 R.P.M. of the armature or 18-20 miles per hour. Generator begins to supply current at 850 R.P.M. of the armature or 9-10 miles per hour.

Amperes	Generator Data	R.P.M.
0		850
5		975
12		1650
8		4000

Oiling.—Put 4 or 5 drops of light engine oil in each of the starter-generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, this oiling must be done every 500 miles.

RELAY.—There is no relay. The circuit between the generator and battery is controlled by the starting and ignition switch.

LAMPS.—Head lamps are 12-16 volt, 21 cp. Dimmer lamps are 12-16 volt, 6 cp. Dash and tail lamps are 12-16 volt, 2 cp. On the 1918-19-20 cars head lamps are 12-16 volt, 30 cp.

FUSES.—Fuses are 15 ampere.

Plate No. 542

DODGE

1919-20-21-22

NORTH-EAST GENERATING, STARTING AND LIGHTING SYSTEM DODGE-NORTH EAST IGNITION

BATTERY.—Willard, Type SJW-26, 12 volt, 51.4 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Coil Type 10,210. Distributor Model O, Type 10,004. Breaker contacts separate .020 inch. They are made of tungsten. When the condition of the points affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

Oiling.—Every two weeks refill the grease cup above the horizontal shaft and turn down one turn. If car is driven more than 500 miles in two weeks, this must be done every 500 miles.

Timing.—Breaker contacts begin to separate when the exhaust valve in cylinder No. 4 just closes, spark control lever and breaker assembly in the fully retarded position. This is the firing position for No. 1 cylinder.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plug Gaps.—The spark plug gaps are .030 inch.

STARTER-GENERATOR.—Model G. Type 3566. The direction of rotation is counter-clockwise, looking at the commutator end. Starter and generator are combined into one unit. The unit is chain-connected to the engine crank shaft. Adjust chain so as to permit 1/2 inch up and down play midway between the sprockets.

Starter Data

Torque	R.P.M.	Amperes
5 lb. ft.	460	45
10 lb. ft.	350	78
12 lb. ft.	295	92
15 lb. ft.	230	111
35 lb. ft.	Lock	210

GENERATOR.—Generator current regulation is by reverse series field and third brush system. Rotation is counter-clockwise, viewed from commutator end.

Generator Data

Amperes	Hot Test	R.P.M.	Amperes	Cold Test	R.P.M.
0.0		1000	0.0		940
4.0		1240	3.0		1090
6.0		1350	6.0		1200
7.5		1800	8.5		1800
7.0		3200	7.0		3400

Charging rate is varied by adjusting the third brush. The position of the brush is adjustable by a rack and pinion movement, operated by turning a screw, exposed in commutator end plate. The adjusting screw is the upper one. It is necessary to first loosen the lower screw one or two turns, in order to unlock the third brush plate. Turn the upper screw in a clockwise direction (looking at commutator end) to increase the charging rate, and in a counter-clockwise direction to decrease the charging rate. Tighten the lower screw after making the adjustment. Maximum current output must not exceed 10 amperes. Main and third brush tension is 2 to 2 1/2 lbs.

Oiling.—Put 4 or 5 drops of light engine oil in rear bearing oiler of starter-generator every 2000 miles.

RELAY.—Relay is mounted with the starting switch. Relay closes at 10 miles per hour, or 1050 R.P.M. of armature, and opens at 8 1/2 miles per hour, or 900 R.P.M. of armature. Relay contacts separate .030 inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 12-16 volt, 15 cp. Dash and tail lamps are each 12-16 volt, 2 cp. Dome lamp is 12-16 volt, 4 cp. All lamps have single contact base.

FUSES.—Field fuse, mounted in generator frame, is 10 ampere.

SERIES 1,2,3, AND 4 (1920-21-22-23)
DELCO GENERATING, STARTING AND LIGHTING SYSTEM
DELCO IGNITION

H. C. S.
Series 1,2,3,4, (1920-23)
Delco System

Plate No. 343

BATTERY.—Willard, 6 volt, 80 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 2170. Distributor Model No. 5246. Breaker contacts separate .018 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING.—Put 4 or 5 drops of light engine oil in the distributor shaft bearing every two weeks. If the track of the rotor button in the distributor head is not well polished, apply a small amount of vaseline with a soft cloth. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly one-third advanced.

SPARK PLUGS.—Diameter, $\frac{7}{8}$ inch. Spark gaps are .030 inch.

FIRING ORDER.—The firing order is 1, 3, 4, 2.

STARTER:—Model No. 187 or 185. The direction of rotation is counter-clockwise looking at the commutator end. Starter is connected to the engine through a Bendix drive. The lock torque is 14 pounds-feet.

OILING.—Put 5 or 6 drops of light engine oil in the starter oilers every month.

GENERATOR.—Model No. 186. Rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. Maximum charging rate is 14 amperes, reached at 1000 R.P.M. of the armature, or 16-20 miles per hour.

Amperes	Generator Data	R.P.M.
Neutral		285
9.5		500
14		1000
12.5		1400
10		2000

Charging rate is varied by adjustment of the third brush setting. To vary the charging rate, first loosen the clamp nut on the front end of the generator one or two turns. Then turn the third brush adjusting screw in a clockwise direction to increase the charging rate or in a counter-clockwise direction to decrease the charging rate. Tighten the clamp nut and reseal the brush after adjusting position. Maximum charging rate must not exceed 16 amperes.

OILING.—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted on the generator frame. Relay closes at 285-300 R.P.M. of the armature or 7-8 miles per hour, and opens at 250-285 R.P.M. of the armature or 5-6 miles per hour. Relay contacts separate .046 to .062 inch. Air gap between relay armature and coil core is .020 to .035 inch, contacts closed. To adjust relay, connect a voltmeter between the positive (+) generator brush and the ground. Then slowly speed up the generator and adjust the relay spring tension by bending the slowly speed up the generator and adjust the relay spring tension by turning the thumb nut, until the contacts close when the voltmeter indicates 7.5 volts. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

tail lamps are 6-8 volt, 2 cp. On the 1920 and 1921 cars head lamps are 6-8 volt, 15 cp.

CIRCUIT-BREAKER.—A vibrating circuit-breaker mounted on the back of the switch takes the place of fuses. It requires a current of 25-30 amperes to start this device vibrating. While vibrating, the current is 10-15 amperes.

Plate No. 544

COLE

MODEL 8-70 (1920-21-22)

DELCO GENERATING, STARTING AND LIGHTING SYSTEM

DELCO IGNITION

BATTERY.—Willard, Type SJRN-5, 6 volt, 125 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 2127. Breaker contacts separate .018 inch. They are made of tungsten. When the condition of the points affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING.—Put 4 or 5 drops of light engine oil in each of distributor shaft bearing oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

TIMING.—Breaker contacts begin to separate when piston on compression stroke is $1\frac{1}{2}$ inches from top dead center, spark control lever and breaker assembly in the fully advanced position.

FIRING ORDER.—The firing order is 1R, 4L, 3R, 2L, 4R, 1L, 2R, 3L.

SPARK PLUG GAPS.—Spark plug gaps are .030 inch.

STARTER.—Model No. 72. Starter is connected to the engine through a Bendix drive. Lock torque is 17.5 pound-feet at 3.5-3.8 volts. Running freely, starter current is 40 amperes.

OILING.—Starter bearings are of the oilless type.

GENERATOR.—Model No. 153. Generator current regulation is by third brush system. Generator begins to supply current at 7 miles per hour or 500 R.P.M. of armature and reaches its maximum current output of 14-16 amperes at 18-25 miles per hour or 1400 R.P.M. of armature.

Amperes	Generator Data	R.P.M.
Neutral		500
10-12		900
14-16		1400
11-13		2000

To increase the charging rate loosen the two screws holding third brush arm, and move third brush in a counter-clockwise direction (looking at commutator end). To decrease charging rate, move third brush in a clockwise direction. Brush must be re-seated after adjusting position.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—There is no relay. The circuit between the generator and battery is controlled by the ignition switch.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dimmer lamps are 6-8 volt, 5 cp. Dash and tail lamps are each 6-8 volt, 4 cp. Dome lamp is 6-8 volt, 4 cp. Corner lamps are 6-8 volt, 2 cp.

CIRCUIT BREAKER.—A vibrating circuit breaker takes the place of fuses. It requires 25 amperes to start this device vibrating. While vibrating, the current is 3-5 amperes.

COMBINATION SWITCH.—Model N . 1154.

Plate No. 545

EL CAR

MODELS D-4, H-4, G-4, AND K-4, (1920-21). DELCO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

BATTERY.—Willard, Type SJRG-3, 6 volt, 90 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 2159. Distributor Model No. 5214. Breaker contacts separate .020 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING.—Put 8 or 10 drops of light engine oil in the oiler at the side of the distributor head every two weeks. Put a small amount of vaseline on the cam, applying with a toothpick. If the track of the rotor button is not well polished, apply a small amount of vaseline with a soft cloth. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when the top dead center mark on the fly-wheel is $1\frac{3}{8}$ inches past the indicator, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 3, 4, 2.

SPARK PLUG GAPS:—Spark plug diameters are $\frac{7}{8}$ inch. Gaps are .030 inch.

STARTER.—Model No. 177. Starter is connected to the engine through a Bendix drive.

Oiling.—Put 5 or 6 drops of light engine oil in each of the starter oilers every month. Remove the plug in the reduction gear case and inject soft cup grease every six months.

GENERATOR.—Model No. 176. Rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. Maximum charging rate is 11-15 amperes, reached at 1200 R.P.M. of the armature or 16-20 miles per hour.

Amperes	Generator Data	R.P.M.
Neutral		550
4		800
8		1000
11-15		1200
11-14		2000

Charging rate is varied by the adjustment of the third brush setting. To move the third brush, loosen the three screws holding the bearing retainer plate on the commutator end and shift the plate. Move in a counter-clockwise direction to increase the charging rate, or in the opposite direction to decrease the charging rate. Tighten the adjusting screws and reseat the brush after making the adjustment. Maximum charging rate must not exceed 16 amperes.

OILING.—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted on the generator frame. Relay closes at 550-600 R.P.M. of the armature or 7-8 miles per hour, and opens at 500-550 R.P.M. of the armature or 5-6 miles per hour. Relay contacts separate .046 to .062 inch. Air gap between the relay armature and coil core is .020 to .035 inch, contacts closed. To adjust relay connect a voltmeter between the positive (+) generator brush and ground. Then slowly speed up the generator and adjust the relay spring tension by turning the thumb nut until the contacts close when the voltmeter indicates 7.5 volts. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dimmer lamps are 6-8 volt, 4 cp. Tail lamp is 6-8 volt, 3 cp. Dash lamp is 6-8 volt, 2 cp.

CIRCUIT BREAKER.—A vibrating circuit breaker takes the place of fuses. It requires 25 amperes to start the vibrator. While vibrating the current is 3-5 amperes.

MODELS 19 AND 14 (1922)

BOSCH GENERATING, STARTING AND LIGHTING SYSTEM CONNECTICUT IGNITION

BATTERY.—U. S. L., Type HDN-311-X, 6 volt, 94 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Coil Model No. 225-Y. Distributor Model No. 15-T. Breaker contacts separate .025 inch. They are made of tungsten. When the condition of the points affects the ignition, renew the inner breaker mechanism. For temporary service, resurface contacts with fine emery cloth.

Oiling.—Refill the cup under the breaker head with pure vaseline, and turn down every month. If the car is driven more than 1000 miles in a month, this must be done every 1000 miles.

Timing.—Breaker contacts begin to separate when top dead center mark on flywheel is 1 inch past indicator, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plug Gaps.—The spark plug gaps are .030 inch.

STARTER.—Type No. 525. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter cranks the engine at 100-125 R.P.M., taking 110-160 amperes.

Starter Test Data.—No. 525

Torque	R.P.M.	Amperes
2 lb. ft.	1600	130
6 lb. ft.	600	280
10 lb. ft.	250	410
12 lb. ft.	125	465
15 lb. ft.	Lock	540

The brush tension is 2 pounds.

Oiling.—Oilless bearings are used. No oiling is required.

GENERATOR.—Type No. 636. The direction of rotation is counter-clockwise, viewed from the commutator end. Generator current regulation is by the third brush system. Maximum charging rate is 15 amperes, reached at 1800 R.P.M. of armature, or 20 miles per hour.

Generator Test Data.—No. 636

Hot Test		Cold Test	
Amperes	R.P.M.	Amperes	R.P.M.
0	550	0	500
4	780	4	650
8	1200	12	1150
10	1800	15	1800
8	2300	12	2500

The brush tension on all brushes is 1 3/4 pounds.

Oiling.—Put 4 or 5 drops of oil in the generator oilers each 500 miles. If the car is driven less than 500 miles in two weeks, the oiling should be done every two weeks.

RELAY.—The relay closes when the voltage of the generator reaches 6.5 to 7.5 volts, and opens when there is 0 to 2 amperes discharge. The relay contacts separate .013 to .018 inch. The air gap between the coil core and the relay armature is .031 inch, contacts separated. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 16 cp. Tonneau lamp is 6-8 volt, 4 cp. Dash and tail lamps are each 6-8 volt, 2 cp.

FUSES.—Generator fuse is 5 ampere. Lighting fuses are 10 ampere.

GARDNER
Model T (1922)
Westinghouse System

Plate No. 548

GARDNER

MODEL T (1922)

WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM WESTINGHOUSE IGNITION

BATTERY.—Willard, Type SJRN-3, 6 volt, 94 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Type S.C. Coil Model No. 288,761. Distributor Model No. 290,356. Breaker contacts separate .012 to .016 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oilstone. The bumper on the contact spring is $\frac{1}{8}$ inch off center from the line through the centers of the shaft and terminal screw, this offset being opposite to the direction of rotation of the cam. The above adjustment is made by bending the solid arm at the terminal block. A pull of 20 to 25 ounces, applied to the movable contact, is required to separate the contacts .020 inch. The spring pressure is adjusted by bending the solid arm at the point of contact with the contact spring. Resistance of the primary winding of the ignition coil is 1 ohm. Resistance of the secondary winding is 3700-4700 ohms.

Oiling.—Put 4 or 5 drops of light engine oil in the oiler at the side of the breaker box every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Timing.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plug Gaps.—Spark plug gaps are .025 inch.

STARTER.—Frame No. 33AB. Style 265,774-C. Rotation is counter-clockwise, looking at commutator end. Starter is connected to the engine through a Bendix drive.

The brush tension is 2 to 3 pounds.

Starter Test Data.—No. 33AB

Torque	R.P.M.	Volts	Amperes
0.00 lb. ft.	3700-4100	5.5	70
1.75 lb. ft.	1600	5.5	150
12.00 lb. ft.	Lock	3.7	500

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator oilers every month.

GENERATOR.—Frame No. 150. Style No. 271,528-B. Rotation is counter-clockwise, looking at commutator end. Generator current regulation is by the third brush system. Maximum current output is 15-16 amperes at 7.5 volts, reached at 1450-1750 R.P.M. of the armature or 15-20 miles per hour.

Generator Data

Amperes	R.P.M.	Volts
0	575	6.5
8.5-10.5	1000	7-7.5
15.0-16.0	1450-1750	7.5

Shunt field winding takes 3.25 to 4 amperes at 6 to 6.3 volts. Move the third brush in a counter-clockwise direction to increase the charging rate, and in a clockwise direction to decrease the charging rate.

Oiling.—Put 5 or 6 drops of light engine oil in the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted in the generator frame. Relay closes at 7 miles per hour or 575-600 R.P.M. of the armature, and opens at 5 miles per hour or 525-575 R.P.M. of the armature. Adjust the spring tension on the relay armature so that the contacts open with a discharge current of 0-3 amperes. Adjust the air gap between the relay armature and coil core so that the contacts close when the voltage of the generator reaches 6.2 to 6.5 volts. Air gap between relay armature and coil core is .005 inch, contacts closed. Contacts separate .030 to .035 inch. Resistance of the shunt coil is 68 ohms. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dimmer, dash and tail lamps are 6-8 volt, 2 cp.

FUSES.—Generator fuse is 5 ampere. Lighting circuit fuses are 20 ampere.

ESSEX 1921 AND 1922 DELCO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

BATTERY:—(1921) Exide, Type XC-15-1, 6 volt 105 ampere hour (1922) Exide Type XC-13-1, 6 volt, 90 ampere hour. The negative (—) terminal is grounded.

IGNITION:—Coil Model No. 2127. Distributor Model No. 5222. Breaker contacts separate .020 to .0275 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING:—Put 2 or 3 drops of light engine oil in the upper ball bearing of the distributor shaft every two weeks. If the track of the rotor button in the distributor shaft is not well polished, apply a small amount of vaseline with a soft cloth. Clean out and repack the distributor housing with soft cup grease every six months.

TIMING:—Breaker contacts begin to separate when the flywheel marking "DC 1 & 4" is at the indicator, spark control lever and breaker assembly in the fully advanced position.

FIRING ORDER:—The firing order is 1, 3, 4, 2.

SPARK PLUG GAPS:—Spark plug gaps are .030 inch.

STARTER:—Model No. 161. Starter is connected to the engine through a set of reduction gears. The raising and lowering of the two grounded starter brushes serves as a starting switch. Starter cranks the engine at 120 R.P.M., taking 150 amperes. Lock torque is 10.4 pound-feet, current being 780 amperes at 2.86 volts.

OILING:—Put 4 or 5 drops of light engine oil in the oiler at the commutator end and 8 to 10 drops in the oiler at the opposite end every two weeks.

GENERATOR:—Model No. 166. Generator current regulation is by third brush system. Maximum current output is 12-16 amperes, reached at 20 miles per hour or 1400 R.P.M. of the armature. Generator begins to supply current at 7 miles per hour.

Amperes	Generator Data	R.P.M.
2		600
12-16		1400
12-16		1600
8		2400

Charging rate is varied by adjusting the third brush setting. To move the third brush, loosen the three screws which hold the bearing retainer plate in place on the commutator end. Move the third brush holder in a counter-clockwise direction (looking at the commutator end) to increase the charging rate, and in a clockwise direction to decrease the charging rate. Tighten the holding screws and reseal the brush after adjusting position.

OILING:—Put 4 or 5 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY:—There is no relay. The circuit between the generator and the battery is controlled by the ignition switch.

LAMPS:—Head lamps are 6-8 volt, 21 cp. Dash and tail lamps are 6-8 volt, 2 cp. On 1921 cars, head lamps are 6-8 volt, 15 cp.

CIRCUIT-BREAKER:—A vibrating circuit-breaker takes the place of fuses. It requires a current of 25 amperes to start the vibrator, but 3-5 amperes will cause it to continue.

MODEL V, SERIES 5 (1921)

MODEL V-4-2 SERIES (1922)

DELCO GENERATING, STARTING AND LIGHTING SYSTEM

DELCO IGNITION

BATTERY.—Willard, SJRN-5, 6 volt, 120 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 2162. Distributor Model No. 5178. Breaker contacts separate .018 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING.—Put 5 or 6 drops of light engine oil in the ignition unit oiler every two weeks. If the track of the rotor button in the distributor head is not well polished, apply a small amount of vaseline with a soft cloth. Once each year remove the grease plug on the side of the distributor housing and repack the housing with medium heavy cup grease.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever two inches from the lowest position in the sector. (First see that breaker assembly is fully retarded when the control lever is in the fully retarded position.)

FIRING ORDER.—The firing order is 1R, 4L, 3R, 2L, 4R, 1L, 2R, 3L.

Spark Plugs.—Spark plug gaps are $\frac{7}{8}$ inch. Gaps are .030 inch.

STARTER.—Model No. X-9821. Starter is connected to the engine through a Bendix drive. Lock torque is 14 pound-feet. Starting switch is of the magnetic type, operated by a push button on the dash.

OILING.—Put 8 or 10 drops of light engine oil in each of the starter bearing oilers every 1000 miles or each month.

GENERATOR.—Model No. X-9784. Generator current regulation is by the third brush system. Maximum current output is 18 amperes, reached at 24 miles per hour or 1000 R.P.M. of the armature. Charging rate decreases to 10 amperes at 2000 R.P.M. of the armature or 48 miles per hour. To vary the charging rate first loosen the clamp nut on the front end of the generator one or two turns. Then turn the third brush adjusting screw in a clockwise direction to increase the charging rate and in a counter-clockwise direction to decrease the charging rate. Tighten the clamp nut and reseal the brush after adjusting position.

OILING.—Put 5 or 6 drops of light engine oil in the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 10 miles per hour or 400 R.P.M. of the armature, and opens at 8 miles per hour or 320 R.P.M. of the armature. Relay contacts separate .046 to .062 inch. Air gap between relay armature (moving member) and coil core is .020 to .035 inch, contacts closed. To adjust relay, connect a voltmeter between the positive (+) generator brush and ground. Then slowly speed up the generator and adjust the relay spring tension until the relay contacts close when the voltage of the generator reaches 7.5 volts. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp.

CIRCUIT BREAKER.—A vibrating circuit breaker takes the place of fuses. It requires 25 amperes to start the vibrator. While vibrating the current is 3-5 amperes.

BATTERY:—Prest-O-Lite (1920-21) 6 volt, 80 ampere hour (1922) Type 613 RHN, 6 volt, 100 ampere hour. The negative (—) terminal is grounded..

IGNITION.—Coil Model No. 2159. Distributor Model No. 5207. Breaker contacts separate .018 inch. They are made of platinum. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oilstone.

OILING.—Put 3 or 4 drops of light engine oil in the ignition unit oilers every two weeks. If the track of the rotor button in the distributor head is not well polished, apply a small amount of vaseline with a soft cloth. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when the top dead center mark on the flywheel is $1\frac{3}{8}$ inches past the indicator, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .030 inch.

STARTER.—Model No. 164 or 181. Starter is connected to the engine through a Bendix drive. The direction of rotation is clockwise, looking at the commutator end. Running free the starter takes 36 amperes at 6 volts. Lock torque is 27 lb. ft. at 2.75 volts. The brush tension should be $2\frac{1}{4}$ to $2\frac{3}{4}$ pounds on each brush.

Oiling.—Put 8 or 10 drops of light engine oil in each of the starter oilers every month or each 1000 miles. Remove the grease plug and refill the reduction gear housing with medium soft cup grease every six months. Saturate the wick in the oiler on the end of the Bendix gear with light engine oil once a year.

GENERATOR.—Model No. 165. Rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. Maximum charging rate is 11-15 amperes, reached at 1200 R.P.M. of the armature, or 16-20 miles per hour.

Amperes	Generator Data	R.P.M.
Neutral		550
4		800
8		1000
11-15		1200
11-14		2000

Charging rate is varied by adjustment of the third brush setting. To move the third brush, loosen the three screws holding the bearing retainer plate on the commutator end and shift the plate. Move in a counter-clockwise direction to increase the charging rate, or in the opposite direction to decrease the charging rate. Tighten the adjusting screws and reseat the brush after making the adjustment. Maximum charging rate must not exceed 16 amperes.

OILING.—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted on the generator frame. Relay closes at 550-600 R.P.M. of the armature or 7-8 miles per hour, and opens at 500-550 R.P.M. of the armature or 5-6 miles per hour. Relay contacts separate .046 to .062 inch. Air gap between relay armature and coil core is .020 to .035 inch, contacts closed. To adjust relay, connect a voltmeter between the positive (+) generator brush and the ground. Then slowly speed up the generator and adjust the relay spring tension by turning the thumb nut, until the contacts close when the voltmeter indicates 7.5 volts. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp. On 1920 and 1921 cars head lamps are 6-8 volt 15 cp. On 1920 cars, dimmer bulbs connected to No. 4 terminal were used instead of a dimming resistance.

CIRCUIT BREAKER.—A vibrating circuit breaker takes the place of fuses. It requires 25 amperes to start the vibrator, but 3.5 amperes will cause it to continue.

Delco. Motor and Generator
Plate No. 552

DAVIS

MODELS 51 TO 57 (1921) AND 61 TO 67 (1922) DELCO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

BATTERY:—(1922) Prest-O-Lite, (1921) Willard Type SJWN-3. 6 volt 80 ampere hour. The negative (—) terminal is grounded.

IGNITION:—Coil Model No. 2159. Distributor Model No. 5207. Breaker contacts separate .018 inch. They are made of platinum. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oilstone.

Oiling:—Put 3 or 4 drops of light engine oil in the ignition unit oilers every two weeks. If the track of the rotor button in the distributor head is not well polished, apply a small amount of vaseline with a soft cloth. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

Timing:—Breaker contacts begin to separate when the top dead center mark on the fly-wheel is $1\frac{3}{8}$ inches past the indicator, spark control lever and breaker assembly in the fully retarded position.

Firing Order:—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps:—Spark plug gaps are .030 inch.

STARTER:—Models 164 and 181. Starter is connected to the engine through a Bendix drive. Lock torque is 28 pound-feet at 4 volts, the current being 525 amperes.

Oiling:—Put 4 or 5 drops of light engine oil in the starter oilers every month. Remove the grease plug and inject soft cup grease every six months.

GENERATOR:—Model No. 165. Rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. Maximum charging rate is 11-15 amperes, reached at 1200 R.P.M. of the armature, or 16-20 miles per hour.

Generator Data

Amperes	R.P.M.
Neutral	500
4	800
8	1000
11-15	1200
11-14	2000

Charging rate is varied by adjustment of the third brush setting. To move the third brush, loosen the three screws holding the bearing retainer plate on the commutator end and shift the plate. Move in a counter-clockwise direction to increase the charging rate, or in the opposite direction to decrease the charging rate. Tighten the adjusting screws and reseal the brush after making the adjustment. Maximum charging rate must not exceed 16 amperes.

Oiling:—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY:—Relay is mounted on the generator frame. Relay closes at 550-600 R.P.M. of the armature or 7-8 miles per hour, and opens at 500-550 R. P. M. of the armature or 5-6 miles per hour. Relay contacts separate .046 to .062 inch. Air gap between relay armature and coil core is .020 to .035 inch, contacts closed. To adjust relay, connect a voltmeter between the positive (+) generator brush and the ground. Then slowly speed up the generator and adjust the relay spring tension by turning the thumb nut, until the contacts close when the voltmeter indicates 7.5 volts. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS:—Head lamps are 6-8 volt, 24 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp. On the models 51 to 57, head lamps are 6-8 volt, 24 cp.

CIRCUIT BREAKER:—A vibrating circuit breaker takes the place of fuses. It requires 25 amperes to start the vibrator, but 3.5 amperes will cause it to continue.

Plate No. 553

COMET

MODEL C-53 (1919-20-21-22)

WAGNER GENERATING, STARTING AND LIGHTING SYSTEM

WAGNER IGNITION

BATTERY:—Willard, SJRN-4, 6 volt, 100 ampere hour. The positive (+) terminal was grounded in 1919. In 1920,21 and 22 the negative (—) terminal was grounded.

IGNITION:—Breaker contacts separate .018 to .026 inch. When the condition of the points affects the ignition, renew the breaker lever and contact screw.

OILING:—Screw up the grease cup under the breaker head one-half turn every two weeks. If car is driven more than 500 miles in two weeks, this must be done every 500 miles. Put 3 or 4 drops of light engine oil on the wick in breaker lever spindle, every six months.

TIMING:—Breaker contacts begin to separate when the dead center mark on flywheel is $\frac{1}{2}$ inch past the indicator, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER:—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS:—Spark plug gaps are .025 to .030 inch.

STARTER:—(1919-20) Model EM-291, Type 36T (1921-22) Model EM-348, Type 46-2-T. The starter is connected to the engine by a Bendix drive.

OILING:—Put 5 or 6 drops of light engine oil in each of starter oilers every month.

GENERATOR:—Model E.M.-276, Type 45-W. Generator current regulation is by third brush system. Rotation is counter-clockwise, viewed from the commutator end. Maximum current output of 18 amperes is reached at 1500 R.P.M. of armature, or 21 miles per hour.

Amperes	Generator Data	R.P.M.
7.0		700
13.0		1000
16.0		1300
18.0		1500
14.0		2000
10.5		2500

OILING:—Put 5 or 6 drops of light engine oil in each of generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY:—Relay closes at 8-10 miles per hour and opens at 6-8 miles per hour. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS:—Head lamps are 6-8 volt, 18 cp. Dimmer lamp is 6-8 volt, 4 cp. Dash lamp is 6-8 volt, 4 cp. Tail lamp is 6-8 volt, 2 cp.

AUBURN MODEL 6-51 (1922) REMY GENERATING, STARTING AND LIGHTING SYSTEM REMY IGNITION

BATTERY.—Exide, Type 3-XC-15-1, 6 volt, 100 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Coil Model No. 284-B. Distributor Model No. 366-D. Breaker contacts separate .020 to .025 inch. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

Oiling.—Refill the grease cup under the distributor head with soft cup grease and turn down two turns every two weeks. Put a small amount of vaseline on the fiber bumper of the contact arm, applying with a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

Timing.—Breaker contacts begin to separate when the piston entering power stroke is position.

on top dead center, spark control lever and breaker assembly in the fully retarded

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—Spark plug gaps are .030 inch.

STARTER.—Model 705-A. Direction of rotation looking at commutator end is clockwise. Starter is connected to the engine through a Bendix drive. Starter cranks the engine at 105 R.P.M. Brush tension is 16 to 20 ounces.

Starter Data

Torque	R.P.M.	Amperes	Volts
4 lb. ft.	1000	175	5.1
8 lb. ft.	625	280	4.6
12 lb. ft.	350	365	4.3
16 lb. ft.	225	450	3.9
20 lb. ft.	100	510	3.6
24 lb. ft.	Lock	580	3.3

Oiling.—Put 4 or 5 drops of light engine oil in each of the starter oilers about every 2500 miles.

GENERATOR.—Model No. 913-F. Direction of rotation looking at commutator end is counter-clockwise. Generator current regulation is by third brush system. A thermostat, located in the brush rigging of the generator, cuts a resistance into the shunt field circuit at a temperature of 175° F., reducing the maximum charging rate 9 amperes. The thermostat is intended to regulate the charging rate as demands of the seasons or car operations requires. Never touch the thermostat points. Maximum current output is 21 amperes, reached at 1800 R.P.M. of the armature or 25 miles per hour.

Hot Test Generator Data.—913 F. Cold Test

Hot Test	Generator Data.—913 F.	Cold Test
7.0	1100	7.1
10.0	1800	7.5
9.0	2500	7.4
		18.5 Max.
		825
		1800
		2500
		7.1
		8.5
		8.4

The tension of all the brushes is 14 to 18 ounces. Charging rate is varied by adjusting third brush setting. Third brush is moved by turning a small screw exposed in the commutator end plate. Move the third brush in the direction of armature rotation to increase the charging rate and in the opposite direction to decrease the charging rate. Reseat the brush after adjusting position.

Oiling.—Put 4 or 5 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Model No. 264-B. The relay closes at 675 R.P.M. of armature and opens at 625 R.P.M. The contacts separate .012 to .015 inch and the air gap between the coil core and the relay armature is .012 to .015 inch, contacts closed. Clean the contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 20 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp.

Plate No. 555

LAMPS.—Head lamps are 6-8 volt, 17 cp. Dimmer lamps are 6-8 volt, 5 cp. Dash and tail lamps are 6-8 volt, 2 cp.

Plate No. 556

BEGGS

MODEL 20 (1920-21)

AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM CONNECTICUT IGNITION

BATTERY:—Exide, Type 3-XC-13-1. 6 volt, 90 ampere hour. The starting capacity is 98 amperes for 20 minutes. The lighting capacity is 5 amperes for 16.8 hours. The negative (—) terminal is grounded.

IGNITION:—Breaker contacts separate .023 inch. They are made of tungsten. When the condition of the contacts affects the ignition, renew the inner breaker mechanism. For temporary service, resurface with fine emery cloth.

OILING:—Refill the cup under the breaker head with pure vaseline and turn down every month. If the car is driven more than 1000 miles in a month, this must be done every 1000 miles.

TIMING:—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER:—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS:—Spark plug gaps are .030 inch.

STARTER:—Model MH-1025. Starter is connected to the engine by means of a Bendix drive. The direction of rotation is counter clockwise, looking at the commutator end.

Starter Data			
Torque	R.P.M.	Volts	Amperes
0 lb. ft.	4000	6.	40-60
1.3 "	1500	5.5	100
5 "	800	5.	200
9 "	400	4.5	300
17.5 "	Lock	4.	600

OILING:—Put 5 or 6 drops of light engine oil in each of the starter oilers every month.

GENERATOR:—Model GJ. Generator current regulation is by the third brush system.

Generator Data.

Cold Test. (25°C)			Hot Test (75°C)		
Amperes.	Volts.	R.P.M.	Amperes.	Volts.	R.P.M.
2	6.25	575	2	6.95	700
6	6.4	700	6	7.1	875
10	6.55	900	10	7.25	1200
14	6.7	1250	12	7.35	1650
15.5	6.8	1700	12	7.35	1850

Maximum charging rate is reached at 20-25 miles per hour or 1600-1700 R.P.M. of the armature.

OILING:—Put 4 or 5 drops of light engine oil in each of generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY:—Relay closes at 6-9 miles per hour or 550-600 R.P.M. of the armature and opens at 4-7 miles per hour or 500-550 R.P.M. of the armature. Charging current is 1-3 amperes at closing, and discharge current .5 to 1.5 amperes at opening of relay contacts. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove allgrit. Adjust before again putting into service.

LAMPS:—Head lamps are 6-8 volt, 21 cp. Dash and tail lamps are 3-4 volt, 2 cp.

CADILLAC

MODEL 61 (1922)

DELCO GENERATING, STARTING AND LIGHTING SYSTEM

DELCO IGNITION

BATTERY.—Exide, Type 3-LXR-15-2, 6 volt, 130 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Ignition Coil Model No. 2115. Distributor Model N . 5239. Breaker contacts separate .020 inch for new cars; or for a new set of contact arms, and set contact gaps to .015-.018 inch for cars having been driven over 2000 miles on the set of contact arms. They are made of tungsten. If the condition affects ignition, remove and resurface on a medium hard oilstone.

Oiling.—Remove the breather pipe at the rear of the distributor housing and pack the gear compartment with soft cup grease every 2000 miles.

Timing.—Breaker contacts begin to separate when piston on compression stroke is $1 \frac{21}{32}$ inches in advance of top center, spark control lever and breaker assembly in the fully advanced position.

Firing Order.—The firing order is 1L, 2R, 3L, 1R, 4L, 3R, 2L, 4R.

Spark Plug Gaps.—Spark plug gaps are .023 inch.

STARTER-GENERATOR.—Model No. 98. The direction of rotation is counter-clockwise, viewed from the starter commutator end. The starter cranks the engine at 90-100 R.P.M., taking 140-150 amperes. The starter is connected to the engine through a set of reduction gears meshed by the operator. Lock torque is 6 lb. ft. at 3 volts. Running free the starter takes 70 amperes at 6 volts. The tension of the starter brushes should be $2 \frac{1}{4}$ to $2 \frac{3}{4}$ pounds each.

GENERATOR.—Generator current regulation is by the third brush system. The direction of rotation is clockwise, viewed from the generator commutator end.

Amperes	Generator Data.—M.G. 98	R.P.M.
0	_____	420
2	_____	500
15	_____	1000
17-19	_____	1500
13-17	_____	2000

To adjust the charging rate, loosen the generator cover band and the two screws holding the third brush mounting arm. Shift the third brush in the direction of armature rotation (clockwise) to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screws after making the adjustment. The field current is 2.5 amperes at 6 volts. The tension of each of the generator brushes should be $1 \frac{1}{4}$ - $1 \frac{3}{4}$ pounds.

Oiling: — Put 8 or 10 drops of light engine oil in each of the motor-generator oilers every two weeks or each 500 miles. Once each year remove and clean the motor and generator clutches and repack with vaseline.

RELAY.—There is no relay. The circuit between the generator and battery is controlled by the ignition switch.

LAMPS.—Head lamps are 6-8 volts, 21 cp. Dimmer and side lamps are 6-8 volts, 4 cp. Dash and tail lamps are in series and are 3-4 volts, 2 cp. Tonneau lamps are 6-8 volts, 2 cp.

CIRCUIT-BREAKER.—A vibrating circuit-breaker takes the place of fuses. It requires 25 amperes to start the vibrator but 10-15 amperes will cause it to continue. A lock-out circuit breaker protects the horn, backing lamp and signal lamp circuits. A current of 25-30 amperes causes it to open the circuit.

JORDAN

MODEL "F" (1920-21-22) SERIAL NOS. 5401 UP. DELCO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

BATTERY:—Willard (1920) Type SJW-4, 6 volt 118 ampere hour (1921-22) Type SJRN-4, 6 volt, 120 ampere hour. The negative (—) terminal is grounded.

IGNITION:—Coil Model No. 2159, Distributor Model No. 5215. Breaker contacts separate .020 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING:—Put 4 or 5 drops of light engine oil in each of the ignition unit oilers every two weeks. If the track of the rotor button in the distributor head is not well polished, apply a small amount of vaseline with a soft cloth. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING:—Breaker contacts begin to separate when the top dead center mark on the fly-wheel is $2\frac{1}{4}$ inches past the indicator, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER:—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS:—Spark plug gaps are .025 to .030 inch.

STARTER:—Model No. 179. Starter is connected to the engine through a Bendix drive. Starter cranks the engine at 125 R.P.M., taking 180 amperes. Lock torque is 7 pound-feet.

OILING:—Put 4 or 5 drops of light engine oil in the starter oilers every month.

GENERATOR:—Model No. 180. Rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. Maximum charging rate is 11-15 amperes, reached at 1200 R.P.M. of the armature or 16-20 miles per hour.

Amperes	Generator Data	R.P.M.
Neutral		550
4		800
8		1000
11-15		1200
11-14		2000

Charging rate is varied by the adjustment of the third brush setting. To move the third brush, loosen the three screws holding the bearing retainer plate on the commutator end and shift the plate. Move in a counter-clockwise direction to increase the charging rate, or in the opposite direction to decrease the charging rate. Tighten the adjusting screws and reseal the brush after making the adjustment. Maximum charging rate must not exceed 16 amperes.

OILING:—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY:—Relay is mounted on the generator frame. Relay closes at 550-600 R.P.M. of the armature or 7-8 miles per hour, and opens at 500-550 R.P.M. of the armature or 5-6 miles per hour. Relay contacts separate .046 to .062 inch. Air gap between the relay armature and coil core is .020 to .035 inch, contacts closed. To adjust relay connect a voltmeter between the positive (+) generator brush and ground. Then slowly speed up the generator and adjust the relay spring tension by turning the thumb nut until the contacts close when the voltmeter indicates 7.5 volts. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS:—Head lamps are 6-8 volt, 21 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp. On 1920 cars, head lamps are 6-8 volt, 18 cp. Dash and tail lamps are 6-8 volt 3 cp.

CIRCUIT BREAKER:—A vibrating circuit breaker takes the place of fuses. It requires 25 amperes to start the vibrator. While vibrating the current is 3-5 amperes.

LAFAYETTE

1922 MODEL DELCO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

BATTERY.—Exide, Type 3-LXRV-15-2, 6 volt, 130 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Coil Model No. 2115. Distributor Model No. 5221. Breaker contacts separate .018 inch. Both sets of contacts open at the same instant. They are made of tungsten. When the condition of the points affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

Oiling.—Put several drops of light engine oil in timer bearing every two weeks. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.

Timing.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever advanced one-third.

Firing Order.—The firing order is 1R, 4L, 3R, 2L, 4R, 1L, 2R, 3L.

Spark Plug Gaps.—Spark plug diameters are $\frac{7}{8}$ inch. Gaps are .025 inch.

STARTER-GENERATOR.—Model No. 187. Starter and generator are combined into one unit but are electrically separate. The starter is connected to the engine by a set of reduction gears and a pinion shifted by the operator. Two overrunning clutches are provided. Depressing the starting pedal opens the generator circuit, meshes the reduction gears and allows the motor brushes to come in contact with the commutator, closing the starter circuit and cranking the engine. When the pedal is released, a spring reverses these operations. Lock torque is 10 pound-feet at 3 volts. The motor running free takes 60 amperes at 6 volts. The brush tension of the motor brushes should be $2\frac{1}{4}$ to $2\frac{3}{4}$ pounds each.

GENERATOR.—Generator current regulation is by the third brush system. Thermostat opens at 195-200° F., cutting in a resistance, reducing the charging rate about 50 per cent. The maximum charging rate of 18 amperes is reached at 1400 R.P.M. of the armature or 35 M.P.H., car speed in high gear.

Amperes	Motor-Generator Data. No. 187	R.P.M.
Neutral		400
6		800
10-12		1000
18		1400

When generator is operating freely as a motor, with overrunning clutch as the only retarding force, the current is 5.5 amperes. To increase the charging rate, move the third brush in the direction of armature rotation. To decrease charging rate, move the third brush in the opposite direction. Reseat the brush after adjusting the position. The tension of the generator brushes should be $1\frac{1}{2}$ to $1\frac{3}{4}$ pounds each.

Oiling.—Put 4 or 5 drops of light engine oil in each of the starter-generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—There is no relay. The circuit between the generator and the battery is controlled by the ignition switch.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Side, dash and tail lamps are 6-8 volt, 2 cp.

CIRCUIT BREAKERS.—There is a vibrating breaker in the circuit to the head, side, dash and tail lamps, which takes the place of fuses. It requires a current of 25 amperes to start this device vibrating, but when vibrating a current of 3 to 5 amperes will cause it to continue. There is a lockout circuit breaker in the circuit to the horn, tonneau lamp and handy lamp socket. A current of 25 amperes will cause this device to open the circuit.

Plate No. 562

KLINE-KAR

MODEL 6-55, SERIES K AND KA (1920-21-22)

WAGNER GENERATING, STARTING AND LIGHTING SYSTEM CONNECTICUT IGNITION

BATTERY:—Prest-O-Lite (1920) 6 volt, 80 ampere hour (1921-22) Type 613 R H N, 6 volt 100 ampere hour. The positive (+) terminal is grounded.

IGNITION:—Coil Model M Distributor Model Nos. 16 & 18 Breaker contacts separate .016 to .020 inch. They are made of tungsten. When the condition of the contacts affects the ignition, renew the inner breaker mechanism. For temporary service, resurface contacts with fine emery cloth.

Oiling.—Refill the cup under the breaker head with pure vaseline and turn down every month. If the car is driven more than 1000 miles in a month, this must be done every 1000 miles. Do not put grease or oil in the cup.

Timing.—Breaker contacts begin to separate when piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plugs.—Diameter, $\frac{7}{8}$ inch. Spark gaps are .022 inch.

STARTER.—Model EM-320, 36-T. The direction of rotation is clock-wise, looking at the commutator end. Starter is connected to the engine through a Bendix drive. Starter cranks the engine at 100-125 R.P.M., taking 150-175 amperes. Lock torque is 11.5 pound-feet, current being 475 amperes. The brush tension is 1200 grams.

Oiling.—Put 5 or 6 drops of light engine oil in each of the starter oilers every month.

GENERATOR.—Model EM-305, 45-W. The direction of rotation is clockwise, looking at the commutator end. Generator current regulation is by the third brush system. Maximum current output is 16 amperes, reached at 1400 R.P.M. of the armature or 20-24 miles per hour. The tension of all of the brushes is 450 grams.

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Model No. K-44. Relay closes at 8-10 miles per hour or 600 R.P.M. of the armature and opens at 6-8 miles per hour or 500 R.P.M. of the armature. Charging current is 2 amperes at closing, and the discharge current 0-4 amperes at the opening of relay contacts. Contacts separate .035 to .065 inch. Air gap between relay armature and coil core is .025 inch, contacts closed. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 18 cp. Dash and tail lamps are 6-8 volt, 2 cp.

On the 1920 cars, head lamps are 6-8 volt, 15 cp.

FUSES.—Head-lamp fuse is 15 ampere. Horn fuse is 10 ampere. Spot, tail and dash-lamp fuses are 5 ampere.

LIBERTY

MODEL 10-B (1919) 10C (1920-21 AND 10-D (1922) WAGNER GENERATING, STARTING AND LIGHTING SYSTEM WAGNER IGNITION

Plate No. 563

BATTERY:—(1919-20-21) Willard, Type SJW-3, 6 volt, 90 ampere-hour (1922) Prest-O-Lite, Type 613 SHC, 6 volt, 115 ampere hour. The positive (+) terminal is grounded.

IGNITION:—Coil Model No. K-32. Distributor Model KC-335. Breaker contacts separate .024 to .029 inch. When the condition of the contacts affects the ignition, renew the lever arm and contact screw.

IGNITION:—Atwater Kent, Type C C used on 10-B cars. Breaker contacts separate .005 to .008 inch. Remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oilstone. Every two weeks remove distributor cap and put a few drops of oil in the oil hole exposed.

OILING:—Screw up the grease cup under the breaker head one-half turn every two weeks. If the car is driven more than 500 miles in two weeks, this must be done every 500 miles. Put 3 or 4 drops of light engine oil on the wick in the breaker lever spindle every 6 months.

TIMING:—Breaker contacts begin to separate when piston entering power stroke is on top dead center. spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER:—The firing order of the 10-B cars is 1, 5, 3, 6, 2, 4. That of the 10-C and 10-D cars is 1, 4, 2, 6, 3, 5.

SPARK PLUG GAPS:—Spark plug gaps are .025 inch.

STARTER:—Model E.M.-266, Type 36-T. Starter is connected to the engine through a Bendix drive. Starter cranks the engine at 115 R.P.M., current being 160 amperes. Lock torque is 11.5 pound-feet, current 475 amperes. Running freely, starter current is 60-90 amperes, armature revolving at 8000 R.P.M.

OILING:—Put 5 or 6 drops of light engine oil in each of the starter oilers every month.

GENERATOR:—Model E.M.-277, Type 45-W. Generator current regulation is by third brush system. Maximum current output is 15-17 amperes, reached at 20-23 miles per hour or 1600 R.P.M. of armature. Charging rate reduces to 8 amperes at 40 miles per hour or 3200 R.P.M.

OILING:—Put 5 or 6 drops of light engine oil in each generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY:—Model I-471. Relay closes at 8-10 miles per hour or 660-750 R.P.M. of the armature, and opens at 6-8 miles per hour or 450-660 R.P.M. of the armature. Charging current is 2 amperes at closing, and the discharge current is 0-4 amperes at opening of relay contacts. Contacts separate .035 to .065 inch. Air gap between relay armature (moving member) and coil core is .025 inch, contacts closed. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS:—Head lamps are 6-8 volt, 15 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and are each 6-8 volt, 2 cp. The 10-D cars use a dimmer resistance on the switch instead of dimmer bulbs. Head lamps are 6-8 volt, 21 cp.

Plate No. 564

PEERLESS

MODEL 56, SERIES 7 (1921-22) AUTO-LITE GENERATING, STARTING, AND LIGHTING SYSTEM ATWATER KENT IGNITION.

BATTERY:—Willard, (1921) Type SJRN-5 (1922) Type SJRG-5, 6 volt, 125 ampere hour. The negative (—) terminal is grounded.

IGNITION:—Type CA. Coil Model N-7. Breaker contacts separate .015 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

Oiling:—Put 4 or 5 drops of light engine oil in the ignition unit oilers every two weeks. Put a small amount of vaseline on the cam, applying with a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

Timing:—Breaker contacts begin to separate when the piston entering the power stroke is on top dead center, spark control one-half advanced.

Firing Order:—The firing order is 1R, 4L, 3R, 2L, 4R, 1L, 2R, 3L.

Spark Plug Gaps:—Spark plug gaps are .025 inch.

STARTER:—Model M.G. 1025. Starter is connected to the engine through a Bendix drive.

Starter Data		
Torque	R.P.M.	Amperes
2 lb. ft.	1280	135
4 lb. ft.	900	210
6 lb. ft.	600	275
8 lb. ft.	400	335
10 lb. ft.	180	390
13 lb. ft.	Lock	500

Oiling:—Put 4 or 5 drops of light engine oil in each of the starter bearing oilers every month.

GENERATOR:—Model GH 1025. Generator current regulation is by the third brush system.

Amperes	Generator Data. Model GH	R.P.M.
5		770-855
10		1075-1210
12		1285-1575
12-13		1575-1625

Brush pressure on commutator is 1 to 1 1/4 pounds.

Oiling:—Generator bearings are packed with soft cup or ball bearing grease, but should receive 2 or 3 drops of light engine oil every two weeks. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.

RELAY:—Relay closes at 8 miles per hour, or 570-600 R.P.M. of armature and opens at 6 miles per hour or 500-570 R.P.M. of armature. Charging current is .5 to 1.5 amperes at closing, and the discharge current 0 to 1 ampere at opening of relay. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS:—Head lamps are 6-8 volt, 21 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp. On enclosed models side lights replace the dimmer lights shown here. Side lights are 6-8 volt, 4 cp.

FUSES:—Fuses are 10 ampere.

MODEL 90 (1921-1922)

AUTOLITE GENERATING, STARTING AND LIGHTING SYSTEM

CONNECTICUT IGNITION WITH AUTOLITE COIL

BATTERY.—U. S. L., Type 313-C, 6 volt, 112 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Coil Model No. RG-101 (Autolite). Distributor Model 16-6 Cylinder. Breaker contacts separate .015 to .020 inch. When the condition of the contacts affects the ignition, renew the inner breaker mechanism. For temporary service, resurface with fine emery cloth.

Oiling.—Refill the cup under the breaker head with pure vaseline and turn down every month. If the car is driven more than 1000 miles in a month, this must be done every 1000 miles. Do not put grease or oil in the cup.

Timing.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 4, 2, 6, 3, 5.

Spark Plug Gaps.—Spark plug gaps are .025 to .030 inch.

STARTER.—Model No. M. G. 1020. Direction of rotation is clockwise, looking at the commutator end. Starter is connected to the engine through a Bendix drive. Starter cranks the engine at 165 R.P.M., taking 130 amperes.

Starter Data

Torque	R.P.M.	Volts	Amperes
1 lb. ft.	2200	5.5	100
3 lb. ft.	1250	5.1	185
5 lb. ft.	780	4.7	260
8 lb. ft.	110	4.2	365

Stalled Torque Data

Torque	Volts	Amperes
4.4 lb. ft.	2	240
11.8 lb. ft.	4	480
16.0 lb. ft.	5	600

The brush tension is 2 pounds.

Oiling.—Put 5 to 8 drops of light engine oil in the starter oilers every 1000 miles.

GENERATOR.—Model GJ-1020. Generator current regulation is by the third brush system. Maximum current output is 12-16 amperes, reached at 1700 R.P.M. of the armature or 22 miles per hour.

Generator Data

Amperes	Cold Test	R.P.M.	Amperes	Hot Test	R.P.M.
0	500		0	460	
8	750		6	840	
12	960		9	1050	
16	1400		12	1360	
16.5	1700		12.7	1700	
12	3400		10	3400	

The above readings are obtained with the generator charging a battery of 1.300 solution.

The tension of all the brushes is 1¼ pounds.

Oiling.—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Model C-13-1072. Relay closes at 7 miles per hour or 500 R.P.M. of the armature, and opens at 6 miles per hour or 450 R.P.M. of the armature. Relay contacts separate .020 inch. The air gap between the coil core and the relay armature is .010 to .025 inch, contacts closed. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sand paper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 15 cp. Side lamps are 6-8 volt, 2 cp. Dash, tail, tonneau and dimmer lamp are 6-8 volt, 2 cp.

FUSES.—Fuse is 20 ampere.

STEPHENS
Model 90 (1921-1922)
Auto-Lite Starter and Generator
Connecticut Ignition

Plate No. 565

LINCOLN MODEL 1921 AND 1922 DELCO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

LINCOLN
Model 1921 & 1922
Delco System

Plate No. 566

BATTERY.—Exide, Type 3, LRVX-15-2, 6 volt, 135 ampere-hours. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 2159. Distributor Model No. 5226. Breaker contacts separate to .020 inch. If burned or pitted, affecting the ignition, resurface on a medium hard oilstone.

Oiling.—Put 3 or 4 drops of oil in the oiler every 250 miles. Also put light cup grease to a level just above the cover plate near the spark advance lever on the forward side of the housing every 5000 miles. A very small amount of grease or vaseline should be applied to the surface of the breaker cam every 2000 miles.

Timing.—The right breaker points should commence to open on the mark "RET" on the clutch-ring. Spark control lever and breaker assembly fully retarded.

Firing Order.—The firing order is 1R, 4L, 2R, 3L, 4R, 1L, 3R, 2L.

Spark Plug Gaps.—Spark plug gaps are .025-.030 inch.

STARTER-GENERATOR.—Model No. 193. The starter and generator are combined into one unit. Starter is connected to the engine through a set of reduction gears, meshed by the operator. Two overrunning clutches are provided in connection with the ignition switch. A circuit is closed, allowing current to flow through the generator windings, causing the armature to revolve slowly, aiding the meshing of the reduction gears. One clutch permits this rotation, and also permits a relatively high speed of the armature, necessary when operating as a starter. The second overrunning clutch prevents the engine driving the armature through the reduction gears. Depressing the starter pedal meshes the reduction gears, opens the generator circuit and allows the motor brushes to come in contact with the commutator, closing the starter circuit and cranking the engine. When the pedal is released, a spring reverses the operations. The direction of rotation is counter-clockwise, looking at the starter commutator end. The starter running freely, takes 60 amperes at 6 volts. Lock torque is 10 lb. ft. at 3 volts. The pressure of the starter brushes should be 2 1/4-2 3/4 pounds each.

GENERATOR.—Generator current regulation is by the third brush. It begins to supply current at a speed of 7 miles per hour. The maximum charging rate is 16 amperes, reached at 1400 R.P.M. of armature, or 20 miles per hour.

Generator Data.—Motor Generator No. 193

Amperes	R.P.M.
3	600
12	1000
14-16	1400
15	2000

To adjust the charging rate, loosen the commutator cover band and the locknut on the end of the generator. Then turn the adjusting screw in a clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the locknut after making the adjustment.

Oiling.—Put a few drops of good oil in front and rear oil cups of the starter-generator bearings every 250 miles.

RELAY.—There is no relay. It is controlled by the ignition switch.

LAMPS.—Head lamps, 6-8 volt, 21 cp. Side, tonneau extension, dash, dome, rear quarter and inspection lamps, each 6-8 volt, 4 cp. Cowl and rear lamps, 3-4 volt, 2 cp. Handy extension lamp, 6-8 volts, 4 cp. Signal lamp, 6-8 volts, 21 cp. All lamps are single contact.

CIRCUIT BREAKER.—A circuit breaker mounted on the back of the switch takes the place of fuses. The vibrating circuit breaker in the lighting circuit begins to operate when the current flow reaches 25-30 amperes. While vibrating the current is not over 15 amperes. The lockout circuit breaker protects the horn and handy lamp circuits. A current of 25-30 amperes causes this device to operate. While operating the current flow is less than 1 ampere.

OAKLAND
Model 6-44 (1922)
Remy System

Plate No. 567

OAKLAND

REMY GENERATING, STARTING AND LIGHTING SYSTEM REMY IGNITION

BATTERY:—Prest-O-Lite, 6 volt, 100 ampere-hour. The negative (—) terminal is grounded.

IGNITION:—Coil Model No. 284-M. Distributor Model No. 606-D or 616-C. Breaker contacts separate .023 to .025 inch. When the condition of the contacts affect the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

Oiling:—Refill the grease cup under the distributor head with soft cup grease and turn down two turns every two weeks. Put a small amount of vaseline on the fiber bumper on the contact arm, applying with a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

Timing:—Breaker contacts begin to separate when the top dead center mark on the fly-wheel is $\frac{1}{2}$ inch past the indicator, spark control lever and breaker assembly in the fully retarded position.

Firing Order:—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plugs:—Diameter, $\frac{7}{8}$ inch. Spark gaps are .025 to .030 inch.

STARTER:—Model 701-A. Starter is connected to the engine through a Bendix drive.

Starter Data			
Torque	R.P.M.	Ampere	Volts
0 lb. ft.	10,000	65	5.7
2 lb. ft.	2250	175	5.1
6 lb. ft.	750	365	4.2
10 lb. ft.	225	500	3.5
12 lb. ft.	Lock	575	3.2

Above tests are made without gear reduction. Pressure of brushes on the commutator is 16 to 20 ounces.

Oiling:—Put 5 or 6 drops of light engine oil in each of the starter oilers every week or 500 miles.

GENERATOR:—Model No. 917-F. Generator current regulation is by the third brush system. A thermostat, located in the brush rigging of the generator, cuts a resistance into the shunt field circuit of the generator at a temperature of 175° F., reducing the maximum charging rate 8 amperes. Never touch the thermostat points. Maximum charging rate is 18 to 20 amperes, reached at 1900 R.P.M. of the armature.

Hot Test			Generator Data			Cold Test		
Ampere	Volts	R.P.M.	Ampere	Volts	R.P.M.	Ampere	Volts	R.P.M.
Cut in		820	Cut in		600			
7.0	7.20	1400	7	7.20	840			
10.0	7.50	2000	14	7.90	1170			
9.8	7.48	2200	18	8.35	1560			
8.8	7.39	2600	18	8.35	2180			

Charging rate is varied by adjustment of the third brush setting. Third brush assembly is moved by turning a screw exposed in the commutator end plate. Pressure of main brushes on the commutator is 17-20 ounces. Pressure of the third brush is 13-17 ounces.

Oiling:—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY:—Model No. 264-B. Relay closes at 8-10 miles per hour or 600-650 R.P.M. of the armature and opens at 6-8 miles per hour or 550-600 R.P.M. of the armature. Relay contacts separate .012 to .015 inch. The air gap between the relay armature and the coil core is .012 to .015 inch, contacts closed. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS:—Head lamps are 6-8 volt, 17 cp. Dash and tail lamps are 6-8 volt, 2 cp.

Plate No. 568

MAIBOHM

MODEL B (1920-21-22)

BLJR GENERATING, STARTING AND LIGHTING SYSTEM ATWATER KENT IGNITION

BATTERY.—Willard, SJWN-3, 6 volt, 90 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Type CC. Breaker contacts separate .006 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING.—Remove the distributor cap every two weeks, and put 4 or 5 drops of light engine oil in the oil hole exposed. Put a small amount of vaseline on the cam, applying with a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever $\frac{1}{2}$ inch from the fully retarded position. See that the breaker assembly is fully retarded when the spark control lever is in the fully retarded position.

FIRING ORDER.—The firing order is 1, 4, 2, 6, 3, 5.

SPARK PLUG GAPS.—Spark plug gaps are .025 inch.

STARTER.—Type FD-140, M-1308. Starter is connected to the engine through a Bijur automatic pinion shift. Starter cranks the engine at 140 R.P.M., taking 125 amperes. The lock torque is 11.6 pound-feet, current being 505 amperes at 4 volts. Running freely, starter armature revolves at 5600 R.P.M., with a current of 27 amperes. Pressure of brushes on commutator is 30 ounces.

OILING.—Put 5 or 6 drops of light engine oil in each of the starter oilers every month.

GENERATOR.—Type P-230, M-1371 or M-1442. Generator current regulation is by third brush system. Maximum current output is 12-14 amperes, reached at 1700 R.P.M. of the armature or 24 miles per hour. Charging rate is varied by adjusting third brush setting. Charging rate is varied by inserting a special toothed wrench in the adjusting hole in the commutator end plate, and moving the third brush through a ratchet engagement. Turn the wrench to the right to increase the charging rate and to the left to decrease the charging rate. Pressure of brushes on commutator is 32-36 ounces.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted on generator frame. Relay closes at 8-10 miles per hour or 600-650 R.P.M. of the armature, and opens at 6-8 miles per hour or 550-600 R.P.M. of the armature. Relay contacts separate .015 inch. Air gap between relay armature and coil core is .030 inch, contacts closed. Relay must be adjusted so that the contacts will close when the voltage of the generator reaches 6.5 volts, as indicated by a voltmeter connected across the main brushes. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 20 cp. Dash and tail lamps are each 6-8 volt, 2 cp.

FUSES.—Fuses are 20 ampere.

PACKARD SINGLE SIX
ATWATER KENT MOTOR AND GEN., DELCO IGNITION
Plate No. 569

PACKARD SINGLE SIX (1921-22)

ATWATER KENT GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

BATTERY.—Willard, Type SJRG, 6 volt, 111 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Coil Model No. 2150. Distributor Model No. 5228. Breaker contacts separate .015 to .020 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone. Both sets of contacts must separate at the same instant. Ignition consumes approximately 6 amperes of which is not indicated on ammeter.

Oiling.—Put 4 or 5 drops of light engine oil in the distributor oiler every month, or 1000 miles. Remove distributor head, wipe clean with cloth, apply small quantity of gun oil and wipe with a clean cloth, and apply a minute quantity of vaseline to the cam. This must be done every 2500 miles.

Timing.—Breaker contacts begin to separate when the marking on the flywheel, "Upper D.C. Cylinder 1 and 6," has 1½ inches to travel before reaching center line of motor, spark control lever and breaker assembly in fully advanced position.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—The spark plug gaps are .030 inch.

Fuelizer Plug Gap.—The fuelizer plug gap is ⅛ inch.

STARTER.—Form 6324. Starter is connected to the engine through a Bendix drive. Starter cranks the engine at 150 R.P.M., taking 175 amperes at 5 volts. Lock torque is 14 pound-feet, current being 500 amperes at 4 volts.

Oiling.—Put 5 or 6 drops of light engine oil in the two starter oilers each month. If the car is driven more than 1000 miles in a month, these attentions must be given every 1000 miles.

GENERATOR.—Form 5418. Generator current regulation is by the third brush system. Direction of rotation is counter-clockwise, looking at the commutator end. The maximum charging rate is 12-14 amperes, reached at approximately 20 miles per hour. To adjust charging rate, loosen stud which holds the third brush in place, and loosen screw on outside end of generator. Move third brush in a counter-clockwise direction, looking at the commutator end, to increase the charging rate, and in a clockwise direction to decrease the charging rate. Tighten both screws.

Oiling.—Put 5 or 6 drops of light engine oil in the generator oiler once each month. If the car is driven more than 1000 miles in a month, this oiling must be done every 1000 miles.

RELAY.—Relay is mounted on the generator frame. Relay closes at 8 to 10 miles per hour and opens at 6 to 8 miles per hour. Relay contacts separate .018 to .020 inch. The air gap between the coil core and the relay armature is .034 to .040 inch. Clean relay contacts by drawing unglazed paper between them. If badly worn or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 7 volt, 24 cp. Dimmer lamps are 7 volt, 6 cp. Dash and tail lamps are 7 volt, 2 cp. Dome lamps used on closed bodies are 7 volt, 8 cp. All are single contact.

CIRCUIT BREAKER.—A vibrating circuit breaker takes the place of fuses. It requires 25 amperes to start the vibrator, but 3-5 amperes will cause it to continue.

MODEL 34-B (1920-21-22)

DELCO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION BATTERY:—(1920-21) Willard Type SJRN-6, 6 volt, 162 ampere hour (1922) Prest-O-Lite, Type 617 SHC, 6 volt 170 ampere hour. The positive (+) terminal is grounded.

IGNITION.—Coil Model No. 135. Circuit Breaker Model No. 574. Distributor contacts separate .020-.0275 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth, and finish on a medium hard oilstone.

Oiling.—Put 4 or 5 drops of light engine oil in the oiler at the side of the distributor unit every two weeks. If the track of the rotor button is not well polished apply a small amount of vaseline with a soft cloth. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles. Pack the distributor housing with soft cup grease to the level of the distributor gears once each year.

Timing.—Breaker contacts begin to separate when the flywheel mark "1 & 6TC" is exactly opposite the indicator, spark control lever 4 to 5 inches advanced from the fully retarded position on the 1922 cars and in the fully retarded position on the 1920 and 1921 cars.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—Spark plug gaps are .022 to .027 inch.

STARTER.—Model No. 172. Starter is connected to the engine through a Bendix drive. Current during the cranking operation is 100 to 300 amperes. Pressure of brushes on the commutator is 2 1/4 pounds. Running free, the starter takes 50 amperes at 6 volts. Stall torque is 18 pound-feet, the current being 450 amperes at 4 volts. The direction of rotation is counter-clockwise, viewed from the commutator end.

Oiling.—Put 4 or 5 drops of light engine oil in each of the starter oilers every month.

GENERATOR.—Model No. 168. Generator current regulation is by third brush system. The direction of rotation is clockwise, viewed from the commutator end. The maximum charging rate is 14 to 16 amperes, reached at 1000 R. P. M.

Amperes	Hot Test	R.P.M.
0.0		285
9.5		500
14.0		1000
12.5		1400
10.0		2000

To vary the charging rate first loosen the clamp nut on the front end of the generator one or two turns. Then turn the third brush adjusting screw in a clockwise direction to increase the charging rate and in a counter-clockwise direction to decrease the charging rate. Tighten the clamp nut and reseal the brush after adjusting position. The tension of all the brushes is 1 to 1 1/2 pounds.

Oiling.—Put 4 or 5 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted on generator frame. Relay closes at 500 R.P.M. of armature or 8-9 miles per hour, and opens at 300 R.P.M. or 6-7 miles per hour. Relay contacts separate .046 to .062 inch. Air gap between relay armature (moving member) and coil core is .020 to .035 inch, contacts closed. To adjust relay, connect a voltmeter between the negative generator brush and ground. Then slowly speed up the generator and adjust the relay spring tension until the relay contacts close when the voltmeter indicates 7 1/2 volts. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper.

LAMPS.—Head lamps are 6-8 volts, 21 cp. Dimmer lamps are 6-8 volts, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp. Tonneau lamp is 6-8 volt, 4 cp. On the 1920, 1921 cars head lamps are 6-8 volt 30 cp.

CIRCUIT BREAKERS.—A vibrating circuit breaker takes the place of fuses in the head, dimmer, tail and dash lamp circuits. It requires a current of 25 amperes to start this device vibrating. While vibrating the current is 3-5 amperes. A locking circuit breaker takes the place of fuses in the horn, tonneau, and trouble lamp circuits. A current of 25 amperes will cause this device to open the circuit. The circuit breaker is model No. 5742.

BIJUR GENERATING, STARTING AND LIGHTING SYSTEM

REMY IGNITION

BATTERY.—U. S. L., Type HDN-311-X, 6 volt, 92 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Coil Model 284-B. Distributor Model No. H-366. The breaker contacts separate .010 inch. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or a piece of No. 00 sandpaper.

Oiling.—Put 2 or 3 drops of light neutral oil in the distributor oilers each month. If the car is driven more than 1000 miles in a month, this oiling must be done every 1000 miles.

Timing.—Breaker contacts begin to separate when the piston entering the power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 4, 2, 6, 3, 5.

Spark Plug Gaps.—The spark plug gaps are .032 inch.

STARTER.—Type FD-140. Starter is connected to the engine through a Bijur automatic pinion shift. Starter cranks the engine at 140 R.P.M., taking 125 amperes. The lock torque is 11.6 pound-feet, current being 500 amperes at 4 volts. Running freely, the starter armature revolves at 5600 R.P.M., with a current of 27 amperes. Brush pressure on the commutator is 30 ounces.

Oiling.—Put 5 or 6 drops of light engine oil in the starter oilers every month.

GENERATOR.—The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. Maximum charging rate is 12-15 amperes, reached at 1000 R.P.M. of the armature, or 18 miles per hour. The charging rate is varied by adjusting the third brush setting. This adjustment is made by inserting a special toothed wrench in the adjusting hole in the commutator end plate, and moving the third brush through a ratchet engagement. Turn the wrench to the right to increase the charging rate, and to the left to decrease the charging rate. The pressure of the brushes on the commutator is 32-36 ounces.

Oiling.—Put 5 or 6 drops of light engine oil in the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, this oiling must be done every 500 miles.

RELAY.—Relay is mounted on generator frame. Relay closes at 8-10 miles per hour or 600-650 R.P.M. of the armature, and opens at 6-8 miles per hour or 550-600 R.P.M. of the armature. Relay contacts separate .015 inch. Air gap between relay armature and coil core is .030 inch, contacts closed. Relay must be adjusted so that the contacts will close when the voltage of the generator reaches 6.5 volts, as indicated by a voltmeter connected across the main brushes. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 15 cp. Dimmer, dash and tail lamps are 6-8 volt, 2 cp.

FUSES.—The fuses are 20 ampere.

MITCHELL

MODELS F-40 (1920-21) AND F-50 (1922)

REMY GENERATING, STARTING AND LIGHTING SYSTEM

REMY IGNITION

BATTERY:—Willard (1920-21) 6 volt, 90 ampere hour. (1922) Type SJRN-4, 6 volt, 120 ampere hour. The positive (+) terminal is grounded.

IGNITION:—Coil Model No. 284-B. Distributor Model 366-A. Breaker contacts separate .022 inch. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING:—Refill the grease cup under the distributor head with soft cup grease and turn down two turns every two weeks. Put a small amount of vaseline on the fiber bumper of the contact arm, applying with a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING:—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER:—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS:—Spark plug gaps are .030 inch.

STARTER:—Model No. 700-C. Starter is connected to the engine through a Bendix drive.

Starter Data

Torque	R.P.M.	Amperes	Volts
0 lb. ft.	10,000	65	5.7
2 lb. ft.	2250	175	5.1
5 lb. ft.	750	365	4.2
10 lb. ft.	225	500	3.5
12 lb. ft.	Lock	575	3.2

Above tests are made without gear reduction. Pressure of brushes on the commutator is 20-24 ounces.

OILING:—Put 5 or 6 drops of light engine oil in each of the starter oilers every month.

GENERATOR:—Model 910-A. Generator current regulation is by the third brush system. A thermostat, located in the brush rigging of the generator, cuts a resistance into the shunt field circuit of the generator at a temperature of 175°F., reducing the maximum charging rate 8 amperes. Never touch the thermostat points. Maximum charging rate is 20 amperes with the thermostat closed, reached at 1800 R.P.M. of the armature or 25 miles per hour.

Generator Data

Cold Test. Thermostat Closed	Hot Test. Thermostat Open
Amperes	Amperes
0	0
5	4
10	6
15	8
20	11
14	9
R.P.M.	R.P.M.
600	800
750	1100
950	1250
1200	1450
1800	2000
3200	3200

Charging rate is varied by adjustment of the third brush setting. Third brush assembly is moved by turning a screw exposed in the commutator end plate. Pressure of main brushes on the commutator is 17-20 ounces. Pressure of the third brush is 13-17 ounces.

OILING:—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY:—Relay closes at 8-10 miles per hour or 600-650 R.P.M. of the armature and at rate .020 inch. Air gap between relay armature and coil core is .020 inch, contacts closed. Clean relay contacts by drawing unglazed paper between them. If badly opens at 6-8 miles per hour or 550-600 R.P.M. of the armature. Relay contacts seburned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS:—Head lamps are 6-8 volt, 21 cp. Dash and tail lamps are 6-8 volt, 2 cp.

On 1920-21 cars head lamps are 6-8 volt 15 cp.

FUSES:—The fuses are 10 ampere.

MODEL 6-D (1921-22)

DELCO GENERATING, STARTING AND LIGHTING SYSTEM

DELCO IGNITION

BATTERY.—Willard, Type SJRN-4, 120 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 2159. Breaker contacts separate .018 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or on the flat side of an emery wheel finishing on a hard oil stone.

Oiling.—Put 4 or 5 drops of light engine oil in the distributor shaft bearing every two weeks. If the track of the rotor button is not well polished, apply a small amount of vaseline with a soft cloth. If the car is driven more than 500 miles in two weeks these attentions must be given every 500 miles.

Timing.—Breaker contacts begin to separate when the top dead center mark on the flywheel is 1½ inches past the indicator, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—Spark plug diameters are 7/8 inch. Gaps should be .025-.028 inch.

STARTER.—Model No. 194. Starter is connected to the engine through a Bendix drive. Starter cranks the engine at 120 R.P.M., taking 75 to 175 amperes at 5 volts. The direction of rotation is counter-clockwise, looking at the commutator end.

Starter Data

Torque.	R. P. M.	Volts.	Amperes.
0	4500	5.5	40-50
16 lb. ft.	0	3.4	450

Oiling.—Self oiling graphite bushings are used.

GENERATOR.—Model No. 195. Generator current regulation is by the third brush system, direction of rotation being counter-clockwise, looking at commutator end. The maximum charging rate is 16 amperes, reached at 1200 R.P.M. of the armature or 17 miles per hour, car speed in high gear. Motoring freely, the generator takes 3-5 amperes at 6 volts. The field current is 2 amperes at 6 volts.

Generator Test Data.

Amperes.	Volts	R. P. M.
3	6.6	600
6	6.8	700
9	7.0	800
11.5	7.2	900
17.5	7.5	1400

To adjust the charging rate, loosen the three screws which hold the third brush mounting plate and shift the third brush. Shift the brush in the direction of generator rotation (counter-clockwise) to increase the charging rate and in the opposite direction to decrease the charging rate.

Oiling.—Put 4 or 5 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted on generator frame. Relay closes at 8-9 and opens at 5-7 miles per hour. Relay contacts separate .046 to .062 inch. Air gap between relay armature (moving member) and coil core is .020 to .035 inch, contacts closed. To adjust relay, connect a voltmeter between the positive generator brush and ground. Then slowly speed up the generator and adjust the relay spring tension by turning the thumb screw until the relay contacts close when the voltmeter indicates 7.5 volts.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dimmer and tail lamps are 6-8 volt, 1 cp. Dash, parking, quarter and door lamps are 6-8 volt, 2 cp. Spot light is 68 volt, 20 cp.

CIRCUIT BREAKER.—A vibrating circuit breaker takes the place of fuses. It requires a current of 25 amperes to start this device vibrating. While vibrating, the current is 3-5 amperes.

Plate No. 574

Note:—Cut of starter shown is Auto-Lite. For Wagner diagram see Page 562. On 1920 cars only one fuse is used and one connection from battery to switch. Dash lamp is grounded to relay.

SERVICE ENGINEERING COMPANY, SAN FRANCISCO—COPYRIGHTED, 1926

R. & V. KNIGHT

MODEL "J" (SIX CYLINDER) (1920-21-22)

MODEL "R" (FOUR CYLINDER) (1920-21-22)

WAGNER GENERATING AND LIGHTING SYSTEM

WAGNER IGNITION—WAGNER AND AUTO-LITE STARTER

BATTERY.—Willard, Type SJRN-4, 6 volt, 117 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Breaker contacts separate .020 to .025 inch. They are made of tungsten. When the condition of the contacts affects the ignition, renew the contact screw and lever arm.

Oiling.—Screw up the grease cup under the breaker head one-half turn every two weeks. If the car is driven more than 500 miles in two weeks, this must be done every 500 miles. Put 3 or 4 drops of light engine oil on the wick in the breaker lever spindle every six months.

Timing.—Breaker contacts begin to separate when the top dead center mark on the fly-wheel is $1\frac{1}{2}$ inches before the indicator, spark control lever and breaker assembly in the fully advanced position.

Firing Order.—The firing order is 1, 4, 2, 6, 3, 5, or 1, 3, 4, 2.

Spark Plug Gaps.—Spark plug gaps are .025 to .030 inch.

STARTER.—(J-1920-21-22 AND R. 1920) Wagner, Model EM-322, Type 46-T (R) (1921-22) Auto-Lite, Model ML-4001. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise looking at the commutator end. On Model "J" car, starter cranks the engine at 95 R.P.M. taking 180 amperes at 5.2 volts. On the Model "R" starter cranks the engine at 139 R.P.M. taking 175 amperes at 5.3 volts.

Starter Data (Auto-Lite, Model ML-4001.)

Running Torque	R.P.M.	Amperes
2 lb. ft.	1600	135
6 lb. ft.	950	260
10 lb. ft.	610	365
22 lb. ft.	Lock	4 volts.

Starter Data (Wagner, Model EM-322, Type 46-T)

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	1700		80-100
18 "	Lock	2.7	640

The brush tension on the commutator is 2 pounds.

Oiling.—Put 5 or 6 drops of light engine oil in each of the starter oilers every month.

GENERATOR.—Model EM-189, Type 45-W. Generator current regulation is by the third brush system. Maximum current output is 18 amperes, reached at 1500 R.P.M. of the armature or 20 miles per hour.

Hot Test		Generator Data		Cold Test	
Amperes	R.P.M.	Amperes	R.P.M.	Amperes	R.P.M.
2.25	740	0	500		
5.80	800	6	670		
11.20	1142	12	950		
12.00	1600	15	1180		
9.00	2100	16-18	1500		
7.50	2368	10	2500		

Shunt field winding takes 7 amperes at 4.5 volts. Move the third brush in the direction of armature rotation to increase the charging rate, and in the opposite direction to decrease the charging rate.

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 9-11 miles per hour or 500-550 R.P.M. of the armature and opens at 6-8 miles per hour or 450-500 R.P.M. of the armature. Relay contacts separate .030 inch. Air gap between relay armature and coil core is .015 inch.

LAMPS.—Head lamps are 6-8 volt, 15 cp. Dimmer lamps are 6-8 volt, 5 cp. Dash and tail lamps are 6-8 volt, 4 cp.

FUSES.—Fuses are 20 ampere.

IN PRINTING this edition of the Reed Service Manual many changes, additions and revisions were made in our endeavor to give you a complete and thorough Service Manual. These changes necessitated the elimination of obsolete cars as well as the combining of several duplicate pages.

So that all of our editions are uniform, and for the purpose of simplifying our records, we are herein purposely skipping the numbering of pages so that the page following is 751.

This does not affect the completeness of the Reed Service Manual in any manner.

Yours very truly,

SERVICE ENGINEERING COMPANY.

PIERCE-ARROW

SERIES 32 (1921-1922)

DELCO GENERATING, STARTING AND LIGHTING SYSTEM

DELCO IGNITION

BATTERY.—Willard, Type SJRN-6, 6 volt, 162.5 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Coils Model No. 2171. Distributor Model No. 5216. A dual battery ignition system is provided. Breaker contacts separate .020 to .027 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oilstone.

Oiling.—Put 5 or 6 drops of light engine oil in each of the distributor unit oilers every two weeks. If the rotor buttons and their tracks are not well polished apply a small amount of vaseline with a soft cloth. If the car is driven more than 1000 miles in a month, these attentions must be given every 1000 miles. Repack distributor driving gear compartment with soft cup grease every year.

Timing.—Breaker points begin to separate when the mark "Ignition" on the flywheel is $1\frac{3}{8}$ inches past top dead center, spark control lever and breaker assembly in a fully retarded position. Exhaust breaker opens 3° to 7° ahead of the intake breaker, measured on the flywheel.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—Spark plug gaps are .030 inch.

STARTER.—Model No. 191. Rotation, looking at the commutator end, is clockwise. Cranks the engine at 115 R.P.M., taking 180 amperes current. Running free the starter takes 42 to 52 amperes at 5000 R.P.M. Locked, the current is 450 amperes. The brush tension is $1\frac{1}{2}$ to 2 pounds.

Oiling.—Put 5 drops of light engine oil in the starter oiler every 500 miles.

GENERATOR.—Model No. 192. Rotation, looking at the commutator end, is counter-clockwise. Current regulation is by the third brush system, combined with a vibrating voltage regulator. The maximum charging rate is 20 amperes, reached at 1600 R.P.M. of armature, or 27 miles per hour, car in high gear. Tension of all brushes is 24 to 28 ounces.

Generator Test Data. No. 192

Hot Test		Cold Test	
Amperes	R.P.M.	Amperes	R.P.M.
2 Min.	600	5	600
8 Min.	800	10	800
16-18	1200	19-21	1200
16-18	1600	19-21	1600
17 Max.	2400	20 Max.	2400

Oiling.—Put 5 drops of light engine oil in each of the two generator oilers every 500 miles.

RELAY-REGULATOR.—Model No. 5513. The relay and regulator are combined into one unit, mounted on the forward side of the dash. The relay closes at 8 miles per hour, or 475 R.P.M. of armature, and opens at 6 miles per hour, or 425 R.P.M. of armature. The air gap between the coil core and the relay armature is .025 to .035 inch, contacts closed. Adjust the spring tension of the relay so that it closes at $6\frac{1}{4}$ to $6\frac{1}{2}$ volts. To adjust the voltage regulator (vibrator), disconnect the battery and connect a voltmeter between the generator main terminal and the frame. Vary the vibrator spring tension until the maximum voltage of the generator at any speed is $7\frac{3}{4}$ volts. Clean relay and regulator contacts by drawing unglazed paper between them. If badly burned or pitted resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 20 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 4 cp. Tail, dome, pillar and tonneau lamps are each 6-8 volt, 4 cp. All lamps have single contact base.

FUSES.—Main circuit fuse is 30 ampere. Lighting circuit fuses are 10 ampere.

Plate No. 751

Plate No. 752

REO

MODEL T-6. SERIES B (1922)

NORTH-EAST GENERATING, STARTING AND LIGHTING SYSTEM

NORTH-EAST IGNITION

BATTERY.—Willard, Type SJRN-4, 6 volt, 111 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Coil Type 10,481. Distributor Type No. 10,442. Breaker contacts separate .020 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

Oiling.—Put several drops of light engine oil in the oiler under the breaker head every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Timing.—Breaker contacts begin to separate when the flywheel marking "Spark 1 and 6" is in alignment with the upper edge of the right-hand engine support, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 4, 2, 6, 3, 5.

Spark Plug Gaps.—Spark plug gaps are .030 inch.

STARTER.—Model R, Type 3581-A. The direction of rotation is clockwise, viewed from the commutator end. Starter is connected to the engine through a chain and ratchet engagement on the universal shaft. Starter cranks the engine at 100 R.P.M. The lock torque is 65 pound-feet, the current being 450 amperes.

Oiling.—Put 4 or 5 drops of light engine oil in each of the starter oilers every month. Starter gear housing is packed with soft cup grease, which should be renewed every two years.

GENERATOR.—Model LR, Type 3819. The direction of rotation is clockwise, viewed from the commutator end. Generator current regulation is by the third brush system.

Generator Data.—LR

Hot Test		Cold Test

0.0	400	0.0	375
6	540	6	480
12	740	14	700
14.5	950	16.5	950
12	1300	14	1300

Charging rate is varied by adjustment of the third brush setting. Loosen the clamp screw above the bearing cup and turn adjusting screw in a clockwise direction (looking at the commutator end) to increase the charging rate, and in a counter-clockwise direction to decrease the charging rate. Lock third brush assembly by tightening the clamp screw. The brush tension of all brushes is 1 1/4 pounds.

Oiling.—Put 3 or 4 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Type 8212. Relay closes at 10-12 miles per hour or 500-550 R.P.M. of the armature, and opens at 8-10 miles per hour or 450-500 R.P.M. of the armature. Relay is adjusted to close when the voltage of the generator reaches 7 volts, and open with a discharge of 1 ampere. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Tonneau lamp is 6-8 volt, 5 cp. Dash, tail and parking lamps are 6-8 volt, 2 cp.

FUSES.—Generator fuse is 6 ampere. Lighting circuit fuses are 5 ampere.

Plate No. 753

WESTCOTT MODEL C-38 (1921-22) DELCO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

BATTERY:—Willard, (1921) Type SJW-4 (1922) Type SJWR-4, 6 volt, 117.5 ampere hour. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 2159. Distributor Model No. 5208. Breaker contacts separate .018 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING.—Put 4 or 5 drops of light engine oil in the distributor unit oilers every two weeks. If the track of the rotor button in the distributor head is not well polished, apply a small amount of vaseline with a soft cloth. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when the top dead center mark on the fly-wheel is $1\frac{3}{8}$ inches past the indicator, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .030 inch.

STARTER.—Model No. 181. Starter is connected to the engine through a set of reduction gears and a Bendix drive. Lock torque is 28 pound-feet at 4 volts, the current being 525 amperes. Starter running free takes 30 amperes at 6 volts. The brush tension should be from $2\frac{1}{4}$ to $2\frac{3}{4}$ pounds for each brush. The direction of rotation is clockwise, looking at the commutator end.

OILING.—Put 4 or 5 drops of light engine oil in each of the starter bearing oilers every month. Remove the grease plug in the reduction gear housing and inject soft cup grease every six months. Saturate the wick oiler in the end of the Bendix gear case with light engine oil every year.

GENERATOR.—Model No. 165. Rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. Maximum charging rate is 11-15 amperes, reached at 1200 R.P.M. if the armature or 16-20 miles per hour.

Amperes	Generator Data	R.P.M.
Neutral		550
4		800
8		1000
11-15		1200
11-14		2000

Charging rate is varied by the adjustment of the third brush setting. To move the third brush, loosen the three screws holding the bearing retainer plate on the commutator end and shift the plate. Move in a counter-clockwise direction to increase the charging rate, or in the opposite direction to decrease the charging rate. Tighten the adjusting screws and reseal the brush after making the adjustment. Maximum charging rate must not exceed 16 amperes.

OILING.—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted on the generator frame. Relay closes at 550-600 R.P.M. if the armature or 7-8 miles per hour, and opens at 500-550 R.P.M. of the armature or 5-6 miles per hour. Relay contacts separate .046 to .062 inch. Air gap between the relay armature and coil core is .020 to .035 inch, contacts closed. To adjust relay connect a voltmeter between the positive (+) generator brush and ground. Then slowly speed up the generator and adjust the relay spring tension by turning the thumb nut until the contacts close when the voltmeter indicates 7.5 volts. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 3-4 volt, 2 cp. Dome lamp is 6-8 volt 5 cp. On 1921 cars, head lamps are 6-8 volt, 18 cp. Dimmer lamps are 6-8 volt, 5 cp.

CIRCUIT BREAKER.—A vibrating circuit breaker takes the place of fuses. It requires 25 amperes to start the vibrator. While vibrating the current is 3-5 amperes.

Plate No. 754

WESTCOTT

MODEL C-48 (1920-21-22)

MODEL C-48, D-48 (1922)

DELCO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

BATTERY:—Willard, (1920-21) SJW-4, (1922) Type SJWR-4 6 volt, 117.5 ampere hour. The negative (—) terminal is grounded.

IGNITION:—Coil Model No. 2159. Distributor Model No. 5157. Breaker contacts separate .018 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING:—Put 4 or 5 drops of light engine oil in each of the distributor head oilers every two weeks. If the track of the rotor button is not well polished, apply a small amount of vaseline with a soft cloth. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING:—Breaker contacts begin to separate when the top dead center mark on the fly-wheel is $1\frac{3}{8}$ inches past the indicator, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER:—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS:—Spark plug gaps are .030 inch.

STARTER:—Model No. 179. Starter is connected to the engine through a Bendix drive.

OILING:—Put 5 or 6 drops of light engine oil in each of the starter oilers every month. Remove the grease plug in the reduction gear housing and inject soft cup grease every six months.

GENERATOR:—Model No. 180. Generator current regulation is by the third brush system. Maximum current output of 11-15 amperes is reached at 1200 R.P.M. of the armature or 18-24 miles per hour.

Amperes	Hot Test	R.P.M.
4		800
8		1000
11-15		1200
11-14		2000
8-12		2300

Charging rate is varied by adjusting third brush setting. Loosen the three screws holding the third brush plate, and move the third brush in a counter-clockwise direction (looking at the commutator end) to increase the charging rate. Move the brush in the opposite direction to decrease the charging rate. Tighten the screws and reset the brush after adjusting position.

OILING:—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY:—Relay is mounted on generator frame. Relay closes at 8-9 and opens at 5-7 miles per hour. Relay contacts separate .046 to .062 inch. Air gap between relay armature (moving member) and coil core is .020 to .035 inch, contacts closed. To adjust relay, connect a voltmeter between the positive generator brush and ground. Then slowly speed up the generator and adjust the relay spring tension by turning the thumb screw until the relay contacts close when the voltmeter indicates 7.5 volts. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS:—Head lamps are 6-8 volt, 21 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 3-4 volt, 2 cp. Dome lamp is 6-8 volt, 5cp. Dash, dome and step lamps have double contact base. All other lamps have single contact base. On 1920-21 cars, head lamps are 6-8 volt, 18 cp. Dimmer lamps are 6-8 volt, 5 cp.

CIRCUIT BREAKER:—A vibrating circuit-breaker takes the place of fuses. It requires 25 amperes to start the vibrator, but 3-5 amperes will cause it to continue.

Plate No. 755

RELAY:—Relay is mounted on the generator frame. Relay closes at 550-600 R.P.M. of the armature or 7-8 miles per hour, and opens at 500-550 R.P.M. of the armature or 5-6 miles per hour. Relay contacts separate .046 to .062 inch. Air gap between the relay armature and coil core is .020 to .035 inch, contacts closed. To adjust relay connect a voltmeter between the positive (+) generator brush and ground. Then slowly speed up the generator and adjust the relay spring tension by turning the thumb nut until the contacts close when the voltmeter indicates 7.5 volts. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS:—Head lamps are 6 volt, 21 cp. Dash and tail lamps are 6 volt, 2 cp. Cowl lamps are 6 volt, 6 cp. On 1920 cars, head lamps are 6-8 volt, 15 cp.

CIRCUIT BREAKER:—A vibrating circuit breaker, mounted on the back of the combination switch, takes the place of fuses. It requires 25 amperes to start the vibrator, but 3-5 amperes will cause it to continue.

TULSA
DYNETO STARTER & GENERATOR
CONNECTICUT IGNITION

Plate No. 756

TULSA

MODEL (1920-21-22)

DYNETO GENERATING, STARTING AND LIGHTING SYSTEM CONNECTICUT IGNITION

BATTERY.—Exide, Type 3-XC-15-1, 6 volt, 80 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Breaker contacts separate .018 to .024 inch. They are made of tungsten. When the condition of the contacts affects the ignition, renew the inner breaker mechanism. For temporary service, resurface contacts with fine emery cloth.

OILING.—Refill the cup under the breaker head with pure vaseline and turn down every month. If the car is driven more than 1000 miles in a month, this must be done every 1000 miles. Do not put grease or oil in the cup.

TIMING.—Breaker contacts begin to separate when the top dead center mark on the fly-wheel is $\frac{3}{4}$ inch past the indicator, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 3, 4, 2.

SPARK PLUGS.—Diameter, $\frac{7}{8}$ inch. Spark gaps are .025 inch.

STARTER.—Model No. D-162. Starter is connected to the engine through a Bendix drive. When cranking engine, starter takes 130 amperes, armature revolving at 1500 R.P.M.

Starter Data

Torque	R.P.M.	Amperes	Volts
0.0 lb. ft.	5600	25	6.4
2.5 lb. ft.	1400	150	5.8
5.0 lb. ft.	850	250	5.3
10.0 lb. ft.	250	420	4.6
14.0 lb. ft.	Lock	530	4.0

OILING.—Put several drops of light engine oil in the starter oilers every month.

GENERATOR.—Model No. C-162. Generator current regulation is by the third brush system. Maximum current output is 12-15 amperes, reached at 1200 R.P.M. of the armature or 20-25 miles per hour.

Generator Data

Amperes	Cold Test	R.P.M.	Amperes	Hot Test	R.P.M.
6		600	5		600
13		900	10		900
15		1200	12		1200
13.5		1600	11.5		1600
11.5		2000	10		2000

Shunt field current is 3.5 amperes at 6.5 volts. Charging rate is varied by adjustment of the third brush setting. Remove the leather plug in the commutator end of the generator, loosen the screw exposed and move in the direction of armature rotation to increase the charging rate. Move in the opposite direction to decrease the charging rate. Tighten the adjusting screw and replace the leather plug after adjustment is made.

OILING.—Put 4 or 5 drops of light engine oil in the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 8-10 miles per hour or 450-500 R.P.M. of armature, and opens at 6-8 miles per hour or 400-450 R.P.M. of armature. Relay contacts separate $\frac{3}{32}$ inch. Air gap between relay armature and coil core is $\frac{1}{8}$ inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dash and tail lamps are 6-8 v lt, 2 cp.

SKELTON
Model 35 (1921-1922)
Westinghouse Starter and Generator
Connecticut Ignition

Plate No. 757

SKELTON

MODEL 35 (1921-22)

WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM CONNECTICUT IGNITION

BATTERY.—Prest-O-Lite, Type 611-RHN, 6 volt, 80 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Coil Model M. Distributor Model 15TR. Breaker contacts separate .025 inch. They are made of tungsten. When the condition of the points affects the ignition, renew the inner breaker mechanism. For temporary service, resurface contacts with fine emery cloth.

Oiling.—Every 1000 miles remove the breaker box cover and put 3 or 4 drops of light engine oil around the distributor shaft. This will lubricate the lower bearing. Use care not to allow oil to reach the contact points.

Timing.—The breaker contacts begin to separate when the marking "1 and 4 DC" on the flywheel is 1 inch past the center mark on the crank case, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plug Gaps.—The spark plug gaps are .025 inch.

STARTER.—Frame 33AB. Starter is connected to the engine through a Bendix drive.

Starter Data.—33AB

Torque	R.P.M.	Amperes
0.00 lb. ft.	3700-4100	70
1.75 lb. ft.	1600	150
12.00 lb. ft.	Lock	500

Oiling.—Put 4 or 5 drops of light engine oil in each of the starter bearing oilers every month.

GENERATOR.—Frame 35 AT. Generator current regulation is by the third brush system. Generator output is varied by adjusting the third brush setting. To increase charging rate move the third brush in direction of armature rotation, and to decrease charging rate move in opposite direction. Reseat third brush after position adjustment.

Generator Data.—35AT

R.P.M.	Volts	Amperes
500	6.5	Neutral
750	8.0	8
1100-1600	8.6	15-16
2000	Hot Check	8
		10

Shunt field takes 2.5 to 3.0 amperes at 6.0 to 6.3 volts. Operating freely as a motor, current is 5 amperes at 6.0 to 6.3 volts.

Oiling.—Put 5 or 6 drops of light engine oil in each of generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 8-10 miles per hour or 500-550 R.P.M. of armature, and opens at 6-8 miles per hour, or 450-500 R.P.M. of armature. Charging current is 1 to 2 amperes at closing, and the discharge current 0 to 2 amperes at opening of relay. Air gap between relay armature (moving member) and coil core is .031 inch, contacts separated. Contacts separate .013 to .018 inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting in service.

LAMPS.—Head lamps are 6-8 volt, 18 cp. Dash and tail lamps are 6-8 volt, 2 cp.

FUSES.—Generator field fuse is 5 ampere.

TEMPLAR

MODEL 4-45 (1920-21-22)

BIJUR GENERATING, STARTING AND LIGHTING SYSTEM

SIMMS MAGNETO IGNITION

BATTERY.—(1920) Columbia, 6 volt, 100 ampere-hour. (1921-22) Prest-O-Lite, 6 volt, 115 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Breaker contacts separate .015 inch. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Put 4 or 5 drops of light machine oil in each of the magneto oilers every month. If the car is driven more than 1000 miles in a month, the oiling must be done every 1000 miles.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 3, 4, 2.

SPARK PLUG GAPS.—Spark plug gaps are .020 inch.

STARTER.—Type ED-160, M-1390. Starter is connected to the engine through a Bijur automatic pinion shift. Starter cranks the engine at 140 R.P.M., armature revolving at 1800 R.P.M., taking 160 amperes. Lock torque is 16 pound-feet, current being 665 amperes at 3.6 volts. Running freely, starter takes 30 amperes at 5.6 volts, armature revolving at 6800 R.P.M. Pressure of brushes on commutator is 35 ounces.

OILING.—Put 5 or 6 drops of light engine oil in each of the starter oilers every month.

GENERATOR.—Type L-220, M-1376. Generator current regulation is by third brush system. The maximum current output is 15 amperes, reached at 15-20 miles per hour or 1000-1500 R.P.M. of the armature. Charging rate is varied by inserting a special toothed wrench in the adjusting hole in the commutator end plate and shifting the third brush assembly through a ratchet engagement. Turn the adjusting wrench to the right (facing the commutator end) to increase the charging rate, and to the left to decrease the charging rate. Maximum current output must not exceed 15 amperes at 1400 R.P.M. Pressure of brushes on commutator is 14 ounces. Shunt field current is 2.5-3 amperes at 3.4 volts.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Type Z-7. Relay closes at 8-9 miles per hour or 550 R.P.M. of the armature and opens at 6-8 miles per hour or 450-550 R.P.M. of the armature. Relay contacts separate .015 inch. Air gap between relay armature (moving member) and coil core is .030 inch, with contacts closed. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp. Spot light is 6-8 volt, 36 cp.

FUSES.—Fuses are 20 ampere.

Plate No. 759

STUTZ

SERIES K (1921) AND KL (1922) REMY GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

BATTERY.—Willard, Type SJR-5, 6 volt, 132 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Coil Model No. 2159. Distributor Model No. 5209. Breaker contacts separate .018 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oilstone. Both sets of contacts must separate at the same instant.

Oiling.—Put 4 or 5 drops of light engine oil in each of the ignition unit oilers every two weeks. If the tracks of the rotor buttons in the distributor heads are not well polished, apply a small amount of vaseline with a soft cloth. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

Timing.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever 1½ inches from the fully retarded position. (First see that the breaker assembly is in the fully retarded position.)

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plug Gaps.—Spark plug gaps are .027 to .030 inch.

STARTER.—Model No. 741-A. Starter is connected to the engine through a set of reduction gears meshed by the operator. An overrunning clutch is provided, which permits the starting motor to turn the engine, but prevents the engine from turning the starting motor. The brush tension is 14 to 18 ounces. Running freely, the starter takes 75 amperes at 5 volts, armature revolving 2000 R.P.M. Lock torque is 66 pound-feet, current being 600 amperes at 3 volts.

Oiling.—Put 5 or 6 drops of light engine oil in the starter oilers, and turn down the grease cup two turns every 1000 miles.

GENERATOR.—Model O-F. Generator current regulation is by the third brush system. Main brush tension is 15 to 18 ounces. Third brush tension is 7-9 ounces.

Generator Data. Model O-F

Amperes	Volts	R.P.M.
0		275
7	7.15	475
12	7.65	675
15.2-17.5	7.95-8.2	1450
11.0-15.0	7.55-7.95	2000

Field current takes 1.3 amperes at 6.5 volts. The charging rate may be slightly increased by filing away the edge of the third brush farthest from the main brush, filing the edge nearest the nearest main brush decreases the charging rate. Only a small portion of the third brush may be removed or serious sparking will result.

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Model No. 264-C. Relay closes at 7-9 miles per hour or 275 R.P.M. of the armature, and opens at 6-8 miles per hour. Relay contacts separate .012 to .015 inch. Air gap between coil core and relay armature is .012 to .015 inch, contacts closed. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sand paper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 15 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp.

FUSES.—Generator fuse is 2 amperes.

STUDEBAKER

MODEL EJ (1921-22)

REMY GENERATING, STARTING AND LIGHTING SYSTEM REMY IGNITION

BATTERY.—Willard, (1921) Type SJR-4 (1922) Type SJRN-3, 6 volt, 112 ampere hour. The positive (+) terminal is grounded.

IGNITION.—Coil Model 284-A. Distributor Model 606-A. Breaker contacts separate .003 to .013 inch. When the condition of the contacts affects the ignition, resurface with a fine flat jeweler's file or a piece of well worn No. 00 sandpaper.

Oiling.—Screw up the grease cup under the breaker head one-half turn every two weeks. If the car is driven more than 500 miles in two weeks, this must be done every 500 miles. Put 3 or 4 drops of light engine oil in the wick in the breaker lever spindle every six months.

Timing.—Breaker contacts begin to separate when the flywheel marking "AD-SP" is at the indicator, spark control lever and breaker assembly in the fully advanced position.

Firing Order.—The firing order is 1, 4, 2, 6, 3, 5.

Spark Plugs.—Spark plug diameters are $\frac{7}{8}$ inch. Gaps are .025 inch.

STARTER.—Model No. 715-B. Starter is connected to the engine through a Bendix drive and a set of reduction gears.

Oiling.—Put 5 or 6 drops of light engine oil in starter oilers every month. If the car is driven more than 1000 miles in a month, the oiling must be done every 1000 miles. Once each season apply graphite grease through plug in reduction gear case.

GENERATOR.—Model 917-A. Generator current regulation is by the third brush system. Thermostat opens at 195° to 200° F., cutting down the maximum charging rate to 11 amperes. The direction of rotation is counter-clockwise, looking at the commutator end.

Cold Test		Generator Data		Hot Test	
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
7	7.1	850	6.9		1450
18-20	8.3-8.8	1800	11	8.2	1900
17-10		2500			

The brush tension is 14-18 ounces. The field draws 4.85 amperes at 6 volts. Charging rate is varied by adjusting the third brush setting. Move the third brush in the direction of armature rotation to increase the charging rate, and against the direction of rotation to decrease the charging rate. Reseat the brush after position adjustment.

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator bearing oilers every month. If the car is driven more than 1000 miles in a month, this oiling must be done every 1000 miles.

RELAY.—Model No. 264-B. Relay closes at 8-10 miles per hour, and opens at 6-8 miles per hour. Air gaps between relay armature and coil core is .012 to .015 inch, contact points closed. Contact opens .012 to .015 inch. Adjust spring tension by bending brass strip through which spring passes. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 15 cp. Dash and tail lamps are 6-8 volt, 2 cp.

FUSES.—Fuses are 10 ampere.

Plate No. 761

STUDEBAKER

MODEL EJ (1921-22)

WAGNER GENERATING, STARTING AND LIGHTING SYSTEM

WAGNER IGNITION

BATTERY.—Willard, (1921) Type SJR-4 (1922) Type SJRN-3, 6volt, 112 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Coil Model K83. Distributor Model K-97. Breaker contacts separate .024 to .029 inch. They are made of tungsten. When the condition of the contacts affects the ignition, renew the contact screw and lever arm.

Oiling.—Put 5 or 6 drops of light engine oil in the distributor bearing oilers every month. If the car is driven more than 1000 miles in a month, the oiling must be done every 1000 miles.

Timing.—Breaker contacts begin to separate when the flywheel marking "AD-SP" is at the indicator, spark control lever and breaker assembly in the fully advanced position.

Firing Order.—The firing order is 1, 4, 2, 6, 3, 5.

Spark Plug Gaps.—The spark plug gaps are .025 inch.

STARTER.—Model EM 356, Type 36T. Starter is connected to the engine through a Bendix drive. Starter cranks the engine at 125 R.P.M., taking a current of 160 amperes. Lock torque is 11.5 pound-feet, current being 475 amperes. Running freely, starter takes 60-90 amperes, armature revolving 8000 R.P.M.

Oiling.—Put 5 or 6 drops of light engine oil in starter oilers every month.

GENERATOR.—Model EM-355, Type 46-V. Generator current regulation is by the third brush system. Maximum charging rate is 12 amperes, reached at 20-23 miles per hour.

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Model I-471. Relay closes at 8-10 miles per hour or 640-800 R.P.M. of the armature, and opens at 6-8 miles per hour or 480-640 R.P.M. of the armature. Charging current at closing is 2 amperes, and the discharge current is 0-4 amperes at opening of relay contacts. Relay contacts separate .035 to .065 inch. Air gap between relay armature (moving member) and coil core is .025 inch, contacts closed. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 15 cp. Dash and tail lamps are 6-8 volt, 2 cp.

FUSES.—Fuses are 10 ampere.

Plate No. 762

STUDEBAKER

MODEL EG-EH (1921-22)

REMY GENERATING, STARTING AND LIGHTING SYSTEM

REMY IGNITION

BATTERY.—Willard, Type SJR-4, 6 volt, 115 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Coil Model 284-D. Distributor Model 358-A. Breaker contacts separate .020 inch. When the condition of the points affects the ignition, resurface with a fine flat jeweler's file or worn No. 00 sandpaper.

Oiling.—Screw up the grease cup under the breaker head one-half turn every two weeks. If the car is driven more than 500 miles in two weeks, this must be done every 500 miles. Put 3 or 4 drops of light engine oil in the wick in the breaker lever spindle every six months.

Timing.—Breaker contacts begin to separate when the flywheel marking "AD-SP" is at the indicator, spark control lever and breaker assembly in the fully advanced position.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—Spark plug gaps are .025 to .028 inch.

STARTER.—Model No. 736-A. Starter is connected to the engine through a chain drive and an overrunning clutch. Brush tension is 16-20 ounces. Running freely, starter takes 75 amperes at 5 volts, armature revolving approximately 900 R.P.M. Lock torque is 5.5 pounds-feet, current being 600 amperes at 3 volts.

Oiling.—Put 4 or 5 drops of light engine oil in each starter oiler every 1000 miles. Once each year remove the grease plug in the reduction gear case and repack with graphite cup grease. Every three months oil the starter clutch in the sprocket on the engine crankshaft with light engine oil through the oil hole on the forward side.

GENERATOR.—Model No. 917-E. Generator current regulation is by the third brush system. The direction of rotation is counter-clockwise, looking at the commutator end. A thermostat in the shunt field circuit cuts in a resistance that lowers the generator output approximately 50%.

Generator Data

Cold			Hot		
Amperes	Cut in	R.P.M.	Amperes	Volts	R.P.M.
0	6.7	675			
7	7.1	850	6-9		1450
18-20	8.3-8.8	1800	11	8.2	1900
17-10		2500			

The brush tension is 14-18 ounces. The field draws 4.85 amperes at 6 volts. Charging rate is varied by adjusting the third brush setting. Move the third brush in the direction of armature rotation to increase the charging rate, and against the direction of rotation to decrease the charging rate. Reseat the brush after position adjustment.

Oiling.—Put 4 or 5 drops of light engine oil in each generator oiler every 1000 miles.

RELAY.—Model 263-F. Relay is mounted on the dash. Relay contacts close at 8-10 M.P.H. with a generator voltage of 7.2 volts and open at 6-8 M.P.H. with a discharge current of 0-2.5 volts. Contacts separate .014 inch. Air gap between relay armature and coil core is .014 inch, contacts closed. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well-worn No. 00 sandpaper. Remove all grit and adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 15 cp. Dash, tail and tonneau lamps are 6-8 volt, 2 cp. Side lamps are 6-8 volts, 4 cp.

FUSES.—The fuses are 10 amperes

Plate N . 763

FUSES.—Generator fuse is 5 amperes. Lighting circuit fuses are 20 amperes.

VELIE
MODEL "48"
BIJUR STARTER & GENERATOR
ATWATER KENT IGNITION

Plate No. 764

VELIE

MODEL 48 (1920-21-22)

BLUR GENERATING, STARTING AND LIGHTING SYSTEM AT WATER-KENT IGNITION

BATTERY.—Willard, Type SJRN-4, 6 volt, 120 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Type CC. Breaker contacts separate .006 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING.—Remove the distributor cap every two weeks, and put 4 or 5 drops of light engine oil in the oil hole exposed. Put a small amount of vaseline on the cam, applying with a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when piston entering power stroke is on top dead center, spark control and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .025 inch.

STARTER.—Type ED-160, M-1316. Starter is connected to the engine through a Bendix drive. Lock torque is 16.5 pound-feet, taking 665 amperes at 3.6 volts. Running freely, starter takes 30 amperes, armature revolving at 6800 R.P.M. Pressure of brushes on commutator is 25 ounces.

OILING.—Put 5 or 6 drops of light engine oil in each of the starter bearing oilers every month.

GENERATOR.—Type L-61, M-1287. Generator current regulation is by third brush system. Maximum current output is 15 amperes, reached at 1400-1600 R.P.M. of the armature, or 15-20 miles per hour. Charging rate is varied by inserting a special toothed wrench in the adjusting hole in the commutator end plate and moving the third brush assembly through a ratchet engagement. Turn the adjusting wrench in a clockwise direction to increase the charging rate and in a counter-clockwise direction to decrease the charging rate.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted in generator frame. Relay closes at 8-10 miles per hour or 550-600 R.P.M. of the armature and opens at 6-8 miles per hour or 500-550 R.P.M. of the armature. Relay contacts separate .045 inch. Air gap between relay armature and coil core is .030 inch, contacts closed. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No.00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 15 cp. Dimmer lamps are 6-8 v lt, 4 cp. Dash and tail lamps are 6-8 volt, 4 cp.

FUSE.—Fuses are 15 ampere.

Plate No. 765

NATIONAL **SERIES 'BB' (1919-20-21-22) SERIAL NOS. 60001 UP.** **WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM** **DELCO IGNITION**

IGNITION.—Coil Model No. 2159. Distributor Model No. 5175 or 5211. Breaker contacts separate .018 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel.

OILING.—Put 4 or 5 drops of light engine oil in the distributor shaft bearings every two weeks. If the track of the rotor button is not well polished, apply a small amount of vaseline with a soft cloth. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when the top dead center mark on the fly-wheel is $\frac{3}{4}$ inch past the indicator, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .025 to .030 inch.

STARTER.—Frame 571. Starter is connected to the engine through a Bendix drive.

Starter Data

Torque	R.P.M.	Amperes
2.5 lb. ft.	1450	140
7.5 lb. ft.	1150	200
12.5 lb. ft.	650	400
17.5 lb. ft.	500	530
21.0 lb. ft.	Lock	650

OILING.—Put 4 or 5 drops of light engine oil in each of starter oilers every month.

GENERATOR.—Frame 760. Generator current regulation is by third brush system. Maximum charging rate is 15-17 amperes, reached at 1250 R.P.M. of the armature or 16-20 miles per hour.

Cold Test

Generator Data

Hot Test

Amperes	R.P.M.	Amperes	R.P.M.
0	450	0	500
8	675	6	725
12	840	9	850
15-17	1250	11-13	1250
10	2000	7-8	2000

The cold test readings are obtained with a generator temperature under 95°F. The hot test readings are obtained after the generator has been operated an hour at 1800 R.P.M., charging a half-charged battery. Shunt field current is 2.8 to 3.25 amperes, when 6 volts pressure is applied to its terminals. When generator is operating freely as a motor, current is 3.5 to 5 amperes at 6 to 6.6 volts.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted in generator frame. Relay closes at 450-500 R.P.M. of the armature or 8 miles per hour, and opens at 400-450 R.P.M. of the armature or 6 miles per hour. Charging current is 1-2 amperes at closing, and the discharge current 0-2 amperes at opening of relay contacts. Contacts separate .013 to .018 inch. The air gap between the armature (moving member) and coil core is .031 inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 20 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp.

CIRCUIT BREAKER.—A vibrating circuit-breaker takes the place of fuses. It requires a current of 25 amperes to start this device vibrating. While vibrating, the current is 3.5 amperes.

Plate No. 766

ROAMER

MODEL 6-54-E (1922) BIJUR GENERATING, STARTING AND LIGHTING SYSTEM BOSCH IGNITION

BATTERY.—Columbia, Type S-313-A, 6 volt, 117 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Breaker contacts separate .014 to .016 inch. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Put 2 or 3 drops of light machine oil in each of the magneto oilers every month. Put a small amount of vaseline on the fiber bumper of the contact arm, applying with a toothpick. If the car is driven more than 1000 miles in a month, these attentions must be given every 1000 miles.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .025 inch.

STARTER.—E.D.-160, M-979. Rotation is counter-clockwise, looking at commutator end. Starter is connected to the engine through a Bendix drive. Lock torque is 16.5 pound-feet, current being 665 amperes at 3.6 volts. Running freely, armature revolves at 6800 R.P.M., taking 30 amperes. Pressure of brushes on commutator is 25 ounces.

OILING.—Put several drops of light engine oil in each of the starter bearings every month.

GENERATOR.—Type L-61, M-1204. Rotation is counter-clockwise, looking at commutator end. Generator current regulation is by third brush system. Maximum current output is 15 amperes, reached at 20 miles per hour or 1400 R.P.M. of the armature. Charging rate is varied by inserting a special toothed wrench in the adjusting hole in the commutator end plate and shifting the third brush assembly through a ratchet engagement. Turn the adjusting wrench to the right (facing commutator end) to increase the charging rate. Maximum current output must not exceed 15 amperes at 1400-1600 R.P.M. Pressure of brushes on commutator is 14 ounces. There is a 10 ampere fuse mounted on the generator frame to protect the field winding should excessively high resistance occur in the charging circuit.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 8-9 miles per hour or 550-600 R.P.M. of the armature and opens at 7-8 miles per hour or 500-550 R.P.M. of the armature. Relay contacts separate .045 inch. Air gap between relay armature (moving member) and coil core is .035 inch, contacts closed. To adjust relay, connect a voltmeter across the main brushes of the generator. Then insert a special wrench in the small adjusting hole in the commutator end plate and adjust relay spring tension until the contacts close when the voltage reaches 6.5 volts. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6 volt, 21 cp. Dimmer and dome lamps are 6 volt, 4 cp. Dash, tail and tonneau lamps are 6 volt, 4 cp.

Plate No. 767

BATTERY.—Willard, Type SJRG, 6 volt, 118 ampere-hour! The positive (+) terminal is grounded.

IGNITION.—Coil Model N . 2159, Distributor Model No. 5157. Breaker contacts separate .018 inch. They are made of tungsten. When the condition of the points affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING.—Put 4 or 5 drops of light engine oil in each of the ignition head oilers every two weeks. If the track of the rotor button in the distributor head is not well polished, apply a small amount of vaseline with a soft cloth. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when the flywheel marking "1-6" is at the indicator, spark control one-third advanced.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .025 to .028 inch.

STARTER.—Frame No. 710. Starter is connected to the engine through a Bendix drive. Starter cranks the engine at 125 R.P.M., taking 275 amperes

Starter Data		
Torque	R.P.M.	Amperes
0 lb. ft.	4000	40
4 lb. ft.	1000	180
8 lb. ft.	700	280
14 lb. ft.	Lock	450

OILING.—Put 5 or 6 drops of light engine oil in each of starter oilers every month.

GENERATOR.—Frame No. 760. Generator current regulation is by third brush system. Current output is varied by adjustment of third brush setting. Set the third brush so that at 1100-1500 R.P.M. the maximum current output is 15 to 17 amperes, at 7½ volts. The cold test readings are obtained with the normal setting of third brush, and a generator temperature under 35°C. (95°F.). The hot test readings are obtained after the generator has been operated one hour at 1800 R.P.M., charging a half-charged battery or its equivalent.

Generator Data.—Cold Test.

R.P.M.	Amperes	Voltage
500	0	6.5
750	8	6.5
1250	15-17	7.5
2500	7-11	6.5-7.5

Generator Data.—Hot Test

R.P.M.	Amperes	Voltage
1250	12-14	7.5
2500	7-11	6.5-7.5

Field current is 2.8 to 3.25 amperes, 6 volts. Field resistance is 1.9 to 2.25 hms at 25°C. (77°F.).

Field Test, Generator Operating

Cold Test			
R.P.M.	Generator Output Amperes	Generator Voltage	Field Current
1250	15-17	7.5	1.5-2.4

Hot Test			
R.P.M.	Generator Output Amperes	Generator Voltage	Field Current
1250	12-15	7.5	1.5-2.2

Operating freely as a motor current flow is 3.5 to 5 amperes, 6 to 6.6 volts.

OILING.—Put 5 or 6 drops of light engine oil in each of generator oilers every two weeks. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.

RELAY.—Relay closes at 8-10 miles per hour or 500-550 R.P.M. of armature, and opens at 6-8 miles per hour, or 450-500 R.P.M. of armature. Charging current is 1 to 2 amperes at closing, and the discharge current 0 to 2 amperes at opening of relay. Air gap between relay armature (moving member) and coil core is .031 inch, contacts separated. Contacts separate .013 to .018 inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 20 cp. Dimmer lamps are 6-8 volt. 4 cp. Tail, dash and tonneau lamps are each 6-8 volt. 2 cp.

SCINTILLA MAGNETO
Types AM8 and AG8
Type Used on Eight Cylinder Cars
Plate No. 769

SCINTILLA MAGNETO

TYPES AM4, AG4, AM6, AG6, AM8, AG8, MP2, MG2

ROTATION.—The direction in which the magneto operates is indicated by an arrow on the magneto cover.

BREAKER.—The contact points are made of platinum-iridium and separate .013 inch. The complete breaker assembly may be removed by hand for cleaning and inspection. The contact points seldom require resurfacing, but if their condition affects the ignition, they should be resurfaced with a fine, flat jeweler's file.

OILING.—Put 5 or 6 drops of light engine oil in the two oil wells every 500 miles.

TIMING.—1st. When the maximum advance of the magneto is known:

Turn the engine over until the piston in Number 1 cylinder is in the position where the fully advanced spark should occur. Then turn the magneto shaft until Number 1 on the distributor gear wheel corresponds with the index in the timing window in the front end plate. At this moment the contact points begin to separate, provided the advance lever is set at full advance (opposite to the direction in which the magneto rotates). Contact is then made between the corresponding segment on the distributor cylinder and terminal Number 1 on the distributor carbon brush holder.

2nd. When the maximum advance of the magneto is not known:

Turn the engine over until the piston in Number 1 cylinder is on top dead center. Set the advance lever at full retard (in the same direction in which the magneto rotates), and turn the magneto shaft until Number 1 on the distributor gear wheel has passed the timing window and the contact points just begin to open. To see the breaker points, remove the contact breaker cover by releasing the two spring clamps. Tighten the coupling and fasten the magneto securely to the base. Connect terminal Number 1 to the spark plug in cylinder Number 1. Then follow the firing order of the magneto as marked on the distributor carbon brush holders, that is: 1, 2, 3, 4, 5, 6, 7, 8, and connect the cables to the spark plugs in accordance with the firing order of the engine.

SPARK PLUG GAPS.—The spark plug gaps should be .020 inch.

FORD

1921-1922

LIBERTY GENERATING, STARTING AND LIGHTING SYSTEM FORD IGNITION

BATTERY.—Ford, Exide, U. S. L., or Prest-O-Lite, 6 volt, 80 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—The magneto is carried in the flywheel housing. There should be a clearance of .031 inch, between the coil cores and the magnet pole pieces. The magnet delivers alternating current to four vibrator ignition coils, one connected to each spark plug, as the timer closes the circuit in the proper sequence. When the vibrator arm is held down, the contacts should separate .030 inch. If the contacts are badly burned or pitted, resurface with a fine, flat jeweler's file or on a medium hard oilstone. Coils should be adjusted to draw 1.3 amperes at 6 volts.

Oiling.—Put several drops of light engine oil in the spring oiler of the timer every two weeks. In cold weather a mixture of 1/4 kerosene and 3/4 light engine oil should be used.

Timing.—Timer roller should just make connection with segment connected to Number 1 coil when the piston in Number 1 cylinder is on top dead center of the power stroke, spark control lever and timer housing in the fully retarded position.

Firing Order.—The firing order is 1, 2, 4, 3.

Spark Plug Gaps.—The spark plug gaps are .030 to .032 inch.

STARTER.—Type F.A. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter cranks the engine at 150 R.P.M., taking 160 amperes at 5 volts.

Starter Data.—F.A.

Torque	R.P.M.	Volts	Amperes
1 lb. ft.	2500	5.5	125
5 lb. ft.	1050	4.4	330
9 lb. ft.	425	3.6	465
13 lb. ft.	Lock	3.0	580

Oiling.—Starter requires no oiling.

GENERATOR.—Type F.A. Generator current regulation is by the third brush system. Direction of rotation is counter-clockwise, looking at the commutator end.

Generator Data.—F.A.

Amperes	Volts	R.P.M.
4.1	6.6	800
9.0	7.4	1100
11.5	7.9	1400
12.5	8.2	1700
11.0	8.1	2000

Charging rate is varied by adjustment of the third brush setting. Loosen the clamp nut holding the third brush holder. Move third brush in the direction of armature rotation to increase the charging rate, or in the opposite direction to decrease the charging rate. Clamp the third brush after position adjustment. The generator fields draw 2.4 amperes at 6 volts.

Oiling.—Put 4 or 5 drops of light engine oil in the rear generator bearing oiler every two weeks. If the car is driven more than 500 miles in 2 weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted on the generator frame. Relay closes at 600-650 R.P.M. of armature or 8-10 miles per hour, and opens at 550-600 R.P.M. of armature or 6-8 miles per hour, the discharge current being 0-2 amperes. Relay contacts separate .032 inch. If badly burned or pitted resurface with worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dimmer and tail lamps are 6-8 volt, 2 cp.

FORD
Model T (1921-1922)
Ford-Liberty System

Plate No. 770

STANLEY STEAMER
REMY GENERATOR

Plate No. 771

STANLEY STEAMER

MODEL (1920-21-22) SERIAL NOS. 19,000 UP

REMY GENERATING SYSTEM

BATTERY.—Willard, Type SJRN-3, 6 volt, 100 ampere-hour. The negative (—) terminal is grounded.

GENERATOR.—Model No. 239-A. Generator current regulation is by the third brush system. A thermostat, located in the brush rigging of the generator, cuts a resistance into the field circuit when the temperature of the generator reaches 175° F., reducing the maximum charging rate 6 amperes. The thermostat is intended to change the charging rate as demands of the seasons or car operation requires. Never touch the thermostat points. The maximum current output is 19-20 amperes, reached at 1680 R.P.M. of the armature or 20-25 miles per hour.

Generator Data		
Amperes	R.P.M.	Volts
0	525	6.4
7	780	7.1-7.2
14	1100	7.8
19.5-20.5	1680	7.8
19.0-20.0	2000	8.6
13.0-15.0	3000	8.0

Above tests are made with the relay in the circuit and thermostat points closed. Shunt is 17-20 ounces. Pressure of the third brush is 13-17 ounces. Charging rate is varied field current is 5 amperes at 6.4 volts. Pressure of the main brushes on the commutator by adjusting the third brush setting. Third brush is moved by turning a screw, exposed in the commutator end plate. Turn the screw in a clockwise direction (looking at the commutator end) to increase the charging rate and in a counter-clockwise direction to decrease the charging rate.

OILING.—Put 4 or 5 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 8-10 miles per hour or 525-600 R.P.M. of the armature, and opens at 6-8 miles per hour or 450-525 R.P.M. of the armature. Relay contacts separate .012 to .015 inch. Air gap between relay armature (moving member) and coil core is .012 to .015 inch, contacts closed. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash, tail and trouble lamps are 6-8 volt, 2 cp.

FUSES.—Fuse is 20 ampere-

CLEVELAND

MODEL 41 (1922)

BOSCH GENERATING, STARTING AND LIGHTING SYSTEM BOSCH MAGNETO IGNITION

BATTERY.—Prest-O-Lite, Type 611-RHN, 6 volt, 94 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Type B-6. Breaker contacts separate .014 to .016 inch. They are made of platinum. When the condition of the contacts affects the ignition, resurface them with a fine flat jeweler's file.

Oiling.—Put 3 or 4 drops only of light machine oil in the oil cup at the side of the distributor housing every 500 miles. Care must be taken not to over oil the magneto.

Timing.—Breaker contacts begin to separate when the flywheel marking "DC 1&6" has 1/8 inches to travel before reaching the mark on the hole in the flywheel housing, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—The spark plug gaps are .021 inch.

STARTER.—Model No. 900. Direction of rotation is counter-clockwise, looking at the commutator end. Starter is connected to the engine through a Bendix drive. Starter cranks the engine at 110 R.P.M., taking 150 amperes. Running free, the current is 45-50 amperes.

Starter Data.—No. 900

Torque	R.P.M.	Amperes
2 lb. ft.	1600	130
6 lb. ft.	600	280
10 lb. ft.	250	410
12 lb. ft.	125	465
15 lb. ft.	Lock	540

The pressure of the brushes on the commutator is 2 pounds.

Oiling.—Oilless bearings are used. No oil is required.

GENERATOR.—Model No. 1000. The direction of rotation is counter-clockwise, looking at the commutator end. The maximum charging rate is 15 amperes, reached at 1600 R.P.M. of the armature, or 37 miles per hour.

Generator Data.—Model 1000

Hot Test		Cold Test	
Amperes	R.P.M.	Amperes	R.P.M.
0	550	0	500
4	760	4	640
8	1100	12	1100
10	1600	15	1600
8	2280	12	2240

The pressure of all of the brushes on the commutator is 1 3/4 pounds.

Oiling.—Put 4 or 5 drops of light engine oil in the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted on the generator frame. Relay closes when the voltage reaches 6.5 to 7.5 volts, and opens when there is a discharge current of 0.2 amperes. The contacts separate .012 to .015 inch. The air gap between the coil core and the relay armature is .018 inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with worn No. 000 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dash, tail and tonneau lamps are 6-8 volt, 2 cp. Side lamps are 6-8 volt, 4 cp.

FUSES.—Lighting fuse is 20 ampere. Generator fuse is 5 ampere.

NASH
Models 691 to 697 Inclusive (1922)
Delco System
Plate No. 773

BATTERY.—Willard, Type SJRN-4, 6 volt, 111 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Coil Model No. 2159. Distributor Model No. 5244. Breaker contacts separate .020 to .0275 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface lightly on an oil stone.

Oiling.—Put 3 or 4 drops of light engine oil in the distributor oiler every 500 miles. If the track of the rotor button is not well polished, apply a very small amount of vaseline. Put a very small amount of soft grease or vaseline on the face of the breaker cam every 1000 miles. Pack the distributor housing with soft grease to a level above the advance ring and yoke once each season.

Timing.—Breaker contacts begin to separate when the piston entering the power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—The spark plug gaps are .025 to .028 inch.

STARTER.—Model No. 230. Starter is connected to the engine through a set of reduction gears meshed by the operator. An overrunning clutch prevents the starter armature from being driven at excessive speed by the engine flywheel after the engine has started running under its own power. The direction of rotation is clockwise, looking at the commutator end. The lock torque is 21 to 23 pound-feet at 4 volts, the current being 560 amperes. The brush tension is 2 1/4 pounds.

Oiling.—Put 4 or 5 drops of light engine oil in each of the two starter oilers each month. Remove the grease plug in the side of the reduction gear housing and repack the housing with medium cup grease once or twice each season. Every 2000 miles withdraw the starter from the engine and saturate the wick under the oiler on the outward bearing of the splined shaft with light engine oil.

GENERATOR.—Model No. 229. The direction of rotation is clockwise, looking at the commutator end. Generator current regulation is by the third brush system. Generator is belt driven, and care must be taken that the belt is not tight enough to cause undue wear to the armature bearings and should not be loose enough that the generator armature will rotate when the ignition switch is "On" with the engine stopped. To adjust the belt tension, loosen the clamp screws holding the generator to the engine and shift the position of the generator slightly.

Amperes	Generator Data.—No. 229	R.P.M.
Neutral		650
4		800
8		1000
12-16		1600
8-12		2300

The charging rate is varied by adjustment of the third brush setting. Remove the cover band, loosen the two adjusting screws attaching the third brush arm to the mounting plate. Move the third brush in the direction of armature rotation to increase the charging rate, or in the opposite direction to decrease the charging rate. Tighten the adjusting screws and be sure that all of the brushes are well seated.

Oiling.—Put 3 or 4 drops of light engine oil in each of the generator oilers every 500 miles.

RELAY.—There is no relay. The circuit between the generator and the battery is controlled by the ignition switch.

LAMPS.—Head lamps are 6-8 volts, 21 cp. Dimmers are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp. Tonneau lamp is 6-8 volt, 2 cp.

CIRCUITBREAKER.—A vibrating circuit breaker takes the place of fuses. A current of 25 amperes starts the vibrator, which will continue with a current of 3-5 amperes until the switch is opened or the cause is removed.

MODEL 43-A (1921-1922)

AUTOLITE GENERATING, STARTING AND LIGHTING SYSTEM

REMY IGNITION

BATTERY.—Willard, Type SJRN-4, 6 volt, 80 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 287-A. Distributor Model No. 350-A. Breaker contacts separate .020 to .025 inch. When the condition of the contacts affects the ignition, resurface them with a fine, flat jeweler's file or worn No. 00 sandpaper.

Oiling.—Fill the grease cup under the distributor head with soft cup grease and turn down two or three turns every 1000 miles.

Timing.—Breaker contacts begin to separate when the piston entering the power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 2, 4, 3.

Spark Plug Gaps.—The spark plug gaps are .030 inch.

STARTER.—Model M.E. 1067. Starter is connected to the engine through a Benrix drive. The direction of rotation is counter-clockwise, looking at the commutator end.

Starter Data.—Model M.E. 1067

Torque	R.P.M.	Amperes	Volts
2 lb. ft.	1600	160	5.2
4 lb. ft.	1080	230	4.8
6 lb. ft.	720	300	4.5
8 lb. ft.	460	360	4.2
9 lb. ft.	350	390	4.0

Stall Torque Data

Volts	Amperes	Torque
2	300	7.2 lb. ft.
4	600	17.2 lb. ft.
5	750	23.0 lb. ft.

The above readings obtained using 100 ampere-hour battery of 1.300 specific gravity at 100°F.

Oiling.—Put 5 or 6 drops of light engine oil in the starter oilers every 1000 miles.

GENERATOR.—Model G.H.—The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system.

Generator Data.—Model G.H.

Amperes	R.P.M.	Volts
0.0	550	6.2
10.0	1000	7.2
15.1	1500	7.8
16.3	2000	8.0
15.1	2500	7.8

Fields should draw 2 amperes at 6 volts. Charging rate is varied by the adjustment of the third brush setting. Loosen the stud which clamps the third brush plate. Move the third brush in the direction of armature rotation to increase the charging rate, or in the opposite direction to decrease the charging rate. Tighten the stud and reseat the brush after position adjustment.

Oiling.—Put 5 or 6 drops of light engine oil in the generator oilers every 1000 miles.

RELAY.—The relay is mounted on the dash. Relay closes when the voltage of the generator reaches 6.5 to 7.0 volts, and opens when there is a discharge current of 0 to 2 amperes. Relay contacts separate .020 inch. The air gap between the relay armature and coil core is .010 to .025 inch, contacts closed. Clean relay contacts by drawing unglazed paper between them. If badly pitted resurface them with worn No. 00 sandpaper. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 15 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp.

FUSES.—Fuse is 5 ampere.

1922 MODEL

BOSCH GENERATING, STARTING AND LIGHTING SYSTEM BOSCH MAGNETO IGNITION

BATTERY.—Prest-O-Lite, Type 613-RHN, 6 volt, 105 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Type B-6. Breaker contacts separate .014 to .016 inch. They are made of platinum. When the condition of the contacts affects the ignition, resurface them with a fine, flat jeweler's file.

Oiling.—Put 3 or 4 drops only of light machine oil in the oil cup at the side of the distributor housing every 500 miles. Care must be taken not to over oil the magneto.

Timing.—Breaker contacts begin to separate when the piston entering the power stroke is on top dead center and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—The spark plug gaps are .027 to .030.

STARTER.—Type 901. The direction of rotation is counter-clockwise, looking at the commutator end. Starter is connected to the engine through a Bendix drive. Starter cranks the engine at 105 R.P.M., taking 150 amperes.

Starter Data.—No. 901

Torque	R.P.M.	Amperes
2 lb. ft.	1600	130
6 lb. ft.	600	280
10 lb. ft.	250	410
12 lb. ft.	125	465
15 lb. ft.	Lock	540

The pressure of all of the brushes on the commutator is 1¾ pounds.

Oiling.—Oilless bearings are used. No oil is required.

GENERATOR.—Model No. 1001. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. The maximum charging rate is 15 amperes, reached at 1600 R.P.M. of the armature, or 36 miles per hour.

Generator Data.—No. 1001

Amperes	Hot Test	R.P.M.	Amperes	Cold Test	R.P.M.
0		550	0		500
4		760	4		640
8		1100	12		1100
10		1600	15		1600
8		2280	12		2240

The pressure of all of the brushes on the commutator is 1¾ pounds.

Oiling.—Put 4 or 5 drops of light engine oil in the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted on the generator frame. Relay closes when the voltage reaches 6.5 to 7.5 volts and opens when there is a discharge current of 0 to 2 amperes. Contacts separate .012 to .015 inch. The air gap between the coil core and the relay armature is .018 inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dimmer lamps are 6-8 volt, 4 cp. Side lamps 6-8 volt, 8 cp. Dash, tail and tonneau lamps are 6-8 volt, 2 cp.

FUSES.—Lighting fuses are 20 ampere. Generator field fuse is 5 ampere.

HUPMOBILE

SERIES R (1922)

WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM ATWATER KENT IGNITION

BATTERY.—Willard, Type SJRG-4, 6 volt, 117½ ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Type CC. Breaker contacts separate .006 to .008 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oilstone. Ignition current is 3.5-4 amperes, engine idle, breaker contacts and ignition switch closed.

Oiling.—Remove the distributor cap every two weeks, and put 4 or 5 drops of light engine oil in the oil hole exposed. Apply a small amount of vaseline to the cam with a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

Timing.—Breaker contacts begin to separate when the top dead center mark on the flywheel is 2 inches past the indicator, spark control lever and breaker assembly midway between the fully retarded and fully advanced positions.

Firing Order.—The firing order is 1, 2, 4, 3.

Spark Plug Gaps.—Spark plug gaps are .020 to .022 inch.

STARTER.—Frame No. 33A.B. Style 298,808. The direction of rotation is counter-clockwise, looking at the commutator end. Running free the starter armature revolves at 3700-4100 R.P.M., taking 70 amperes at 5.5 volts. The torque at 1600 R.P.M. is 1.75 pound-feet, the current being 150 amperes at 5.5 volts. The lock torque is 12 pound-feet at 4 volts, the current being 500 amperes. The pressure of the brushes on the commutator is 1 to 1½ pounds.

Oiling.—Put 5 or 6 drops of light engine oil in each of the starter bearing oilers every month.

GENERATOR.—Frame 760. Style 275,601. Generator current regulation is by the third brush system. Maximum current output is 10-12 amperes (hot) at 1250 R.P.M. of the armature, or 20-25 miles per hour.

Generator Data

Amperes	Cold Test	R.P.M.	Amperes	Hot Test	R.P.M.
0	_____	450	0	_____	500
8	_____	675	6	_____	725
15-17	_____	1250	10-12	_____	1250
12	_____	840	9	_____	850
10	_____	2000	7-8	_____	2000

The cold test readings are obtained with a generator temperature under 95°F. The hot test readings are obtained after generator has been operated one hour at 1800 R.P.M., charging a half-charged battery. Shunt field current is 2.8 to 3.25 amperes at 6.0 to 6.6 volts. Operating as a motor the generator takes 5.0 amperes at 6.0 to 6.3 volts.

Oiling.—Put 5 or 6 drops of light engine oil in the commutator end bearing oiler every two weeks. If the car is driven more than 500 miles in two weeks the oiling must be done every 500 miles.

RELAY.—Style 262,982. Relay is mounted in the generator frame. Relay closes at 10 miles per hour or 500 R.P.M. of the armature, or at a voltage of the generator of 6.5 volts, and opens when there is a discharge of from 0 to 3 amperes. The contacts separate .030 to .035 inch. The air gap between the relay armature and the coil core is .005 inch, contacts closed. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dash and tail lamps are 6-8 volt, 2 cp.

FUSES.—Lighting circuit fuses are 10 ampere. Generator field fuse is 5 ampere.

SAXON DUPLEX

MODEL 125-G (1921-1922)

WAGNER GENERATING, STARTING AND LIGHTING SYSTEM WAGNER IGNITION

BATTERY.—Prest-O-Lite, Type 613RHN, 6 volt, 100 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Coil Model K.D. 286. Distributor Model K.D. Breaker contacts separate .020 to .025 inch. When the condition of the points affects the ignition, renew the breaker lever and contact screw.

Oiling.—Screw up the grease cup under the breaker head one-half turn every two weeks. If car is driven more than 500 miles in two weeks, this must be done every 500 miles. Put 3 or 4 drops of light engine oil on the wick in the breaker lever spindle every six months.

Timing.—Breaker contacts begin to separate when piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plug Gaps.—The spark plug gaps are .030 inch.

STARTER.—Model 36-T, Type E.M. 396. Starter is connected to the engine through a Bendix drive. The direction of rotation is clockwise, looking at the commutator end. Starter cranks the engine at 170 R.P.M., taking 125 amperes. The lock torque is 13 foot-pounds, the current being 600 amperes. Running freely the starter current is 60-90 amperes, the armature revolving 8000 R.P.M.

Oiling.—Put 5 or 6 drops of light engine oil in the starter oilers every month.

GENERATOR.—Model 46-V-5, Type E.M. 395. Generator current regulation is by the third brush system. The direction of rotation is counter-clockwise, looking at the commutator end. The peak setting should be 16 amperes at 8.6 volts.

Generator Data.—E.M. 395

Amperes	R.P.M.
5	700
12	1000
16	1400
14	2000
10	2600

The charging rate is varied by adjustment of the third brush setting. After loosening the third brush locking screw, which is sealed into place in the commutator end, the brush may be moved in either direction. Move in the direction of rotation to increase the charging rate, or in the opposite direction to decrease the charging rate. Tighten the locking screw and reseal the brush after position adjustment.

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—The relay is mounted on the dash. Relay closes when the voltage of the generator reaches 6.5 to 7.0 volts, and opens when there is a discharge current of 0 to 2 amperes. The contacts separate .035 to .065 inch. The air gap between the relay armature and coil core is .025 inch, contacts closed. Clean relay contacts by drawing glazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 17 cp. Dash, tail and tonneau lamps are 6-8 volt, 2 cp.

FUSES.—Fuses are 15 ampere.

CHEVROLET

MODEL 490 (1922)

AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM

REMY IGNITION

BATTERY.—Willard, Type SJXR-3, 6 volt, 90 ampere-hour. The negative (—) terminal is grounded at the starting motor.

Ignition.—Breaker contacts separate .030 inch. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

Oiling.—Refill the grease cup under the breaker head with soft cup grease and turn bumper of the contact arm, applying with a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

Timing.—Breaker contacts begin to separate when the piston entering the power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 2, 4, 3.

Spark Plug Gaps.—Spark plug gaps are .030 inch.

STARTER.—Model MF. Rotation is counter-clockwise, looking at the commutator end. Starter is connected to the engine through a Bendix drive. Starter cranks the engine at 150 to 160 R.P.M., normally, taking 160 amperes

Starter Data.—Model MF

Torque	R.P.M.	Amperes	Volts
2.0 lb. ft.	1550	190	5.1
4 lb. ft.	960	295	4.5
6 lb. ft.	500	390	4.0
7.5 lb. ft.	100	460	3.7

Stalled Torque Data

Volts	Lock Torque
2.0 _____	5.6 lb. ft.
3.5 _____	10.4 lb. ft.
5.0 _____	15.0 lb. ft.

The brush tension is 2 pounds.

Oiling.—Thoroughly clean out and repack the starter bearings with soft cup or ball-bearing grease every six months.

GENERATOR.—G.H. 1012. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system.

Generator Test Data

Amperes	Hot Test	R.P.M.	Amperes	Cold Test	R.P.M.
0		700	0		660
6		1200	6		1000
10		1700	10		1300
12		2000	12		1500
13		2400	16		2400

The brush tension is 2 pounds. Charging rate is varied by adjustment of the third brush setting. Move the third brush in a counter-clockwise direction, looking at the commutator end, to increase the charging rate and in the opposite direction to decrease the charging rate. Reseat the brush after adjusting the position. Operating freely as a motor, generator takes 2.7 amperes, armature revolving at 450 R.P.M. Shunt field winding takes 1.7 amperes.

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks the oiling must be done every 500 miles.

RELAY.—Relay closes at 10 miles per hour or 700 R.P.M. of the armature, and opens at 9 miles per hour or 600 R.P.M. of the armature. The discharge current is 0 to 2 amperes at opening of relay contacts. Clean the relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface them with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 17 cp. Tail lamp is 6-8 volt, 2 cp. Dome lamp is 4 cp. (used only in closed bodies).

FUSES.—Fuse is 20 ampere.

CHEVROLET
Model 490 (1922)
Auto-Lite Starter and Generator
Remy Ignition

HANDLEY-KNIGHT

MODEL B (1922) AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM AUTO-LITE IGNITION

BATTERY.—U. S. L., Type HDN-317-X, 6 volt, 162.6 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Breaker contacts separate .025 inch. When the condition of the contacts affects the ignition resurface them with fine sandpaper. Remove all grit.

Oiling.—Fill the oil cup at the side of the distributor with a good grade of light machine oil every 1000 miles, and put 1 drop on the breaker arm bearing every 3000 miles.

Timing.—Breaker contacts begin to separate when the piston entering the power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plug Gaps.—The spark plug gaps are .025 inch.

STARTER.—Model M.H. 1022. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end.

Starter Data—MH.

Torque	R.P.M.	Amperes	Volts
2.0 lb. ft.	1160	110	5.8
6 lb. ft.	700	225	5.3
8 lb. ft.	580	275	5.0
10 lb. ft.	460	325	4.7
12 lb. ft.	375	365	4.4
17.5 lb. ft.	Lock	600	3.5

Oiling.—Put 5 or 6 drops of light engine oil in the starter oilers every two weeks.

GENERATOR.—Model G.K. 1011. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. The maximum charging rate is 13 to 16 amperes, reached at 1200 to 1400 R.P.M. of the armature.

Generator Test Data.—GK.

Amperes	Hot Test	R.P.M.	Amperes	Cold Test	R.P.M.
0.0		420	0		350
4		540	4		420
8		700	8		540
12		1000	12		710
13		1200-1400	16		1200-1400
11		2000	13		2000
9.4		2800	11		2800

Move the third brush in the direction of armature rotation to increase the charging rate, and in the opposite direction to decrease the charging rate.

Oiling.—Put 5 or 6 drops of light engine oil in the generator bearing oilers every week. If the car is driven more than 250 miles in a week, the oiling should be done every 250 miles.

RELAY.—The relay is mounted on the dash. Relay closes when the voltage of the generator reaches 6.5 to 7.5 volts, and opens when there is a discharge current of 0 to 2 amperes. Relay contacts separate .030 to .045 inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted resurface with worn No. 00 sand paper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 15 cp. Dimmer, dash and tail lamps are 6-8 volt, 2 cp.

FUSES.—Fuses are 20 amperes.

PAIGE-DETROIT

MODELS 6-44 AND 6-66 (1922) REMY GENERATING, STARTING, AND LIGHTING SYSTEM ATWATER KENT IGNITION

PAIGE-DETROIT
Models 6-44 and 6-66 (1922)
Remy Starter and Generator
Atwater Kent Ignition
Plate No. 781

BATTERY:—Willard, (15-19 & 17-20) Type SJRN-4 (6-44) Type SJWN-4 (6-66) Type SJRG-4, 6 volt 111 ampere-hour. The positive (+) terminal is grounded

IGNITION:—Type CA. Breaker contacts separate .006 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

Oiling:—Put 5 or 6 drops of light engine oil in each of the starter oilers every month.

Timing:—Breaker contacts begin to separate when the flywheel marking "T.C. 1-6" is 1 1/4 inches past the indicator, spark control lever and breaker assembly in the fully retarded position.

Firing Order:—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps:—Spark plug gaps are .025 inch.

STARTER:—(15-19 & 6-44) No. 721-A (17-20 & 6-66) No. 705-C. The direction of rotation is counter-clockwise, looking at the commutator end. Starter is connected to the engine through a Bendix drive. Starter cranks the engine at 190 R.P.M. taking 160-210 amperes at 5 volts.

Starter Data

Model	Volts	No Load Test		Lock Torque	Torque
		Amperes	R.P.M.	Amperes	
721-A	5	60	6000	3.15	570 16 ft. lbs.
705-C	5	75	3000	3	600 22 ft. lbs.

The brush tension is 1 to 1 1/4 pounds.

Oiling:—Remove the distributor cap every two weeks and put 4 or 5 drops of light engine oil in the oil hole exposed. Put a small amount of vaseline on the cam, applying with a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

GENERATOR:—Model No. 913-E. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system.

Generator Data

Amperes	Gold Test		Hot Test	R.P.M.
	Volts	R.P.M.	Amperes	
7	7.1	825	6-9	1450
19-21	8.3-8.8	1800		
18.5 Max		2500		

The fields draw 4.85 amperes at 6 volts. The brush tension is 14 to 18 ounces. Charging rate is varied by adjusting third brush setting. Third brush is moved by turning a small screw exposed in the commutator end plate. Move the third brush in the direction of armature rotation to increase the charging rate, and in the opposite direction to decrease the charging rate. Reseat the brush after adjusting position.

Oiling:—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY:—Model No. 263-C. Relay is mounted on the dash. Relay closes when the voltage of the generator reaches 7.0 to 7.4 volts and opens when there is a discharge of 0 to 2 amperes. Relay contacts separate .012 to .015 inch. Air gaps between the relay armature and coil core is .012 to .015 inch, contacts closed. Clean Relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS:—Head lamps are 6-8 volt, 17 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp.

FUSES:—Generator field fuse is 5 ampere. Lighting circuit fuse is 20 amperes.

SPECIAL NOTE:—On Model 6-66 the connection is shown by dotted line (—) from ammeter to negative (—) pole of the battery.

Gray and Davis Starter and Generator
Connecticut Ignition
Plate No. 782

LEXINGTON

SERIES 22 (1922)

GRAY & DAVIS GENERATING, STARTING AND LIGHTING SYSTEM CONNECTICUT IGNITION

BATTERY.—Willard, Type SJRN-4, 6 volt, 100 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Coil Model 225Y. Breaker contacts separate .012 to .015 inch. They are made of tungsten. When the condition of the contacts affects the ignition, renew the inner breaker mechanism. For temporary service, resurface contacts with fine emery cloth.

Oiling.—Refill the cup under the breaker head with pure vaseline and turn down every month. If the car is driven more than 1000 miles in a month, this must be done every 1000 miles. Do not put grease or oil in the cup.

Timing.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center. Spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1-5-3-6-2-4.

Spark Plug Gaps.—The spark plug gaps are .020 inch.

STARTER.—Type 534. The direction of rotation is counter-clockwise, looking at the commutator end. Starter is connected to the engine through a Bendix drive. Starter cranks the engine at 140 R.P.M., taking 138 amperes.

Starter Data.

Torque	R.P.M.	Amperes
2 lb. ft.	1600	130
6 lb. ft.	600	280
10 lb. ft.	240	410
12 lb. ft.	125	465
15 lb. ft.	Lock	540

The brush tension is 2 pounds.

Oiling.—Oilless bearings are used. No oil is required.

GENERATOR.—Type 647. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system.

Generator Data.

Hot Test.		Cold Test.	
Amperes	R.P.M.	Amperes	R.P.M.
0	550	0	500
4	780	4	650
8	1200	12	1150
10	1800	15	1800
8	2300	12	2500

The brush tension of all of the brushes is $1\frac{3}{4}$ pounds. The fields draw 2.6 amperes at 6 volts. The charging rate is varied by adjustment of the third brush setting. The third brush adjusting screw extends through the commutator end plate toward the bottom of the generator. Turn the screw in a clockwise direction to increase the charging rate or in the opposite direction to decrease the charging rate. Reseat the brush after the adjustment. The maximum charging rate is 14 amperes, reached at 25-30 M.P.H.

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes when the voltage of the generator reaches 6.5 to 7.5 volts, and opens when there is a discharge current of 0 to 2 amperes. Relay contacts separate .015 to .018 inch. The air gap between the relay armature and coil core is .010 to .012 inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volts, 21 cp., S.C. Dimmer, resistance and dash lamps are lamps are 6-8 volts, 4 cp., D.C. Tail lamp is 6-8 volts, 2 cp., D.C.

FUSES.—Lighting circuit fuses are 15 ampere. Generator fuse is 5 ampere.

COMBINATION SWITCH.—Connecticut No. 186-2-Y.

LEXINGTON

SERIES ST AND T (1921-1922)

GRAY & DAVIS GENERATING, STARTING AND LIGHTING SYSTEM

CONNECTICUT IGNITION

BATTERY.—Willard, Type SJRN-4, 6 volt, 100 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Coil Model MA. Distributor Model No. 17C. Breaker contacts separate .017 to .024 inch. They are made of tungsten. When the condition of the contacts affects the ignition, renew the inner breaker mechanism. For temporary service re-surface contacts with fine emery cloth.

Oiling.—Refill the cup under the breaker head with pure vaseline and turn down every month. If the car is driven more than 1000 miles in a month, thus must be done every 1000 miles. Do not put grease or oil in the cup.

Timing.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—Spark plug gaps are .025 inch.

STARTER.—Type 531. The direction of rotation is counter-clockwise, looking at the commutator end. Starter is connected to the engine through a Bendix drive. Starter normally cranks the engine at 100-125 R.P.M., taking 100 to 160 amperes.

Starter Data.—Type 531.

Torque	R.P.M.	Amperes
2 lb. ft.	1600	130
6 lb. ft.	600	280
10 lb. ft.	250	410
12 lb. ft.	125	465
15 lb. ft.	Lock	540

The brush tension is 2 pounds.

Oiling.—Oilless bearings are used. No oil is required.

GENERATOR.—Type 647. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system.

Generator Data.—Type 647.

Hot Test		Cold Test	
Amperes	R.P.M.	Amperes	R.P.M.
0	550	0	500
4	780	4	650
8	1200	12	1150
10	1800	15	1800
8	2300	12	2500

The fields draw 2.6 amperes at 6 volts.

The charging rate is varied by adjustment of the third brush setting. The third brush adjusting screw extends through the commutator end plate toward the bottom of the generator. Turn the screw in a clockwise direction to increase the charging rate or in the opposite direction to decrease the charging rate. Reseat the brush after the adjustment.

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes when the voltage of the generator reaches 6.5 to 7.5 volts, and opens when there is a discharge current of 0 to 2 amperes. Relay contacts separate .015 to .018 inch. The air gap between the relay armature and the coil core is .010 to .012 inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dash, tail, tonneau, and under-hood lamps are 6-8 volts, 2 cp.

FUSES.—Head light and horn fuses are 15 ampere. Tail light and generator field fuses are 5 ampere.

PATERSON
Model 22-6-52 (1922)
Delco System
Plate No. 784

PATERSON

MODEL 22-6-52 (1922)

7-R CONTINENTAL ENGINE

DELCO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

BATTERY.—Willard, Type SJRN-3, 6 volt, 80 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 2159, Distributor Model No. 5207. Breaker contacts separate .020 to .0275 inch. They are made of tungsten. When the condition of the contacts affects the ignition remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

Oiling.—Put 3 or 4 drops of light engine oil in the oiler at the side of the distributor every 500 miles. Apply a very small amount of light grease or vaseline to the face of the cam every 1000 miles. If the track of the rotor button is not well polished it should receive a very small quantity of vaseline. Pack the distributor housing with light cup grease once each season.

Timing.—Breaker contacts begin to separate when the top dead center mark on the fly-wheel is $1\frac{3}{8}$ inches past the indicator, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—Spark plug gaps are .030 inch.

STARTER.—Model No. 181. The direction of rotation is clockwise, looking at the commutator end. Starter is connected to the engine through a Bendix drive and a set of reduction gears. Running free the starter takes 30-40 amperes at 6 volts. The lock torque is 28 pound feet at 4 volts, the current being 525 amperes. Remove the grease plug in the reduction gear case and inject soft cup grease every six months.

Oiling.—Put 5 or 6 drops of light engine oil in the starter oilers every month.

GENERATOR.—Model No. 165. Rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. Maximum charging rate is 16 amperes reached at 1200 R.P.M. of the armature.

Generator Data.

Amperes	R.P.M.
Neutral	550
4	800
8	1000
11-15	1200
11-14	2000

The charging rate of the generator is adjusted by shifting the third brush by loosening the three screws holding the bearing retainer plate on the commutator end and shift the plate. Move in a counter-clockwise direction to increase the charging rate, or in the opposite direction to decrease the charging rate. Tighten the adjusting screws and reseal the brush after making the adjustment. Maximum charging rate must not exceed 16 amperes.

Oiling.—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted on the generator frame. Relay closes when the voltage of the generator reaches 7.5 volts, and opens when there is a discharge current of 0 to 2 amperes. Relay contacts separate .046 to .062 inches. Air gap between the relay armature and coil core is .020 to .035 inch, contacts closed. To adjust relay connect a voltmeter between the positive (+) generator brush and ground. Then slowly speed up the generator and adjust the relay spring tension by turning the thumb nut until the contacts close when the voltmeter indicates 7.5 volts. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volts, 24 cp. Dimmer lamps are 6-8 volt, 6 cp. Dash and tail lamps are 3-4 volt, 4 cp.

CIRCUIT BREAKER.—A vibrating circuit breaker takes the place of fuses. A current of 25 amperes will start the vibrator, which, while operating, reduces the current to 3-5 amperes.

COMBINATION SWITCH.—Delco No. 1171.

Auto-Lite Starter and Generator
Connecticut Ignition
Plate No. 785

EARL MODEL 40 (1922) AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM CONNECTICUT IGNITION

BATTERY.—U. S. L. Type, HDN, 313X, 6 volts, 95 ampere hour. The positive (+) terminal is grounded.

IGNITION.—Connecticut, Model 16-C. Breaker contacts separate .018 to .020 inch. They are made of tungsten. When the condition of the contacts affects the ignition, renew the inner breaker mechanism. For temporary service, resurface contacts with fine emery cloth.

Oiling.—Refill the cup under the breaker head with pure vaseline and turn down every month. If the car is driven more than 1000 miles in a month, this must be done every 1000 miles. Do not put grease or oil in the cup.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 3, 4, 2.

SPARK PLUG GAPS.—Spark plug gaps are .025 to .030 inch.

STARTER.—Model MG-1013. Starter is connected to engine by a Bendix drive. The direction of rotation is counter-clockwise, looking at commutator end. Motor running free at 4000 R.P.M., taking 40-60 amperes, 6 volts. Cranking engine at 125 R.P.M., requiring 150 amperes, 5 volts. Lock torque 13 pounds-feet, current being 450 amperes, at 3-4 volts.

Starter Data		
Torque	R.P.M.	Amperes
2 lb. ft.	1280	135
4 lb. ft.	900	210
6 lb. ft.	600	275
8 lb. ft.	400	335
10 lb. ft.	180	390
13 lb. ft.	Lock	450

Oiling.—Put 4 or 5 drops of light engine oil in each of the starter bearing oilers every month.

GENERATOR.—Model GJ-1013. Generator current regulation is by third brush system. The direction of rotation is counter-clockwise, looking at the commutator end. The maximum charging rate is 16-18 amperes at 7-7.5 volts.

12.0	3400	10	3400

Hot Test

The above readings are obtained with the generator charging a battery of 1.300 solution. The tension of all of the brushes is 1 1/4 pounds.

Oiling.—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Model CB-1072. Relay closes when the voltage of the generator reaches 6.5 to 7.5 volts and opens when there is a discharge of 0 to 2 amperes. Contacts separate .020 inch. The air gap between the relay armature and coil core is .010 to .025 inch, contacts closed. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

COMBINATION SWITCH.—Briggs and Stratton No. 2367.

LAMPS.—Head lamps are 6-8 volt, 16 cp.. Dash and tail lamps are 6-8 volt 2 cp. Side lamps are 6-8 volt, 4 cp. Stop lamp is 6-8 volt 21 cp.

RICKENBACKER

MODEL "A" (1922)

SIMMS' GENERATING, STARTING AND LIGHTING SYSTEM

AUTO LITE IGNITION—ATWATER KENT COIL

BATTERY.—Prest-O-Lite, Type 613-RHN, 6 volts, 108 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. N-7. Distributor Model No. IG4019. Breaker contacts separate .016 to .020 inch. When the condition of the contacts affects the ignition resurface them with worn No. 00 sandpaper. Remove all grit.

Oiling.—Fill the oil cup at the side of the distributor with a good grade of light machine oil (preferably 3 in 1) each 1000 miles. Put 1 drop of 3 in 1 oil on the breaker arm bearing each 3000 miles.

Timing.—Breaker contacts begin to separate when the mark "O" on the outer edge of the front flywheel is directly in the center, on top; number 1 piston entering the power stroke.

Firing Order.—The firing order is 1, 4, 2, 6, 3, 5.

Spark Plug Gaps.—The spark plug gaps are .022 to .025 inch.

STARTER.—Model T. The starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter cranks the engine at 150-175 R.P.M., taking 140 amperes.

Starter Test Data—Model T.

Torque	R.P.M.	Amperes
1.65 lb. ft.	1400	140
11 to 13 lb. ft.	Lock	500

The brush tension is 2½ to 3 pounds.

Oiling.—Put 3 or 4 drops of light engine oil in the commutator end oiler every 1000 miles.

GENERATOR.—Model R. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulator is by the third brush system. The maximum charging rate is 12 amperes, reached at 1500 R.P.M. of the armature.

Generator Test Data—Model R.

Hot Test		Cold Test	
Amperes	R.P.M.	Amperes	R.P.M.
0	600	0	560
10	1500	12	1500

The brush tension of all of the brushes is 1 to 2 pounds.

The charging rate is varied by adjustment of the third brush setting. To increase the charging rate rotate the small knob which projects through the commutator end plate next to the center bearing in a clockwise direction. Rotating the knob in the opposite direction will decrease the charging rate.

Oiling.—Put 3 or 4 drops of light engine oil in each of the generator oilers every 1000 miles. Do not over oil the generator.

RELAY.—Briggs & Stratton, No. 1441. The relay is mounted on the generator frame. The relay closes when the voltage of the generator reaches 6.5 to 7.5 volts, and opens when there is a discharge current of 0 to 2 amperes. Relay contacts separate .015 to .025 inch. The air gap between the relay armature and coil core is .015 to .040, contacts closed. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dash and tail lamps are 6-8 volt, 2 cp.

FUSES.—Fuses are 20 ampere.

SWITCH.—The combination switch is Briggs & Stratton, No. 2276.

MAXWELL

MODEL 25 (1922)

AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM

ATWATER KENT IGNITION

BATTERY.—Prest-O-Lite, Type 613-WHN, 87.5 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Type CC. On models using C.C. breaker head the contacts separate .008 to .010 inch, while models using type 46 breaker head require .016 to .018 inch opening. The contacts are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

Oiling.—Remove the distributor cap every 1000 miles and put 4 or 5 drops of light engine oil in the oil hole exposed and put a small amount of vaseline on the cam, applying with a tooth pick.

TIMING.—Breaker contacts begin to separate when the top dead center mark on the fly-wheel is $1\frac{1}{4}$ inches past the indicator, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 3, 4, 2.

SPARK PLUG GAPS.—Spark plug gaps are .030 inch.

STARTER.—Model M. G. Starter is connected to the engine through a Bendix drive. Direction of rotation is counter-clockwise looking at the commutator end. Starter cranks the engine at 120-150 R.P.M. taking 110-130 amperes.

Starter Data

Torque	R.P.M.	Amperes
2 lb. ft.	1280	135
6 lb. ft.	600	275
8 lb. ft.	400	335
10 lb. ft.	180	390
12 lb. ft.	Lock	500

Brush tension is 2 pounds.

Oiling.—Put 5 or 6 drops of light engine oil in the starter oilers every month.

GENERATOR.—Model G.J. Generator current regulation is by the third brush system. Direction of rotation is counter-clockwise, looking at the commutator end. Maximum current output is 12 to 16 amperes, reached at 1300 R.P.M. or 25 miles per hour.

Generator Data

Hot Test			Cold Test		
Amperes	R.P.M.	Volts	Amperes	R.P.M.	Volts
0	600	6.9	0	540	6.9
4.6	800	7.4	7.0	800	7.6
8.2	1000	7.8	10.7	1000	8.0
10.4	1200	8.1	13.2	1200	8.4
12.3	1800	8.3	16.0	1800	8.5
11.9	2200	8.2	15.6	2200	8.45

The brush tension is $1\frac{1}{4}$ pounds.

Move the third brush in the direction of armature rotation to increase the charging rate and in the opposite direction to decrease the charging rate. Reseat the brush after adjusting position.

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes when the voltage of the generator reaches 6.5 to 7.5 volts, and opens when there is a discharge current of 0 to 2 amperes. Relay contacts separate .025 inch. Air gap between the relay armature and coil core is .040 inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted resurface them with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting them into service.

LAMPS.—Head lamps are 6-8 volt 21 cp. Dash and tail lamps are 6-8 volt 2 cp.

FUSES.—Fuse is 20 ampere.

MAXWELL

MODEL 25 (1922)

SIMMS-HUFF GENERATING, STARTING AND LIGHTING SYSTEM

ATWATER KENT IGNITION

BATTERY.—Prest-O-Lite, Type 613-WHN, 87.5 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Type CC. On models using CC breaker head the contacts separate .008 to .010 inch, while models using type 46 breaker head require .016 to .018 inch opening. The contacts are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

Oiling.—Remove the distributor cap every 1000 miles and put 4 or 5 drops of light engine oil in the oil hole exposed, and put a small amount of vaseline on the cam, applying with a toothpick.

Timing.—Breaker contacts begin to separate when the top dead center mark on the flywheel is $1\frac{1}{4}$ inches past the indicator, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 3, 4, 2.

SPARK PLUG GAPS.—Spark plug gaps are .030 inch.

STARTER.—Type B. Direction of rotation is counter-clockwise looking at the commutator end. Starter is connected to the engine through a Bendix drive. Starter cranks the engine at 170-200 R.P.M. taking 130-150 amperes.

Starter Data

Torque	R.P.M.	Amperes	Volts
0	4000	50-60	6.0
1.65	1400	140	5.0
13-16	Lock	600	4.1

The brush tension is $2\frac{1}{2}$ to $3\frac{1}{2}$ pounds.

Oiling.—Put 3 or 4 drops of light engine oil in the commutator end oiler every 1000 miles.

GENERATOR.—Type GL. Generator current regulation is by the third brush system. The direction of rotation is counter-clockwise, looking at the commutator end. Maximum charging rate is 14.3 amperes reached at 1500 R.P.M. of the armature, or 21 miles per hour.

Generator Data

Hot Test			Cold Test		
Amperes	R.P.M.	Volts	Amperes	R.P.M.	Volts
0	6.7	600	Cuts in	0	6.7
7	7.8	900	8.8	8.0	900
11.6	8.2	1200	13.2	8.4	1200
12.8	8.3	1500	14.3	8.5	1500
7.8	7.9	2500	10.0	8.1	2500

Move the third brush in the direction of armature rotation to increase the charging rate. The brush tension is 1 to 2 pounds. Shunt field should draw 3 amperes at 6 volts. rate, or in the opposite direction to decrease the charging rate.

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator oilers every 1000 miles.

RELAY.—Relay closes when the voltage of the generator reaches 6.5 to 7.5 volts, and opens when there is a discharge current of 0 to 2 amperes. Relay contacts separate .025 inch. Air gap between the relay armature and coil core is .040 inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt 21 cp. Dash and tail lamps are 6-8 volt 2 cp.

FUSES.—Fuse is 20 ampere.

BOUR-DAVIS

MODEL 20 (1920) AND 21 (1921-22)

WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM

WESTINGHOUSE IGNITION

BATTERY:—Willard, (20) Type SJWN-4, 6 volt, 102.8 ampere hour, (21) Type SJRN-4, 6 volt 118 ampere hour. The positive (+) terminal is grounded.

IGNITION:—Westinghouse, Type SC. Breaker contacts separate .012 to .016 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone. The bumper on the contact spring is $\frac{1}{8}$ inch off center from the line through the centers of the shaft and terminal screw, this offset being opposite to the direction of rotation of the cam. The above adjustment is made by bending the solid arm at the terminal block. A pull of 20 to 25 ounces, applied to the movable contact, is required to separate the contacts .020 inch. The spring pressure is adjusted by bending the solid arm at the point of contact with the contact spring. Resistance of the primary winding of the ignition coil is 1 ohm. The resistance of the ballast resistor is .4 ohm. Resistance of the secondary winding is 3700-4700 ohms.

OILING:—Put 4 or 5 drops of light engine oil in the oiler at the side of the breaker box every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

TIMING:—Breaker contacts begin to separate when the top dead center mark on the flywheel is $\frac{1}{2}$ inch past the indicator, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER:—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS:—Spark plug gaps are .023 to .027 inch.

STARTER:—Frame 711. Starter is connected to engine through a Bendix drive. Torque at 1250 R.P.M. is 2.5 pound-feet. Lock torque is 16 pound-feet, current 525 amperes. The brush tension is $2\frac{1}{2}$ to 3 pounds.

OILING:—Refill starter oil wells with light engine oil every month.

GENERATOR:—Frame No. 760. Generator current regulation is by third brush system. Current output is varied by adjustment of third brush setting. Set the third brush so that at 1100-1500 R.P.M. the maximum current output is 15 to 17 amperes, at $7\frac{1}{2}$ volts. The cold test readings are obtained with the normal setting of third brush, and a generator temperature under 35°C . (95°F .). The hot test readings are obtained after the generator has been operated one hour at 1800 R.P.M., charging a half-charged battery or its equivalent.

Cold Test			Generator Data		Hot Test	
R.P.M.	Generator Output Amperes	Generator Voltage	R.P.M.	Generator Output Amperes	Generator Voltage	
500	0	6.5	1250	12-14	7.5	
750	8	6.5	2500	7-11	6.5-7.5	
1250	15-17	7.5				
2500	7-11	6.5-7.5				

Field current is 2.8 to 3.25 amperes, 6 volts. Field resistance is 1.9 to 2.25 ohms at 25°C . (77°F .).

Field Test, Generator Operating

Cold Test		
R.P.M.	Generator Output Amperes	Generator Voltage
1250	15-17	7.5

Hot Test		
R.P.M.	Generator Output Amperes	Generator Voltage
1250	12-15	7.5

Operating freely as a motor, current flow is 3.5 to 5 amperes, 6 to 6.6 volts.

OILING:—Put 5 or 6 drops of light engine oil in each of generator oilers every two weeks. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.

RELAY:—Relay closes at 8-10 miles per hour or 500-550 R.P.M. of armature, and opens at 6-8 miles per hour, or 450-500 R.P.M. of armature. Charging current is 1 to 2 amperes at closing, and the discharge current 0 to 2 amperes at opening of relay. Air gap between relay armature (moving member) and coil core is .031 inch, contacts separated. Contacts separate .013 to .018 inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS:—Head lamps are 6-8 volt, 21 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash lamp is 6-8 volt 4 cp. Tail lamp is 6-8 volt, 2 cp. On the model 20, head lamps are 6-8 volt, 15 cp. Dash lamp is 6-8 volt, 2 cp.

REMY IGNITION

Plate No. 791

JACKSON

MODEL 6-38 (1920-21-22)

AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM

REMY IGNITION

BATTERY:—(1920-21) Willard, Type SJW-3 (1922) Exide, Type 3-XC-131, 6 volt 90 ampere hour. The negative (—) terminal is grounded.

IGNITION:—Remy. Coil Model No. 284-B. Breaker contacts separate .020 inch. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or well worn No. 00 sandpaper.

Oiling:—Refill the grease cup under the distributor head with soft cup grease and turn down every two weeks. Put a small amount of vaseline on the fiber bumper of the contact arm, applying with a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

Timing:—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly one-third advanced.

Firing Order:—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS:—The spark plug gaps are .025 inch.

STARTER:—Model M.H.-1025. Starter is connected to the engine through a Bendix drive. Starter cranks the engine at 150 R.P.M., taking 250-300 amperes.

Starter Data

Torque	R.P.M.	Amperes
2.0 lb. ft.	1160	110
6 lb. ft.	700	225
10 lb. ft.	460	325
12 lb. ft.	375	365
17.5 lb. ft.	Lock	600

Oiling:—Put 5 or 6 drops of light engine oil in the starter oilers every month.

GENERATOR:—Model GJ-1025-E. Generator current regulation is by the third brush system. Maximum current output is 12-16 amperes reached at 1700 R.P.M. of the armature, or 22 miles per hour.

Generator Data

Amperes	Cold Test	R.P.M.	Amperes	Hot Test	R.P.M.
0	500	0	580		
8	750	6	840		
12	960	9	1050		
16	1400	12	1360		
16.5	1700	12.7	1700		
12	3400	10	3400		

Above readings are obtained with generator charging a battery of 1.300 solution.

Oiling:—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY:—Relay closes at 6-10 miles per hour or 500-600 R. P. M. of the generator armature and opens at 300-400 R.P. M. of the armature or 6-8 miles per hour. Relay contacts separate .030 to .045 inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS:—Head lamps are 6-8 volt, 21 cp. Dimmer lamps are 6-8 volt, 2 cp. Dash and tail lamps are 6-8 volt, 2 cp. On the 1920-21 cars, head lamps are 6-8 volt, 17 cp. Dimmer lamps are 6-8 volt, 4 cp.

FUSE:—Lighting circuit fuse is 20 ampere.

PIERCE-ARROW
Series 33 (1923)
Delco System

Plate No. 792

PIERCE-ARROW

SERIES 33 (1923)

DELCO GENERATING, STARTING AND LIGHTING SYSTEM

DELCO IGNITION

BATTERY.—Willard, Type SJRN-6, 6 volts, 162.5 ampere hours. The positive (+) terminal is grounded.

IGNITION.—Coil Model No. 2171. Distributor Model No. 5216. A dual battery ignition system is provided. Breaker contacts separate .020 to .0275 inches. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with a hard oilstone, No. 53 (medium) India.

Oiling.—Put 8 to 10 drops of light engine oil in each distributor unit oilers every 500 miles. If rotor buttons and their tracks are not well polished, apply a small amount of vaseline with a soft cloth. If the car is driven more than 1000 miles a month, these attentions must be given every 1000 miles. Repack distributor driving gear compartment with 8 ounces of medium soft cup grease once a year.

Timing.—Breaker points begin to separate when the mark "Ignition" on the flywheel is 1 1/4 inches past top dead center, spark control lever and breaker assembly in fully retarded position. Exhaust breaker opens 3° to 7° ahead of intake breaker, measured on the flywheel.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—Spark plug gaps are .030 inches.

STARTER.—Model No. 191-252. Rotation looking at commutator end is clockwise. Cranks the engine at 115 R.P.M., taking 180 to 300 amperes current. Running free the starter takes 42 to 45 amperes at 5000 R.P.M. Locked, the current is 550 to 600 amperes.

Oiling.—Put 8 to 10 drops of light engine oil in the starter oiler every 500 miles.

GENERATOR.—Model No. 238. Rotation, looking at commutator end, is counter-clockwise. Current regulation is by the third brush system combined with a vibrating voltage regulator. The maximum charging rate is 20 amperes, reached at 1400 R.P.M. of armature or 25 miles per hour of the car in high gear. Tension of all brushes is 20 to 28 ounces.

Generator Test Data

Amperes	Hot Test	R.P.M.	Amperes	Cold Test	R.P.M.
3 min.		600	5 min.		600
8 min.		800	10 min.		800
16-18		1200	18-20		1200
16-18		1600	18-20		1600
17		2400	19		2400

Note.—These readings do not take into account the 4 amperes taken for ignition and which do not show on ammeter on dash.

Oiling.—Put 5 or 6 drops of light engine oil in each of the two generator oilers every 500 miles.

RELAY REGULATOR.—Model No. 5513. The relay and regulator are combined into one unit, mounted on the forward side of the dash. The relay closes at 8 miles per hour or 475 R.P.M. of the armature. The air gap between coil core and the relay armature is .025 to .035 inch, contacts closed. Adjust the spring tension of the relay so that it closes at 6.5 volts. Clean relay and regulator (vibrator), disconnect the battery and connect a voltmeter between the generator "A" terminal and the frame. Vary the vibrator spring tension until the maximum voltage of the generator at any speed is 8.5 volts. Clean relay and regulator contacts, if slightly dirty, with well worn No. 00 sandpaper, but if the points are badly burned, disassemble points at pivot point and resurface with a No. 53 (medium) India oilstone. Be careful that there is no grit or oil on the points when assembled again. If points are stoned, readjustment of gap will be necessary.

LAMPS.—Head lamps are 6-8 volts, 21 cp. Dimmer lamps are 6-8 volts, 4 cp. Dash and tail lamps are each 6-8 volts, 4 cp. Tail, dome and tonneau lamps are 6-8 volts, 4 cp. All lamps have single contact base.

FUSES.—Main circuit fuse is 30 amperes. Lighting circuit fuses are 10 amperes.

Delco System

Plate No. 793

NASH

MODELS 691 TO 698 INCLUSIVE (1923) DELCO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

BATTERY.—Willard, Type SJRN-4, 6 volt, 111 ampere hour. The positive (+) terminal is grounded.

IGNITION.—Coil Model No. 2178. Distributor Model No. 5244. Breaker contacts separate .020 to .0275 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface lightly on an oilstone.

Oiling.—Put 3 or 4 drops of light engine oil in the distributor oiler every 500 miles. If the track of the rotor button is not well polished, apply a very small amount of vaseline. Put a very small amount of soft vaseline on the face of the breaker cam every 1000 miles.

Timing.—Breaker contacts begin to separate when the piston entering the power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position. To time engine, loosen advance lever clamp screw and shift distributor cup in a counter-clockwise direction until breaker contacts begin to separate. Tighten clamp screw after making the adjustment. Make certain that the rotor is under the

STARTER.—Model No. 230. Starter is connected to the engine through a set of reduction gears meshed by the operator. An overrunning clutch prevents the starter armature from being driven at excessive speed by the engine flywheel after the engine has started running under its own power. The direction of rotation is clockwise, looking at the commutator end. The lock torque is 21 to 23 pound-feet at 4 volts, the current being 500 amperes. The brush tension is 2¼ pounds.

Oiling.—Put 4 or 5 drops of light engine oil in each of the two starter oilers each month. Remove the grease plug in the side of the reduction gear housing and repack the housing with medium cup grease once or twice each season. Every 2000 miles withdraw the starter from the engine and saturate the wick under the oiler on the outward bearing of the splined shaft with light engine oil.

GENERATOR.—Model 229. The direction of rotation is clockwise looking at commutator end. Generator current regulation is by the third brush system. Generator is belt driven, and care must be taken that the belt is not tight enough to cause undue wear to the armature bearings and should be so loose that the generator armature will rotate when the ignition switch is "On" with the engine stopped. To adjust the belt tension, loosen the clamp screws holding the generator to the engine and shift the position of the generator slightly.

Generator Data.

Amperes	R.P.M.
Neutral	650
4	800
8	1000
12-16	1600
8-12	2300

The charging rate is varied by adjustment of the third brush setting. Remove the cover band, loosen the two adjusting screws attaching the third brush arm to the mounting plate. Move the third brush in the direction of armature rotation to increase the charging rate, or in the opposite direction to decrease the charging rate. Tighten the adjusting screws and be sure that all of the brushes are well seated. Maximum charging rate should not exceed 17 amperes (lights off, generator hot) in any case.

Oiling.—Put 8 or 10 drops of light engine oil in each of the generator bearings every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks.

RELAY.—There is no relay. The circuit between the generator and the battery is controlled by the ignition switch.

LAMPS.—Head lamps are 6-8 volts, 21 cp. Dimmers are 6-8 volts, 4 cp. Side lamps are 6-8 volts, 2 cp. Dash and tail lamps are 6-8 volts, 2 cp. Tonneau lamp is 6-8 volt, 2 cp.

CIRCUIT BREAKER.—A vibrating circuit breaker takes the place of fuses. A current of 25 amperes will cause this device to vibrate. While vibrating the current is 10-15 amperes.

DELCO GENERATING, STARTING AND LIGHTING SYSTEM

DELCO IGNITION

BATTERY:—Exide, Model 3-XXV-19-2, 6 volts, 19 plate, 120 ampere hour. The positive (+) terminal is grounded.

IGNITION:—Coil Model No. 2115. Distributor Model No. 5250. Breaker contacts separate .015-.0225 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a hard oilstone.

Oiling:—Put 8 or 10 drops of light engine oil into each distributor oiler every two weeks. If car is driven over 500 miles in two weeks, these attentions must be given every 500 miles.

Timing:—Breaker contacts begin to separate when the piston entering the power stroke is on top dead center, spark control lever one-half advanced.

Firing Order:—The firing order is 1R, 4L, 3R, 2L, 4R, 1L, 2R, 3L.

Spark Plug Gaps:—The spark plug gaps are .020 to .025 inch.

STARTER:—Model No. 248. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Running free the starter takes 50 amperes at 6 volts. Lock torque is 12 lb. ft. at 2.75 volts. The pressure of the starter brushes on the commutator should be 2¼ to 2¾ pounds.

Oiling:—Put 8 or 10 drops of light engine oil into oiler on commutator end of motor each 500 miles or every two weeks. Saturate the large cotton wick in the oiler on the Bendix drive end of motor each 2000 miles.

GENERATOR:—Model No. 247. Generator current regulation is by the third brush system. The armature is driven at one and one-half times engine speed. Generator charges battery at approximately 8 miles per hour in high gear, or at correspondingly lower speed in low gear. Maximum output is reached at 18 to 25 M.P.H. At higher speed charging rate decreases. Looking at commutator end, the direction of rotation is counter-clockwise.

Generator Test Data

Amperes	R.P.M.
5	800
13-15	1500
15-17 Max.	2000

To adjust the generator output, loosen the commutator cover band and the two screws holding the third brush arm mounting bracket. Then shift the third brush in the direction of armature rotation (counter-clockwise) to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the two screws after making the adjustment. The pressure of the generator brushes on the commutator should be 1¼ to 1¾ pounds.

Oiling:—Put 8 to 10 drops of light engine oil into generator oilers every two weeks. If car is driven more than 500 miles in two weeks, these attentions must be given each 500 miles.

RELAY:—There is no relay. The current between the generator and the battery is controlled by the ignition switch.

LAMPS:—Head lamps are 6-8 volts, 21 cp. Side lamps and dome lamps are 6-8 volts, 4 cp. Tail and dash lamps are 3-4 volts, 2 cp. Signal lamp is 6-8 volts, 21 cp.

FUSES:—A vibrating circuit breaker takes the place of fuses. A current of 25 to 30 amperes will operate vibrator, and will continue to vibrate with a current flow not exceeding 15 amperes. A lockout breaker is located in the dome, stop, and handy lamp circuits and in the horn circuit. A current of 25-30 amperes causes it to open the circuit.

KISSEL
MODEL C-B-6, SERIES 45 (1922)
REMY GENERATING, STARTING AND LIGHTING SYSTEM
REMY IGNITION

BATTERY.—Willard, Type SJR-5, 6 volt, 139 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Model 284-A. Distributor Model No. 626-B. Breaker contacts separate .023 inch. They are made of tungsten. When condition affects ignition, resurface on a hard oilstone.

Oiling.—Turn grease cup two turns and fill oil cup on driving end every two weeks. If car is driven over 500 miles in two weeks, this attention must be given every 500 miles.

Timing.—Breaker contacts begin to separate when the top dead center mark on fly-wheel is $1\frac{1}{4}$ inch past the indicator, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—The spark plug gaps are .025 inch.

STARTER.—Model 720-D. The direction of rotation, looking at commutator end, is counter-clockwise. Cranking engine at 100-150 R.P.M., it takes 150 to 200 amperes. Starter is connected to engine through a Bendix drive.

Starter Data

Torque
15 lbs Min.

Amperes
570 amperes Max.

The brush tension on commutator is 16 to 20 ounces.

Oiling.—Put 5 or 6 drops of light engine oil into starter oilers every month. If car is driven over 1000 miles per month, these attentions must be given every 1000 miles.

GENERATOR.—Model No. 912-B. Direction of rotation, looking at commutator end, is counter-clockwise. Current regulation is by the third brush system combined with a thermostat located in the shunt field circuit. With thermostat contacts open generator output is cut down approximately 50%. To adjust generator output, loosen direction of armature rotation to increase the charging rate and in the opposite direction to decrease the charging rate.

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0.....	7.0.....	675			
7.....	7.2.....	750	11.....	8.2.....	1900
20.....	8.5.....	1800			

Shunt field current is 5 amperes at 6 volts. Generator brush tension should be 16 ounces each.

Oiling.—Put 5 or 6 drops of light engine oil into generator oilers every two weeks. If car is driven over 500 miles in two weeks, these attentions must be given each 500 miles.

RELAY.—Model No. 264-C. Contacts separate .012 to .015 inch. Air gap between relay contacts and coil core is .012 to .015 inch, contacts closed. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volts, 21 cp. Dimmer lamps are 6-8 volts, 12 cp. Side lamps are 6-8 volts, 4 cp. Tail lamp is 6-8 volts, 2 cp. Dome lamp is 6-8volts, 6 cp.

FUSES.—All fuses are 20 ampere.

KISSEL
Series 55 (1923)
Remy System

Plate No. 797

KISSEL SERIES 55 (1923) REMY GENERATING, STARTING AND LIGHTING SYSTEM REMY IGNITION

BATTERY.—Willard, Type SJR-4. 6 volt, 110 ampere hour. The positive (+) terminal is grounded.

IGNITION.—Model 284-A. Distributor Model No. 626-B. Breaker contacts separate .023 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a hard oilstone. The manual advance is 20°. Automatic advance is 20°.

Oiling.—Turn grease cup two turns and fill oil cup on driving end every two weeks. If car is driven over 500 miles in two weeks, this attention must be given every 500 miles.

Timing.—Breaker contacts begin to separate when the top dead center mark on fly-wheel is 1¼ inch past the indicator, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—The spark plug gaps are .030 inch.

STARTER.—Model 720-D. The direction of rotation, looking at commutator end, is counter-clockwise. Cranking engine at 100-150 R.P.M. it takes 150 to 200 amperes. Starter is connected to engine through a Bendix drive.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5000	5	65
15 lb. ft.	Lock	3.15	570

Starter brush tension should be 20-28 ounces each.

Oiling.—Put 5 or 6 drops of light engine oil into starter oilers every month. If car is driven over 1000 miles per month, these attentions must be given every 1000 miles.

GENERATOR.—Model No. 912-B. Direction of rotation, looking at commutator end, is counter-clockwise. Current or voltage regulation is by the third brush and thermostat system. The maximum charging rate is 19-21 amperes, reached at 1800 R.P.M. of armature.

Generator Test Data

Amperes	Hot Test	R.P.M.	Amperes	Cold Test	R.P.M.
10-13		1800	19-21		1800
			15-18.5		2500

Brush tension is 14 to 18 ounces on all brushes.

Oiling.—Put 5 or 6 drops of light engine oil into generator oilers every two weeks. If car is driven over 500 miles in two weeks, these attentions must be given each 500 miles.

RELAY.—Model No. 264-C. Contacts separate .012 to .015 inch. Air gap between relay contacts and coil core is .012 to .015 inch, contacts closed. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volts, 21 cp. Dimmer lamps are 6-8 volts, 4 cp. Dash lamp is 6-8 volt, 2 cp. Tail lamp is 6-8 volts, 6 cp. Dome lamp is 6-8 volts, 6 cp.

FUSES.—All fuses are 20 ampere.

HAYNES

MODEL 57 (1923)

LEECE-NEVILLE GENERATING, STARTING AND LIGHTING SYSTEM

KINGSTON IGNITION

BATTERY.—Prest-O-Lite, Type 615-SHC, 6-8 volts, 125 ampere-hours. The positive (+) terminal is grounded.

IGNITION.—Coil Model No. 68. Distributor Model No. 42. Breaker contacts separate .020 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a hard oilstone.

Oiling.—Put 5 or 6 drops of light engine oil into distributor oilers every two weeks. If car is driven over 500 miles in two weeks, these attentions must be given once every 500 miles.

Timing.—Breaker contacts just opens when piston No. 1 is slightly past top center on power stroke, when marking "Inlet Open" on flywheel indicator, and spark control lever and breaker assembly is fully retarded.

Firing Order.—The firing order is 1, 4, 2, 6, 3, 5.

Spark Plug Gaps.—Spark plug gaps separate .025 inch.

STARTER.—Model No. 448-M. The direction is rotation, looking at commutator end, is clockwise. Cranks the engine at 1100 R.P.M., requiring 300 amperes.

Starter Test Data

Torque	R.P.M.	Amperes
2 ft. lbs.	2050	150
4 ft. lbs.	1350	240
6 ft. lbs.	920	330
8 ft. lbs.	700	390
20 ft. lbs.	0 (Stalled)	750

Brush tension on all brushes is $2\frac{1}{2}$ to 3 lbs.

Oiling.—No oiling is required for this starter.

GENERATOR.—Model No. 474-G. The direction of rotation looking at commutator end is counter-clockwise. The third brush system is used to regulate the current. The maximum charging rate is 15 amperes, reached at 1200 R.P.M. of armature.

Generator Test Data

Amperes	Hot Test	R.P.M.	Amperes	Cold Test	R.P.M.
0		430	0		430
5		620	5		550
10		800	10		660
15		1200	15		840
12		1800	18		1200
			15		1600

Brush tension—Main brushes, 2 to $2\frac{1}{2}$ lbs. Third brush—2 lbs.

Oiling.—Put 5 or 6 drops of light engine oil into generator oilers every two weeks. If car is driven over 500 miles in two weeks, these attentions must be given every 500 miles.

RELAY.—Leece-Neville, Model No. 13-CC-6. Relay closes at 7 miles per hour, or 450 R.P.M. of armature, and opens at 7 miles per hour. Relay contacts separate $\frac{1}{16}$ inch, air gap between regulator, armature and coil core is $\frac{1}{64}$ inch, when contacts are closed.

LAMPS.—Head lamps are 6-8 volts, 21 cp. Dimmer lamps are 6-8 volts, 6 cp. Dash lamps are 6-8 volts, 2 cp. Tail lamps are 6-8 volts, 2 cp. Stop light, 6-8 volt, 21 cp.

FUSES.—Only one generator field fuse used in car.

CLEVELAND
Model 42 (1923)
Bosch Generating, Starting and Lighting System
Bosch Magneto Ignition
Plate No. 799

CLEVELAND

MODEL 42 (1923)

BOSCH GENERATING, STARTING AND LIGHTING SYSTEM BOSCH MAGNETO IGNITION

BATTERY.—Prest-O-Lite, Type 611-RHN, 6 volt, 94 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Type AT-6. Breaker contacts separate .014 to .016 inch. They are made of platinum. When the condition of the contacts affects the ignition, resurface them with a fine flat jeweler's file.

Oiling.—Put 3 or 4 drops of light machine oil in the oil cup at the side of the distributor housing every 500 miles. Care must be taken not to over oil the magneto.

Timing.—Breaker contacts begin to separate when the flywheel marking "DC 1&6" has $1\frac{1}{8}$ inches to travel before reaching the mark on the hole in the flywheel housing. spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—The spark plug gaps are .021 inch.

STARTER.—Model No. 900. Direction of rotation is counter-clockwise, looking at the commutator end. Starter is connected to the engine through a Bendix drive. Starter cranks the engine at 110 R.P.M., taking 150 amperes. Running free, the current is 45-50 amperes.

Starter Data.—No. 900

Torque	R.P.M.	Amperes
2 lb. ft.	1600	130
6 lb. ft.	600	280
10 lb. ft.	250	410
12 lb. ft.	125	465
15 lb. ft.	Lock	540

The pressure of the brushes on the commutator is 2 pounds.

Oiling.—Oilless bearings are used. No oil is required.

GENERATOR.—Model No. 1021. The direction of rotation is counter-clockwise looking at the commutator end. Generator current regulation is by the third brush system. The maximum charging rate is 15 amperes, reached at 1600 R.P.M. of the armature, or 37 miles per hour.

Generator Data.—Model 1021

Amperes	Hot Test	R.P.M.	Amperes	Cold Test	R.P.M.
0		550	0		500
4		760	4		640
8		1100	8		1100
10		1600	15		1600
8		2280	12		2240

The pressure of all of the brushes on the commutator is $1\frac{3}{4}$ pounds.

Oiling.—Put 4 or 5 drops of light engine oil in the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted on the generator frame. Relay closes when the voltage reaches 6.5 to 7.5 volts, and opens when there is a discharge current of 0.2 amperes. The contacts separate .012 to .015 inch. The air gap between the coil core and the relay armature is .018 inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with worn No. 000 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dash, tail and tonneau lamps are 6-8 volt, 2 cp. Side lamps are 6-8 volt, 4 cp.

FUSES.—Lighting fuse is 20 ampere. Generator fuse is 5 ampere.

DANIELS

MODELS 23-32 AND 23-38 (1923) DELCO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

BATTERY.—Willard Type SJRN-5, 6 volts, 125 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 2127. Distributor Model No. 5212. Breaker contacts separate .018 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel finishing on a hard oilstone.

Oiling.—Put 4 or 5 drops of light engine oil in the upper ball bearing every two weeks. If the track of the rotor in the distributor head is not well polished, apply a small amount of vaseline with a soft cloth. Clean out and repack the distributor housing with soft cup grease every six months. This housing contains the automatic advance and retard mechanism.

Timing.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly one-third advanced.

Firing Order.—The firing order is 1L, 2R, 3L, 1R, 4L, 3R, 2L, 4R.

Spark Plugs.—Diameter $\frac{7}{8}$ inch. Spark gaps are .031 inch.

STARTER.—Model No. 170. Starter is connected to the engine through a set of reduction gears meshed by the operator. The raising and lowering of the two grounded starter brushes serves as a starting switch. Lock torque is 27 lb. ft. at 2.75 volts. The starter running free takes 60 amperes at 6 volts. The direction of rotation is clockwise, looking at the commutator end. The tension of each of the starter brushes should be from $2\frac{1}{4}$ to $2\frac{3}{4}$ pounds.

Oiling.—Put 8 or 10 drops of light engine oil in each of the starter bearing oilers every 1000 miles or each month. Saturate the wick in the oiler at starter gear end of motor once each year. Remove grease plug and repack reduction gear housing with medium heavy cup grease once every six months. Disassemble motor clutch once each year and after cleaning it, repack with vaseline.

GENERATOR.—Model No. 169. Generator current regulation is by the third brush system. The direction of rotation is counter-clockwise, looking at the commutator end. The maximum charging rate is 20-22 amperes, reached at 1450 R.P.M. of the armature or approximately 20 M.P.H. To adjust the charging rate, loosen the three screws in the bearing retainer plate on the end of the generator and shift the third brush. Moving the third brush in the direction of rotation (counter-clockwise) increases the charging rate and in the opposite direction decreases the charging rate. After making the adjustment tighten the three screws.

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted on the generator frame. Relay closes at 8 miles per hour or 500-550 R.P.M. of the armature, and opens at 6 miles per hour or 450-500 R.P.M. of the armature. Relay contacts separate .046 to .062 inch. Air gap between relay armature (moving member) and coil core is .040 inch, contacts closed. To adjust relay, connect a voltmeter between the positive generator brush and ground. Then slowly speed up the generator and adjust the relay spring tension until the relay contacts close when the voltmeter indicates 7.5 volts. Clean the relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp. Dome lamp is 6-8 volt, 2 cp.

CIRCUIT BREAKER.—A vibrating circuit breaker takes the place of fuses. It requires 25 amperes to start the vibrator. While vibrating the current is 10-15 amperes.

LEXINGTON

SERIES 23 (1923)

GRAY & DAVIS GENERATING, STARTING AND LIGHTING SYSTEM CONNECTICUT IGNITION

BATTERY.—Willard, Type SJRN-4, 6 volt, 100 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Coil Model 225Y. Breaker contacts separate .012 to .015 inch. They are made of tungsten. When the condition of the contacts affects the ignition, renew the inner breaker mechanism. For temporary service, resurface contacts with fine emery cloth.

Oiling.—Refill the cup under the breaker head with pure vaseline and turn down every month. If the car is driven more than 1000 miles in a month, this must be done every 1000 miles. Do not put grease or oil in the cup.

Timing.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center. Spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1-5-3-6-2-4.

Spark Plug Gaps.—The spark plug gaps are .020 inch.

STARTER.—Type 532-534. The direction of rotation is counter-clockwise, looking at commutator end. Starter is connected to engine through a Bendix drive. Starter cranks the engine at 140 R.P.M., taking 138 amperes.

Starter Data.

Torque	R.P.M.	Amperes
2 lb. ft.	1600	130
6 lb. ft.	600	280
10 lb. ft.	240	410
12 lb. ft.	125	465
15 lb. ft.	Lock	540

The brush tension is 2 pounds.

Oiling.—Oilless bearings are used. No oil is required.

GENERATOR.—Type 647-650. The direction of rotation is counter-clockwise, looking at commutator end. Generator current regulation is by the third brush system.

Generator Data.

Hot Test.		Cold Test.	
Amperes	R.P.M.	Amperes	R.P.M.
0	550	0	500
4	780	4	650
8	1200	12	1150
10	1800	15	1800
8	2300	12	2500

The brush tension of all of the brushes is 1 3/4 pounds. The fields draw 2.6 amperes at 6 volts. The charging rate is varied by adjustment of the third brush setting. The third brush adjusting screw extends through the commutator end plate toward the bottom of the generator. Turn the screw in a clockwise direction to increase the charging rate or in the opposite direction to decrease the charging rate. Reseat the brush after the adjustment. The maximum charging rate is 14 amperes, reached at 25-30 M.P.H.

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes when the voltage of the generator reaches 6.5 to 7.5 volts, and opens when there is a discharge current of 0 to 2 amperes. Relay contacts separate .015 to .018 inch. The air gap between the relay armature and coil core is .010 to .012 inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volts, 21 cp., S.C. Dimmer, resistance and dash lamps are lamps are 6-8 volts, 4 cp., D.C. Tail lamp is 6-8 volts, 2 cp., D.C.

FUSES.—Lighting circuit fuses are 15 ampere. Generator fuse is 5 ampere.

COMBINATION SWITCH.—Connecticut No. 186-2-Y.

KLINE KAR

MODEL 6-60. SERIES L (1923)

WAGNER GENERATING, STARTING AND LIGHTING SYSTEM CONNECTICUT IGNITION

BATTERY.—Prest-O-Lite, Type 613-RHN, 6 volt, 100 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Coil Model 225-Y. Distributor Model No. 16. Breaker contacts separate .020 to .022 inch. They are made of tungsten. When the condition of the contacts affects the ignition, renew the inner breaker mechanism. For temporary service, resurface contacts with fine emery cloth.

Oiling.—Refill the cup under the breaker head with pure vaseline and turn down every month. If the car is driven more than 1000 miles in a month, this must be done every 1000 miles. Do not put grease or oil in the cup.

Timing.—Breaker contacts begin to separate when piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plugs.—Diameter, $\frac{7}{8}$ inch. Spark gaps are .022 inch.

STARTER.—Model EM-320, 36-T. The direction of rotation is clockwise, looking at the commutator end. Starter is connected to the engine through a Bendix drive. Starter cranks the engine at 100 R.P.M., taking 200 amperes. Lock torque is 11.5 pound-feet, current being 475 amperes. The brush tension is 1200 grams.

Oiling.—Put 5 or 6 drops of light engine oil in each of the starter oilers every month.

GENERATOR.—Model EM-305, 45-W. The direction of rotation is clockwise, looking at the commutator end. Generator current regulation is by the third brush system. Maximum current output is 16 amperes, reached at 1400 R.P.M. of the armature or 20-24 miles per hour. The tension of all of the brushes is 450 grams.

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Model K-44. Relay closes at 5 miles per hour and opens at 3 miles per hour. Charging current is 2 amperes at closing, and the discharge current 0-4 amperes at the opening of relay contacts. Contacts separate .035 to .065 inch. Air gap between relay armature and coil core is .025 inch, contacts closed. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6 volt, 21 cp. Dash and tail lamps are 6 volt, 2 cp.

FUSES.—Head-lamp fuse is 15 ampere. Horn fuse is 10 ampere. Tail lamp fuse is 5 ampere.

Plate No. 803.

LIBERTY

MODEL 10-D (1923)

WAGNER GENERATING, STARTING AND LIGHTING SYSTEM WAGNER IGNITION

BATTERY.—Prest-O-Lite, Type SCH-613, 6 volt, 115 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. K-32. Distributor Model KC-335. Breaker contacts separate .024 to .029 inch. When the condition of the contacts affects the ignition, renew the lever arm and contact screw.

OILING.—Screw up the grease cup under the breaker head one-half turn every two weeks. If the car is driven more than 500 miles in two weeks, this must be done every 500 miles. Put 3 or 4 drops of light engine oil on the wick in the breaker lever spindle every 6 months.

TIMING.—Breaker contacts begin to separate when piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 4, 2, 6, 3, 5.

SPARK PLUG GAPS.—Spark plug gaps are .025 inch.

STARTER.—Model E.M.-266, Type 36-T. Starter is connected to the engine through a Bendix drive. Starter cranks the engine at 115 R.P.M., current being 160 amperes. Lock torque is 11.5 pound-feet, current 475 amperes. Running freely, starter current is 60-90 amperes, armature revolving at 8000 R.P.M.

OILING.—Put 5 or 6 drops of light engine oil in each of the starter oilers every month.

GENERATOR.—Model E.M.-277, Type 45-W. Generator current regulation is by third brush system. Maximum current output is 15-17 amperes, reached at 20-23 miles per hour or 1600 R.P.M. of armature. Charging rate reduces to 8 amperes at 40 miles per hour or 3200 R.P.M.

OILING.—Put 5 or 6 drops of light engine oil in each generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Model I-471. Relay closes at 8-10 miles per hour or 660-750 R.P.M. of the armature, and opens at 6-8 miles per hour or 450-660 R.P.M. of the armature. Charging current is 2 amperes at closing, and the discharge current is 0-4 amperes at opening of relay contacts. Contacts separate .035 to .065 inch. Air gap between relay armature (moving member) and coil core is .025 inch, contacts closed. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dash and tail lamps are 6-8 volt, 2 cp.

Plate No. 804

CLIMBER

MODEL T & K (1923) SERIAL NO. 2000-3000 WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM ATWATER KENT IGNITION

BATTERY.—Battery is 6 volt, 120 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Type CC. Breaker contacts separate .006 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING.—Remove the distributor cap and put 4 or 5 drops of light engine oil in the exposed oil hole every two weeks. Put a small amount of vaseline on the cam, applying with a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is a top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 3, 4, 2.

SPARK PLUGS.—Diameter $\frac{7}{8}$ inch. Spark plugs are .030 inch.

STARTER.—Frame No. 100. Starter is connected to the engine through a Bendix drive. Starter cranks the engine at 130 R.P.M., taking 250-300 amperes.

Starter Data			
Torque	R.P.M.	Amperes	Volts
0 lb. ft.	4100-7000	35-45	5.5
1.75 lb. ft.	1600	145	5.5
12 lb. ft.	Lock	475	4.0

Pressure of brushes on the commutator is $1\frac{1}{4}$ to $1\frac{1}{2}$ pounds.

OILING.—Put 5 or 6 drops of light engine oil in the starter oilers every month.

GENERATOR.—Frame No. 765. Generator current regulation is by third brush system. Maximum current output is 15-17 amperes at 900-1400 R.P.M. of the armature or 20-25 miles per hour.

Amperes	Generator Data	R.P.M.
0		375
8		550
15-17		900-1400
7-11		2500
11-13	Hot Test	1200

Field winding takes 3.25 to 3.75 amperes at 6 to 6.3 volts. Running freely as a motor, generator takes 6 amperes at 6 to 6.3 volts. Charging rate is varied by adjustment of the third brush setting.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 375-425 R.P.M. of the armature or 8-10 miles per hour and opens at 350-375 R.P.M. of the armature or 6-8 miles per hour. Adjust relay spring tension so that contacts open with a discharge current of 0-3 amperes from the battery. Adjust armature stop (which determines the air gap between the relay armature and coil core) so that the contacts close when the voltage of the generator reaches 6.2 to 6.5 volts. Contacts separate .030 to .035 inch. Air gap between relay armature and coil core is .005 inch, contacts closed. Resistance of the shunt winding is 68 ohms. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 20 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 4 cp. Tail lamp has single contact base. All others have double contact base.

Auto-Lite Generating, Starting and Lighting Systems
Connecticut Ignition
Plate No. 805

OVERLAND

MODEL 4 (1922)

AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM CONNECTICUT IGNITION

BATTERY.—U. S. L., CDN-311-X, 6 volts, 84 ampere-hours. Starting capacity—96 amperes for 20 minutes. Lighting capacity—5 amperes for 17 hours. The negative (—) terminal is grounded.

IGNITION.—Connecticut Battery Ignition. Breaker contacts separate .018 inch. If condition of contact points affects ignition, remove and resurface on a hard oilstone.

Oiling.—Fill grease cup with vaseline every month. If the car is driven more than 1000 miles per month, this attention must be given each 1000 miles.

Timing.—Breaker contacts just open when piston No. 1 is on top dead center of compression stroke, spark control lever and breaker assembly fully retarded.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plugs.—Spark plug diameter, 1/2 inch, gaps separate .030 inch.

STARTER.—Model MG. The direction of rotation is counter-clockwise, looking at commutator end. The connection to the motor is by a Bendix drive. Running free at 4000 R.P.M. of armature, current is 40-60 amperes at 6 volts. Cranking engine at 125 R.P.M., it takes 150 amperes at 5 volts. Lock torque is 18 pound-feet, 3-4 volts, 600-650 amperes.

Oiling.—Put 5 or 6 drops of light engine oil into starter oilers every two weeks. If car is driven over 500 miles in two weeks, this care must be given every 500 miles.

GENERATOR.—Model GP. The direction of rotation looking at commutator end is counter-clockwise. Generator motoring freely takes 4 to 5 amperes, 6 volts. Field test current is 2.2 amperes, 6 volts. Each coil separately, 8.8 amperes, 6 volts. The third brush system is employed for current regulation.

Generator Test Data

Amperes	R.P.M.	M.P.H.
0	325	
Max. 15	1100-1300	20-25
10-11	2500-3000	

Oiling.—Put 5 or 6 drops of light engine oil into generator oilers every week or 250 miles.

RELAY.—Relay closes at 325 to 375 R.P.M. of armature or 7 to 9 M.P.H., 7-8 volts, and opens at 275 to 325 R.P.M. of armature or 5 to 7 M.P.H. 1-2 ampere discharge. Air gap between relay armature and core is .010 to .015 inch, contacts closed. Contact gap separates .025 to .035 inch.

LIGHTING.—Head lamps 6-8 volts, 21 cp., S.C. Tail and dash lamps, 3-4 volts, 2 cp., S.C.

OVERLAND

MODEL 91 (1923)

AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM

AUTO-LITE IGNITION

BATTERY.—U. S. L. Type CDN-311-X. 6 volt. The starting capacity is 96 amperes for 20 minutes. The lighting capacity is 5 amperes for 17 hours. The negative (—) terminal is grounded.

IGNITION.—Coil Model IG-4035. Distributor Model IG-4036A. Breaker contacts separate .018 inch, contacts fully separated. If condition of contact points affects ignition, remove and resurface on a hard oilstone.

Oiling.—Put 4 or 5 drops of light engine oil into the distributor oiler each week. If the car is driven over 250 miles in a week, this must be done each 250 miles.

Timing.—Breaker contacts just open when top dead center mark on flywheel is 2½ inches before reaching dead top center indicator, on compression stroke, spark control lever and breaker assembly fully advanced.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plugs.—Spark plug diameters are ½ inch. Gaps are .025 inch.

STARTER.—Model MG-1001. The direction of rotation looking at commutator end is counter-clockwise, looking at the commutator end. Starter is connected to the engine through a Bendix drive.

Starter Data.

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	4000	6	60
.6 lb. ft.	2700	5.5	100
2.9 lb. ft.	1500	5	200
5.5 lb. ft.	850	4.5	300
8.2 lb. ft.	410	4	400
17.5 lb. ft.	Lock	4	600

Oiling.—Put 7 or 8 drops of light engine oil into oil filler hole of the starting motor every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles. Keep drive end bearing well lubricated.

GENERATOR.—Model GP-4003A. The direction of rotation of the armature looking at commutator end, is counter-clockwise. The third brush system is employed for current regulation. Move third brush in counter-clockwise direction to increase the output and in the opposite direction to decrease the output. The maximum charging rate is 10-11 amperes (generator hot) reached at 1500 R.P.M. of the generator armature or approximately 20-25 miles per hour.

Generator Test Data

Cold Test. (77°F.)			Hot Test. (167°F.)		
Amperes.	Volts.	R.P.M.	Amperes.	Volts.	R.P.M.
0	7	375	0	6.5	475
4	7.2	500	4	6.8	640
8	7.4	650	7	7.4	800
12	7.8	875	10	7.6	1200
15	7.9	1225	10.6	7.8	1540
16	8	1600	8.2	7.8	2400
13	7.8	2400			

Motoring freely generator draws 4-5 amperes at 6 volts. The shunt field current is 2.2 amperes at 6 volts. Each coil tested separately draws 8.8 amperes at 6 volts.

Oiling.—Put 8 or 10 drops of light engine oil into the generator oilers each week. If the car is driven more than 250 miles in a week, this oiling must be done each 250 miles.

RELAY.—Model CB-1078. Relay closes at 325-375 R.P.M. or 7-9 M.P.H. at 7-8 volts and opens at 275-325 R.P.M. of armature, or 5-7 M.P.H. 1-2 ampere discharge. Contact gaps separate .025 to .035. Core gap is .010-.015 inch, contacts closed.

LAMPS.—Head lamps, 6-8 volts, 21 cp., S.C. Dimmer resistance employed. Tail and dash lamps, each 3-4 volts, 2 cp., S.C.

FUSES.—One 20 ampere fuse is used.

SCRIPPS-BOOTH

SERIES "F" (1921)

REMY GENERATING, STARTING AND LIGHTING SYSTEM

REMY IGNITION

SCRIPPS-BOOTH
Series "F" (1921)
Remo Systems
Plate No. 807

BATTERY.—Prest-O-Lite, Type 613-RHN, 6 volts, 100 ampere-hours capacity. Starting capacity—115 amperes for 20 minutes, lighting capacity—5 amperes for 20 hours. The negative (—) terminal is grounded.

IGNITION.—Breaker contacts separate .022 inch. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Refill the grease cup under the breaker head with soft cup grease and turn down two turns every two weeks. Put a small amount of vaseline on the fiber bumper of the contact arm, applying with a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when the top dead center mark on the fly-wheel is $\frac{1}{2}$ inch past the indicator, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .025 to .030 inch.

STARTER.—Model No. 701-A. Starter is connected to the engine through a Bendix drive.

Starter Data			
Torque	R.P.M.	Amperes	Volts
0 lb. ft.	10,000	65	5.7
2 lb. ft.	2250	175	5.1
6 lb. ft.	750	365	4.2
10 lb. ft.	225	500	3.5
12 lb. ft.	Lock	575	3.2

Above tests are made without gear reduction. Pressure of brushes on the commutator is 20-24 ounces.

OILING.—Put 5 or 6 drops of light engine oil in each of the starter oilers every month.

GENERATOR.—Model 911-A. Generator current regulation is by the third brush system. A thermostat, located in the brush rigging of the generator, cuts a resistance into the shunt field circuit of the generator at a temperature of 175°F., reducing maximum charging rate 8 amperes. Never touch the thermostat points. Maximum charging rate is 20 amperes with the thermostat closed, reached at 1800 R.P.M. of the armature or 25 miles per hour.

Generator Data			
Cold Test. Thermostat Closed	R.P.M.	Hot Test. Thermostat Open	R.P.M.
Amperes		Amperes	
0	600	0	800
5	750	4	1100
10	950	6	1250
14	3200	9	3200
15	1200	8	1450
20	1800	11	2000

Charging rate is varied by adjustment of the third brush setting. Third brush assembly is moved by turning a screw exposed in the commutator end plate. Pressure of main brushes on the commutator is 17-20 ounces. Pressure of the third brush is 13-17 ounces.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 8-10 miles per hour or 600-650 R.P.M. of the armature and opens at 6-8 miles per hour or 550-600 R.P.M. of the armature. Relay contacts separate .020 inch. Air gap between relay armature and coil core is .020 inch, contacts closed. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 18 cp. Dash and tail lamps are 6-8 volt, 2 cp.

HAYNES
Models 50 (1921) and 55 (1922)
Leece-Neville Generating, Starting and Lighting System
Kingston Ignition
Plate No. 808

HAYNES

MODELS 50 (1921) AND 55 (1922)

LEECE-NEVILLE GENERATING, STARTING AND LIGHTING SYSTEM KINGSTON IGNITION

BATTERY.—Prest-O-Lite, Type 615-S. H. C. for 1922. Willard, Type SJRN-5 for 1921. 6 volts, 132 ampere-hour. Starting capacity—135 amperes for 20 minutes. Lighting capacity—5 amperes for 20 hours. The positive (+) terminal is grounded.

IGNITION.—Kingston Battery Ignition. Breaker contacts separate .018 inch. If condition affects ignition, remove and resurface on a hard oilstone.

Timing.—Breaker contacts begin to open when piston No. 1 is slightly past top dead center on power stroke, setting "Inlet Open" on flywheel at indicator mark. Spark control lever and breaker assembly fully retarded.

Firing Order.—The firing order is 1, 4, 2, 6, 3, 5.

Spark Plug Gaps.—Spark plug gaps are .025 inch.

Oiling.—Put 5 or 6 drops of light engine oil into distributor oiler every 500 miles.

STARTER.—Model No. 388-M. The direction of rotation is counter-clockwise, looking at commutator end. Starter cranks the engine at 1100 R.P.M. of armature at 42° F., taking 400 amperes at 4 volts. Motor running freely takes 60 amperes at 6 volts. The lock torque is 15 pound-feet, current being 675 amperes at 3.2 volts.

Starter Test Data

Torque	R.P.M.	Torque	R.P.M.
1 lb. ft.	2200	165	5.2
5 lb. ft.	840	330	4.3
10 lb. ft.	245	540	3.4
15 lb. ft.	0	675	3.2

The brush tension is 3 pounds.

Oiling.—No oil is necessary, as oilless bearings are used.

GENERATOR.—Model No. 454-G. The direction of rotation is counter-clockwise, looking at commutator end. The third brush system is used for current regulation. The maximum charging rate is 18 amperes (cold) reached at 1200 R.P.M. The main brush tension is 2½ pounds, and the third brush tension is 2 pounds.

Generator Test Data

Amperes	Hot Test	R.P.M.	Amperes	Cold Test	R.P.M.
0		430	0		430
10		800	14.5		800
15		1200	18		1200
13		1600	15		1600

Oiling.—Place a few drops of light engine oil in each generator oiler once every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

RELAY.—Model No. 13-CC-6. Closes at 450-500 R.P.M., 8-10 M.P.H., 6.5 volts; opens at 400-450 R.P.M., 6-7 M.P.H., 0-2 amperes discharge. Relay contacts separate .047 inch. Air gap between relay armature and coil core is .063 inch, contacts closed.

LAMPS.—Head lamps, 6-8 volts, 21 cp. Auxiliary lights, 6-8 volts, 6 cp. Dash and tail lamps, 6-8 volts, 2 cp.

FUSES.—Generator field fuse is 5 amperes.

CIRCUIT BREAKER.—A circuit breaker is used instead of fuses in the lighting and ignition circuits.

WILLYS-KNIGHT

MODEL 20-AA (1922)

AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM

AUTO-LITE IGNITION

BATTERY—U. S. L., Type HDN-317-X, 6 volts, 166 ampere hours. Starting capacity—170 amperes for 20 minutes. Lighting capacity—5 amperes for 33 hours. The negative (—) terminal is grounded.

IGNITION—Auto-Lite Battery Ignition. Breaker contacts separate .018 inch. If condition of contact points affects the ignition, remove and resurface on a hard oilstone.

Timing—Breaker contacts begin to open when piston No. 1 is at top dead center, on compression stroke, spark control lever and breaker fully retarded.

Oiling—Put 4 or 5 drops of light engine oil into timer distributor each week. If the car is driven over 250 miles in a week, this care must be given every 250 miles.

Firing Order—The firing order is 1, 3, 4, 2.

Spark Plug Gaps—The spark plug gaps are .020 to .025 inch.

STARTER—Model MH. The direction of rotation looking at commutator end is counter-clockwise. The starter is connected to engine by a Bendix drive. Motor running free at 4000 R.P.M., takes 40-60 amperes, at 6 volts, cranking engine at 100 to 200 R.P.M., takes 250-300 amperes at 5 volts. Lock torque is 17.5 pound feet, current being 600 amperes at 3-4 volts.

Oiling—Pour 7 or 8 drops of light engine oil into starter oiler every two weeks. If car is driven over 500 miles in two weeks, this attention must be given every 500 miles. Keep drive end bearing well lubricated.

GENERATOR—Model GJ. The direction of rotation, looking at commutator end, is counter-clockwise. The third brush system is used for voltage regulation. Motoring freely, takes 4 to 5 amperes, 6 volts. Field test current is 2.2 amperes at 6 volts. Each coil separately, current is 8.8 amperes at 6 volts.

Amperes		R.P.M.		M.P.H.
	0		500	
Max. 16			1750-2000	20-25
	10-11		3000-3500	

Oiling—Pour 7 or 8 drops of light engine oil each week. If car is driven over 250 miles a week this attention must be given every 250 miles.

RELAY—Relay closes at 7-9 M.P.H., 500-550 R.P.M., 7-8 volts, and opens at 5-7 M.P.H. 450-500 R.P.M., 1-2 ampere discharge. Contacts separate .025-.035 inch; and air gap between relay armature and coil core is .010-.015 inch, contacts closed.

LIGHTING—Head lamps are 6-8 volts, 21 cp., S.C. Dash and tail lamps, 3-4 volts, 2 cp., S.C.

FUSES—Two 15 ampere fuse used.

Plate No. 810

WILLYS-KNIGHT

MODEL 64-67 (1923)

AUTO LITE GENERATING, STARTING AND LIGHTING SYSTEM AUTO-LITE IGNITION

BATTERY—U. S. L., Type HDN-317-X, 6 volts, 166 ampere hours. Starting capacity—170 amperes for 20 minutes. Lighting capacity—5 amperes for 33 hours. The negative (—) terminal is grounded.

IGNITION—Coil Model 4035. Distributor Model IG-4036B. Breaker contacts separate .018 inch contacts fully separated. If condition affects ignition, remove and re-surface on a hard oilstone.

Oiling—Put 4 or 5 drops of light engine oil into timer distributor each week. If the car is driven over 250 miles in a week, this care must be given every 250 miles.

Timing—Breaker contacts just open when flywheel is 12° late on compression stroke, spark control lever and breaker assembly fully retarded.

Firing Order—The firing order is 1, 3, 4, 2.

Spark Plugs—Spark plugs, diameter 7/8 inch. Gap, .025 inch.

STARTER—Model MH-4002. Direction of rotation looking at commutator end is counter-clockwise. The starter is connected to engine by a Bendix drive. Motor running free at 4000 R.P.M., takes 40-60 amperes, at 6 volts, cranking engine at 100 to 200 R.P.M., takes 250-300 amperes at 5 volts. Lock torque is 17.5 pound feet, current being 600 amperes at 3.4 volts.

Oiling—Pour 7 or 8 drops of light engine oil into starter oiler every two weeks. If car is driven over 500 miles in two weeks, this attention must be given every 500 miles. Keep drive end bearing well lubricated.

GENERATOR—Model GJ-4010A. The direction of rotation looking at commutator end is counter-clockwise. The third brush system is used for voltage regulation. Move third brush in counter-clockwise direction to increase the output, and to decrease, in the opposite direction. The maximum charging rate is 12-13 amperes (generator hot) reached at 1700 R.P.M. of the generator armature or approximately 20-25 M. P. H.

Generator Test Data

Cold Test. (77°F.)			Hot Test. (167°F.)		
Amperes	Volts.	R.P.M.	Amperes.	Volts.	R.P.M.
0	6.8	500	0	6.8	600
4	7.	580	4	7.3	740
8	7.6	650	8	7.8	950
12	8.	950	11	8.	1200
16.5	8.4	1700	12.7	8.2	1700
15	8.3	2400	11.6	8.1	2400
12.6	8.2	3200			

Motoring freely the generator takes 4-5 amperes at 6 volts. The shunt field current is 2.2 amperes at 6 volts. Each coil tested separately draws 8.8 amperes at 6 volts.

Oiling—Pour 7 or 8 drops of light engine oil into generator oiler once a week. If car is driven more than 250 miles in a week, this care must be given each 250 miles.

RELAY—Relay closes at 7-9 M.P.H., 500-550 R.P.M., 7-8 volts, and opens at 5-7 M.P.H. 450-500 R.P.M., 1-2 ampere discharge. Contacts separate .025-.035 inch; and air gap between relay armature and coil core is .010-.015 inch, contacts closed.

LIGHTING—Clum Combination Ignition and Lighting Switch is used. Head lamps are 6-8 volts, 21 cp., S.C. Dimmer resistance employed. Tail and dash lamps are 3-4 volts, 2 cp., S.C.

FUSES—Fuses are 20 amperes.

FORD
Model T (1923)
Ford-Liberty System

Plate No. 811

FORD MODEL T (1923) LIBERTY GENERATING, STARTING AND LIGHTING SYSTEM FORD IGNITION

BATTERY.—Ford, Exide, U. S. L., or Prest-O-Lite, 6 volt, 80 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—The magneto is carried in the flywheel housing. There should be a clearance of .031 inch, between the coil cores and the magnet pole pieces. The magneto delivers alternating current to four vibrator ignition coils, one connected to each spark plug, as the timer closes the circuit in the proper sequence. When the vibrator arm is held down, the contacts should separate .030 inch. If the contacts are badly burned or pitted, resurface with a fine, flat jeweler's file or on a medium hard oilstone. Coils should be adjusted to draw 1.3 amperes at 6 volts.

Oiling.—Put several drops of light engine oil in the spring oiler of the timer every two weeks. In cold weather a mixture of 1/4 kerosene and 3/4 light engine oil should be used.

Timing.—Timer roller should just make connection with segment connected to Number 1 coil when the piston in Number 1 cylinder is on top dead center of the power stroke, spark control lever and timer housing in the fully retarded position.

Firing Order.—The firing order is 1, 2, 4, 3.

Spark Plug Gaps.—The spark plug gaps are .030 to .032 inch.

STARTER.—Type F.A. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter cranks the engine at 150 R.P.M., taking 160 amperes at 5 volts.

Starter Data.—F.A.

Torque	R.P.M.	Volts	Amperes
1 lb. ft.	2500	5.5	125
5 lb. ft.	1050	4.4	330
9 lb. ft.	425	3.6	465
13 lb. ft.	Lock	3.0	580

Oiling.—Starter requires no oiling.

GENERATOR.—Type F.A. Generator current regulation is by the third brush system. Direction of rotation is counter-clockwise, looking at the commutator end.

Generator Data.—F.A.

Amperes	Volts	R.P.M.
4.1	6.6	800
9.0	7.4	1100
11.5	7.9	1400
12.5	8.2	1700
11.0	8.1	2000

Charging rate is varied by adjustment of the third brush setting. Loosen the clamp nut holding the third brush holder. Move third brush in the direction of armature rotation to increase the charging rate, or in the opposite direction to decrease the charging rate. Clamp the third brush after position adjustment. The generator fields draw 2.4 amperes at 6 volts.

Oiling.—Put 4 or 5 drops of light engine oil in the rear generator bearing oiler every two weeks. If the car is driven more than 500 miles in 2 weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted on the generator frame. Relay closes at 600-650 R.P.M. of armature or 8-10 miles per hour, and opens at 550-600 R.P.M. of armature or 6-8 miles per hour, the discharge current being 0-2 amperes. Relay contacts separate .032 inch. If badly burned or pitted resurface with worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dimmer and tail lamps are 6-8 volt, 2 cp.

GARDNER

SERIES 5 (1923)

WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM

WESTINGHOUSE IGNITION

BATTERY.—Willard, Type SJRN-3, ending on Car No. 24,295-B, SW-4 used, beginning on Car No. 24,296-B. The positive (+) terminal is grounded.

IGNITION.—Type S. C. Coil Model No. 288,761. Distributor Model No. 290,356. Breaker contacts separate .008 to .012 inch. They are made of tungsten. When the pitting of the contacts affects the ignition, remove and resurface with a medium oil-stone. The bumper of the contact spring is $\frac{1}{8}$ inch off center from the line through the center of the shaft and terminal screw, this offset being opposite to the direction of rotation of the cam. The above adjustment is made by bending the solid arm at the terminal block. A pull of 20 to 25 ounces, applied to the movable contacts, is required to separate the contacts .020 inch. This spring pressure is adjusted by bending the solid arm at the point of contact with the contact spring. Resistance of the primary winding and ballast of the ignition coil is 1 ohm. Resistance of the secondary winding is 3700-4700 ohms.

Oiling.—Put 4 or 5 drops of light engine oil in the oiler at the side of the breaker box every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Timing.—Breaker contacts begin to separate when the piston entering power stroke is 20° after top dead center, spark control lever and breaker assembly in the fully retarded position. Advance, 30° before top dead center.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plug Gaps.—Spark plug gaps are .025 inch.

STARTER.—Frame Number 100. Style No. 297,903. Rotation of starter armature, looking at commutator end, is counter-clockwise. Starter is connected to engine through a Bendix drive. Starter cranks engine at 115 R.P.M., developing a torque of 2.2 lb. ft.

Starter Test Data			
Torque	R.P.M.	Volts	Amperes
0 lb. ft.	4100-4700	5.5	35-45
12 lb. ft.	0	4.0	475

Brush tension should be $1\frac{1}{4}$ to $1\frac{1}{2}$ pounds.

Oiling.—Put 5 or 6 drops of light engine oil in each of the starter oilers every month.

GENERATOR.—Frame No. 35-AT. Model 331,328. The direction of rotation, looking at commutator end, is counter-clockwise. Generator current regulation is by the third brush system. Maximum current output is 17 amperes, reached at 1500 R.P.M. of armature. Brush tension at $1\frac{1}{4}$ to $1\frac{1}{2}$ pounds per brush.

Generator Test Data			
Cold Test		Hot Test	
Amperes	Volts	Amperes	Volts
0	6.5	10	8.0
8	8.0		
15-16	8.0		
	500		1200
	750		
	1600		

To increase the charging rate, shift the third brush in the direction of armature rotation and to decrease charging rate shift the brush in the opposite direction.

Oiling.—Put 5 or 6 drops of light engine oil in the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Westinghouse Model 301,210-A. Relay is mounted on generator frame. Relay closes at 500 R.P.M. of the armature or at 0 to 2 amperes. Relay contacts separate .030 inch to .035 inch. Adjust air gap between relay armature and coil core to .005 inch, contacts closed.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dash and tail lamps are 6-8 volt, 2 cp.

FUSES.—Generator fuse is 5 ampere. Lighting circuit fuses are 20 ampere.

LAFAYETTE MODEL 134 (1923) DELCO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

BATTERY.—Exide, Type 3-LXRV-15-2, 6 volt, 130 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Coil Model No.2115. Distributor Model No. 5221. Breaker contacts separate .018 inch. Both sets of contacts open at the same instant. They are made of tungsten. When the condition of the points affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

Oiling.—Put several drops of light engine oil in timer bearing every two weeks. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.

Timing.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever advanced one-third.

Firing Order.—The cylinders are numbered from front to rear as follows (viewed from the driver's seat): Left hand bank—1, 7, 3, 5; right hand bank—4, 2, 6, 8. The firing order is 1, 2, 3, 4, 5, 6, 7, 8.

Spark Plug Gaps.—Spark plug diameters are $\frac{7}{8}$ inch. Gaps are .025 inch.

STARTER-GENERATOR.—Model No. 187. Starter and generator are combined into one unit but are electrically separate. The starter is connected to the engine by a set of reduction gears and a pinion shifted by the operator. Two overrunning clutches are provided. Depressing the starting pedal opens the generator circuit, meshes the reduction gears and allows the motor brushes to come in contact with the commutator, closing the starter circuit and cranking the engine. When the pedal is released, a spring reverses these operations. Lock torque is 10 pound-feet at 3 volts. The motor running free takes 60 amperes at 6 volts. The brush tension of the motor brushes should be $2\frac{1}{4}$ to $2\frac{3}{4}$ pounds each.

GENERATOR.—Generator current regulation is by the third brush system. Thermostat opens at 195-200° F., cutting in a resistance, reducing the charging rate about 50 per cent. The maximum charging rate of 18 amperes is reached at 1400 R.P.M. of the armature or 35 M.P.H., car speed in high gear.

Amperes	Motor-Generator Data. No. 187	R.P.M.
Neutral		400
6		800
10-12		1000
18		1400

When generator is operating freely as a motor, with overrunning clutch as the only retarding force, the current is 5.5 amperes. To increase the charging rate, move the third brush in the direction of armature rotation. To decrease charging rate, move the third brush in the opposite direction. Reseat the brush after adjusting the position. The tension of the generator brushes should be $1\frac{1}{2}$ to $1\frac{3}{4}$ pounds each.

Oiling.—Put 4 or 5 drops of light engine oil in each of the starter-generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—There is no relay. The circuit between the generator and the battery is controlled by the ignition switch.

LAMPS.—Head lamps are 6-8 volts, 21 cp. Side lamps are 6-8 volts, 4 cp. Dash and tail lamps are 3-4 volts, 2 cp. Tonneau lamp is 6-8 volts, 2 cp.

CIRCUIT BREAKERS.—There is a vibrating breaker in the circuit to the head, side, dash and tail lamps, which takes the place of fuses. It requires a current of 25 amperes to start this device vibrating, but when vibrating a current of 3 to 5 amperes will cause it to continue. There is a lockout circuit breaker in the circuit to the horn, tonneau lamp and handy lamp socket. A current of 25 amperes will cause this device to open the circuit.

**MODEL 34-B (1923)
DELCO GENERATING, STARTING AND LIGHTING SYSTEM
DELCO IGNITION**

Plate No. 814

BATTERY.—Prest-O-Lite, Type 617-SHC, 6 volts, 170 ampere-hours. The positive (+) terminal is grounded.

IGNITION.—Coil Model No. 2135. Circuit Breaker Model No. 5742. Distributor contacts separate .020-.0275 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth, and finish on a medium hard oilstone.

Oiling.—Put 4 or 5 drops of light engine oil in the oiler at the side of the distributor unit every two weeks. If the track of the rotor button is not well polished apply a small amount of vaseline with a soft cloth. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles. Pack the distributor housing with soft cup grease to the level of the distributor gears once each year.

Timing.—Breaker contacts begin to separate when the flywheel mark "1 & 6TC" is exactly opposite the indicator, spark control lever 4 to 5 inches advanced from the fully retarded position.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—Spark plug gaps are .022 to .027 inch.

STARTER.—Model No. 172. Starter is connected to the engine through a Bendix drive. Current during the cranking operation is 100 to 300 amperes. Pressure of brushes on the commutator is 2 1/4 pounds. Running free, the starter takes 50 amperes at 6 volts. Stall torque is 18 pound-feet, the current being 450 amperes at 4 volts. The direction of rotation is counter-clockwise, viewed from the commutator end.

Oiling.—Put 4 or 5 drops of light engine oil in each of the starter oilers every month.

GENERATOR.—Model No. 168. Generator current regulation is by third brush system. The direction of rotation is clockwise, viewed from the commutator end. The maximum charging rate is 14 to 16 amperes, reached at 1000 R. P. M.

Amperes	Hot Test	R.P.M.
0.0		285
9.5		500
14.0		1000
12.5		1400
10.0		2000

To vary the charging rate first loosen the clamp nut on the front end of the generator one or two turns. Then turn the third brush adjusting screw in a clockwise direction to increase the charging rate and in a counter-clockwise direction to decrease the charging rate. Tighten the clamp nut and reset the brush after adjusting position. The tension of all the brushes is 1 to 1 1/2 pounds.

Oiling.—Put 4 or 5 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted on generator frame. Relay closes at 500 R.P.M. of armature or 8-9 miles per hour, and opens at 300 R.P.M. or 6-7 miles per hour. Relay contacts separate .046 to .062 inch. Air gap between relay armature (moving member) and coil core is .020 to .035 inch, contacts closed. To adjust relay, connect a voltmeter between the negative generator brush and ground. Then slowly speed up the generator and adjust the relay spring tension until the relay contacts close when the voltmeter indicates 7 1/2 volts. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volts, 21 cp. Dimmer lamps are 6-8 volts, 4 cp. Dash tail lamps are 6-8 volt, 2 cp.

CIRCUIT BREAKERS.—A vibrating circuit breaker takes the place of fuses in the head, dimmer, tail and dash lamp circuits. It requires a current of 25 amperes to start this device vibrating. While vibrating the current is 3-5 amperes. A locking circuit breaker takes the place of fuses in the horn, tonneau, and trouble lamp circuits. A current of 25 amperes will cause this device to open the circuit. The circuit breaker is model No. 5742.

PACKARD SINGLE SIX
ATWATER KENT MOTOR AND GEN., DELCO IGNITION
Plate No. 815

PACKARD

SINGLE SIX (1923)

ATWATER KENT GENERATING, STARTING AND LIGHTING SYSTEM

DELCO IGNITION

BATTERY.—Willard, Type SJRG, 6 volt, 111 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Coil Model No. 2175. Distributor Model No. 5248. Breaker contacts separate .015 to .020 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone. Both sets of contacts must separate at the same instant. Ignition consumes approximately 6 amperes of which is not indicated on ammeter.

Oiling.—Put 4 or 5 drops of light engine oil in the distributor oiler every month, or 1000 miles. Remove distributor head, wipe clean with cloth, apply small quantity of gun oil and wipe with a clean cloth, and apply a minute quantity of vaseline to the cam. This must be done every 2500 miles.

Timing.—Breaker contacts begin to separate when the marking on the flywheel, "Upper D.C. Cylinder 1 and 6," has 1 9/16 inch to travel before reaching center line of motor, spark control lever and breaker assembly in fully advanced position.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—The spark plug gaps are .030 inch.

Fuelizer Plug Gap.—The fuelizer plug gap is 1/8 inch.

STARTER.—Model 6484. Starter is connected to engine through a Bendix drive. Starter cranks the engine at 150 R.P.M., taking 175 amperes at 5 volts. Lock torque is 16 pound-feet, current being 500 amperes at 4 volts.

Oiling.—Put 5 or 6 drops of light engine oil in the two starter oilers each month. If the car is driven more than 1000 miles in a month, these attentions must be given every 1000 miles.

GENERATOR.—Model 5870. Generator current regulation is by the third brush system. maximum charging rate in 9-11 amperes on ammeter, reached at approximately 20 miles per hour. To adjust charging rate, loosen stud which holds the third brush in place, and loosen screw on outside end of generator. Move third brush in a counter-clockwise direction, looking at commutator end, to increase the charging rate; move in a clockwise direction to decrease the charging rate. Tighten both screws.

Oiling.—Put 5 or 6 drops of light engine oil in the generator oiler once each month. If the car is driven more than 1000 miles in a month, this oiling must be done every 1000 miles.

RELAY.—Relay is mounted on the generator frame. Relay closes at 8 to 10 miles per hour and opens at 6 to 8 miles per hour. Relay contacts separate .018 to .020 inch. The air gap between the coil core and the relay armature is .034 to .040 inch. Clean relay contacts by drawing unglazed paper between them. If badly worn or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 7 volts, 21 cp. Dimmer lamps are 7 volts, 4 cp. Dash and tail lamps are 7 volts, 2 cp. Dome lamps used on closed bodies are 7 volts, 6 cp. All lamps are of the single contact type.

CIRCUIT BREAKER.—A vibrating circuit breaker takes the place of fuses. It requires 25 amperes to start the vibrator, but 3-5 amperes will cause it to continue.

Plate No. 816

HANSON MODEL 54 (1923) DELCO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION 7-R CONTINENTAL ENGINE

BATTERY.—Prest-O-Lite, Type 613-RHN, 6 volt, 100 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 2159. Distributor Model No. 5207. Breaker contacts separate .018 inch. They are made of platinum. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oilstone.

OILING.—Put 3 or 4 drops of light engine oil in the ignition unit oilers every two weeks. If the track of the rotor button in the distributor head is not well polished, apply a small amount of vaseline with a soft cloth. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when the top dead center mark on the fly-wheel is $1\frac{3}{8}$ inches past the indicator, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .030 inch.

STARTER.—Model No. 164 or 181. Starter is connected to the engine through a Bendix drive. The direction of rotation is clockwise, looking at the commutator end. Running free the starter takes 36 amperes at 6 volts. Lock torque is 27 lb. ft. at 2.75 volts. The brush tension should be $2\frac{1}{4}$ to $2\frac{3}{4}$ pounds on each brush.

Oiling.—Put 8 or 10 drops of light engine oil in each of the starter oilers every month or each 1000 miles. Remove the grease plug and refill the reduction gear housing with medium soft cup grease every six months. Saturate the wick in the oiler on the end of the Bendix gear with light engine oil once a year.

GENERATOR.—Model No. 165. Rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. Maximum charging rate is 11-15 amperes, reached at 1200 R.P.M. of the armature, or 16-20 miles per hour.

Amperes	Generator Data	R.P.M.
Neutral		550
4		800
8		1000
11-15		1200
11-14		2000

Charging rate is varied by adjustment of the third brush setting. To move the third brush, loosen the three screws holding the bearing retainer plate on the commutator end and shift the plate. Move in a counter-clockwise direction to increase the charging rate, or in the opposite direction to decrease the charging rate. Tighten the adjusting screws and reseal the brush after making the adjustment. Maximum charging rate must not exceed 16 amperes.

OILING.—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted on the generator frame. Relay closes at 550-600 R.P.M. of the armature or 7-8 miles per hour, and opens at 500-550 R.P.M. of the armature or 5-6 miles per hour. Relay contacts separate .046 to .062 inch. Air gap between relay armature and coil core is .020 to .035 inch, contacts closed. To adjust relay, connect a voltmeter between the positive (+) generator brush and the ground. Then slowly speed up the generator and adjust the relay spring tension by turning the thumb nut, until the contacts close when the voltmeter indicates 7.5 volts. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp.

CIRCUIT BREAKER.—A vibrating circuit breaker takes the place of fuses. It requires 25 amperes to start the vibrator, but 3-5 amperes will cause it to continue.

CADILLAC

MODEL 61 (1923)

DELCO GENERATING, STARTING AND LIGHTING SYSTEM

DELCO IGNITION

BATTERY.—Exide, Type 3-LXRV-15-2, 6 volt, 130 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Ignition Coil Model No. 2115. Distributor Model No. 5239. Breaker contacts separate .020 inch for new cars; or for a new set of contact arms, and set contact gaps to .015-.018 inch for cars having been driven over 2000 miles on the set of contact arms. They are made of tungsten. If the condition affects ignition, remove and resurface on a medium hard oilstone.

Oiling.—Remove the breather pipe at the rear of the distributor housing and pack the gear compartment with soft cup grease every 2000 miles.

Timing.—Breaker contacts begin to separate when piston on compression stroke is $1 \frac{21}{32}$ inches in advance of top center, spark control lever and breaker assembly in the fully advanced position.

Firing Order.—The firing order is 1L, 2R, 3L, 1R, 4L, 3R, 2L, 4R.

Spark Plug Gaps.—Spark plug gaps are .023 inch.

STARTER-GENERATOR.—Model No. 98. The direction of rotation is counter-clockwise, viewed from the starter commutator end. The starter cranks the engine at 90-100 R.P.M., taking 140-150 amperes. The starter is connected to the engine through a set of reduction gears meshed by the operator. Lock torque is 6 lb. ft. at 3 volts. Running free the starter takes 70 amperes at 6 volts. The tension of the starter brushes should be $2 \frac{1}{4}$ to $2 \frac{3}{4}$ pounds each.

GENERATOR.—Generator current regulation is by the third brush system. The direction of rotation is clockwise, viewed from the generator commutator end.

Amperes	Generator Data.—M.G. 98	R.P.M.
0		420
2		500
15		1000
17-19		1500
13-17		2000

To adjust the charging rate, loosen the generator cover band and the two screws holding the third brush mounting arm. Shift the third brush in the direction of armature rotation (clockwise) to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screws after making the adjustment. The field current is 2.5 amperes at 6 volts. The tension of each of the generator brushes should be $1 \frac{1}{4}$ - $1 \frac{3}{4}$ pounds.

Oiling.—Put 8 or 10 drops of light engine oil in each of the motor-generator oilers every two weeks or each 500 miles. Once each year remove and clear the motor and generator clutches and repack with vaseline.

RELAY.—There is no relay. The circuit between the generator and battery is controlled by the ignition switch.

LAMPS.—Head lamps are 6-8 volts, 21 cp. Dimmer and side lamps are 6-8 volts, 4 cp. Dash and tail lamps are in series and are 3-4 volts, 2 cp. Tonneau lamps are 6-8 volts, 2 cp.

CIRCUIT-BREAKER.—A vibrating circuit-breaker takes the place of fuses. It requires 25 amperes to start the vibrator but 10-15 amperes will cause it to continue. A lock-out circuit breaker protects the horn, backing lamp and signal lamp circuits. A current of 25-30 amperes causes it to open the circuit.

JACKSON
MODEL 6-38
AUTO-LITE STARTER & GENERATOR
REMY IGNITION

Plate N . 818

JACKSON MODEL 6-38 (1923) AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM REMY IGNITION

BATTERY.—Exide, Type 3-XC-13-1, 6 volt, 90 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Remy. Coil Model No. 284-B. Breaker contacts separate .020 inch. When the condition of the contacts affects the ignition, resurface with a fine flat jeweler's file or well worn No. 00 sandpaper.

Oiling.—Refill the grease cup under the distributor head with soft cup grease and turn down every two weeks. Put a small amount of vaseline on the fiber bumper of the contact arm, applying with a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

Timing.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly one-third advanced.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—The spark plug gaps are .025 inch.

STARTER.—Model M.H.-1025. Starter is connected to the engine through a Bendix drive. Starter cranks the engine at 150 R.P.M., taking 250-300 amperes.

Starter Data

Torque	R.P.M.	Amperes
2.0 lb. ft.	1160	110
6 lb. ft.	700	225
10 lb. ft.	460	325
12 lb. ft.	375	365
17.5 lb. ft.	Lock	600

Oiling.—Put 5 or 6 drops of light engine oil in the starter oilers every month.

GENERATOR.—Model GJ-1025-E. Generator current regulation is by the third brush system.

Generator Data

Amperes	Cold Test	R.P.M.	Amperes	Hot Test	R.P.M.
0.0		500	0.0		580
8		750	6		840
12		960	9		1050
16		1400	12		1360
16.5		1700	12.7		1700
12		3400	10		3400

Above readings are obtained with generator charging a battery of 1.300 solution.

Oiling.—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 9-10 miles per hour or 500-600 R.P.M of the generator armature and opens at 300-400 R.P.M. of the armature or 6-8 miles per hour. Relay contacts separate .030 to .045 inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dimmer lamps are 6-8 volt, 2 cp. Dash and tail lamps are 3-4 volt, 2 cp.

FUSE.—Lighting circuit fuse is 20 ampere.

PREMIER

MODEL 6-D (1923)

DELCO GENERATING, STARTING AND LIGHTING SYSTEM

DELCO IGNITION

PREMIER
Model 6-D (1923)
Delco System
Plate No. 819

BATTERY.—Willard, Type SJRN-4, 120 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 2159. Breaker contacts separate .018 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or on the flat side of an emery wheel finishing on a hard oil stone.

Oiling.—Put 4 or 5 drops of light engine oil in the distributor shaft bearing every two weeks. If the track of the rotor button is not well polished, apply a small amount of vaseline with a soft cloth. If the car is driven more than 500 miles in two weeks these attentions must be given every 500 miles.

Timing.—Breaker contacts begin to separate when the top dead center mark on the flywheel is 1½ inches past the indicator, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—Spark plug diameters are 7/8 inch. Gaps should be .025-.028 inch.

STARTER.—Model No. 194. Starter is connected to the engine through a Bendix drive. Starter cranks the engine at 120 R.P.M., taking 75 to 175 amperes at 5 volts. The direction of rotation is counter-clockwise, looking at the commutator end.

Starter Data

Torque.	R. P. M.	Volts.	Amperes.
0	4500	5.5	40-50
16 lb. ft.	0	3.4	450

Oiling.—Self oiling graphite bushings are used.

GENERATOR.—Model No. 195. Generator current regulation is by the third brush system, direction of rotation being counter-clockwise, looking at commutator end. The maximum charging rate is 16 amperes, reached at 1200 R.P.M. of the armature or 17 miles per hour, car speed in high gear. Motoring freely, the generator takes 3-5 amperes at 6 volts. The field current is 2 amperes at 6 volts.

Generator Test Data.

Amperes.	Volts	R. P. M.
3	6.6	600
6	6.8	700
9	7.0	800
11.5	7.2	900
17.5	7.5	1400

To adjust the charging rate, loosen the three screws which hold the third brush mounting plate and shift the third brush. Shift the brush in the direction of generator rotation (counter-clockwise) to increase the charging rate and in the opposite direction to decrease the charging rate.

Oiling.—Put 4 or 5 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted on generator frame. Relay closes at 8-9 and opens at 5-7 miles per hour. Relay contacts separate .046 to .062 inch. Air gap between relay armature (moving member) and coil core is .020 to .035 inch, contacts closed. To adjust relay, connect a voltmeter between the positive generator brush and ground. Then slowly speed up the generator and adjust the relay spring tension by turning the thumb screw until the relay contacts close when the voltmeter indicates 7.5 volts.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dimmer and tail lamps are 6-8 volt, 4 cp. Dash, parking, quarter and door lamps are 6-8 volt, 2 cp. Spot light is 68 volt, 20 cp.

CIRCUIT BREAKER.—A vibrating circuit breaker takes the place of fuses. It requires a current of 25 amperes to start this device vibrating. While vibrating, the current is 3-5 amperes.

R. & V. KNIGHT
Model H (1923)
Auto-Lite Systems
Plate No. 820

R. & V. KNIGHT

MODEL H (1923)

AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM AUTO-LITE IGNITION

BATTERY.—Willard, Type SJR-6, 6 volt, 152 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Breaker contacts separate .020 to .025 inch. They are made of tungsten. When the condition of the contacts affects the ignition, renew the contact screw and lever arm.

Oiling.—Screw up the grease cup under the breaker head one-half turn every two weeks. If the car is driven more than 500 miles in two weeks, this must be done every 500 miles. Put 3 or 5 drops of light engine oil on the wick in the breaker lever spindle every six months.

Timing.—Breaker contacts begin to separate when the top dead center mark on the fly-wheel is 1½ inches before the indicator, spark control lever and breaker assembly in the fully advanced position.

Firing Order.—The firing order is 1, 4, 2, 6, 3, 5.

Spark Plug Gaps.—Spark plug gaps are .025 to .030 inch.

STARTER.—Model ML-4091. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, viewed from the commutator end. Starter cranks the engine at 139 R.P.M., the current being 175 amperes at 5.3 volts.

Starter Data

Running Torque	R.P.M.	Amperes
2 lb. ft.	1600	135
6 lb. ft.	950	260
10 lb. ft.	610	365

Stalled Torque Data

Terminal Voltage	Stall Torque
2.0	10 lb. ft.
2.5	13 lb. ft.
3	16 lb. ft.
4	22 lb. ft.

The brush tension on the commutator is 2 pounds.

Oiling.—Put 5 or 6 drops of light engine oil in each of the starter oilers every month.

GENERATOR.—Model GJ-4020. Generator current regulation is by the third brush system. Maximum current output is 16 amperes, reached at 1700 R.P.M. of armature or 20 miles per hour.

Generator Test Data

Hot Test		Cold Test	
Amperes	R.P.M.	Amperes	R.P.M.
2.0	650	0.0	500
5.4	800	5.3	650
10	1150	12	950
12.6	1600	14	1150
12.3	2100	16	1700
11.6	2400	14.7	2500
